COPYRIGHT STATEMENT

The copyright law of the United States - Title 17, United States Code - concerns the making of photocopies or other reproductions of copyrighted material.

Under certain conditions specified in the law, libraries and archives are authorized to furnish a photocopy or other reproduction. One of these specified conditions is that the photocopy or other reproduction is not to be "used for any purpose other than private study, scholarship, or research." If a user makes a request for, or later uses, a photocopy or reproduction for purposes in excess of "fair use," that user may be liable for copyright infringement.

This institution reserves the right to refuse to accept a copy order if, in its judgement, fulfillment of the order would involve violation of the copyright law.

Notes From National and Nearby State Granges

Extracts Showing the Drift of Farmer Sentiment on Public Questions

THE Boston session of National Grange had 29 states represented, those not present being Minnesota, Kentucky, Montana, Wyoming. The attendance far exceeded that of any previous session and the total will not be reached again in many a year. On Friday, when the two seventh degree classes were worked, there were from 15,000 to 20,000 patrons in the city, while the class of 1918 seventh degree candidates breaks all records of the Grange, while impressive distinction is achieved by the Grange in the fact that this is the largest class ever initiated on a single occasion by any fraternal organization in the history of the United States.

Action was taken on the following questions: Favoring "open shop" with guaranteed right to every man to work at any time and in any place he pleases.

Pledged full Grange strength against Japanese immigration as a menace to the farming industry of the United States.

Demanding repeal of the law exempting "conscientious objectors" from war service.

Strong pronouncement against race track gambling in any state.

Reaffirmed positive opposition to any more "daylight-saving" under national or state plan.

Opposed Nolan bid for big taxation scheme on farms above \$10,000 value.

Reiterated Grange adherence to principle of arbitration, but without endorsement of League of Nations.

Demanding lowering of war tax on telephone toll messages.

Demanding repeal of guarantee feature of E. C. Cummins railroad rate bill.

Reaffirmed Grange tariff declaration of equal protection for agriculture with all other industries.

Urged that labor and special agitators who threaten the peace, property or life of others shall be promptly imprisoned or deported.

Strong stand for right of collective bargaining and co-operative marketing of farm products.

Urged uniform co-operative laws in all the states.

Demanding some form of short-time credit for farmers to aid production and marketing.

Favored declaration of public welfare, with secretary in the president's cabinet—preferably a woman.

Reiterated Grange demand for effective pure fabrics law.

Opposed all water power monopolies and urged the creation of co-operative hydro-electric associations.

Sounded clear note for personal and public economy, especially in government administration.

Reaffirmed opposition to Lane Plan, but favored legitimate reclamation work in any state that can stand on its own merits.

Denounced the cigarette evil and pledged Grange efforts to correct it.

Strong taxation declarations, including adequate income and inheritance taxes; opposed general sales tax and any form of classification of discriminatory nature.

Declared that natural resources still in public ownership should be retained there for the benefit of all the people.

Advocated more extensive investment in thrift stamps, war savings stamps and Liberty bonds.

Voted to assist in bringing to the United States the International Dairy Congress in 1922.

Called for farm production cost survey and full report for benefit of agricultural plans ahead.

Demanding limit on motor trucks run over the highways and fast destroying same.

Approved Near East Relief project, and recommended it to support of subordinate Granges.

Favored such operation of air-nitrate plant at Muskegon Shocks, as shall get best fertilizer results for the farmers.

Pledged support against "moonshine" traffic wherever attempted.

Favored reduced parcel post rate for library books carried on rural mail routes.

Advocate standard containers for handling of fruits and vegetables.

Strong declaration for enforcement of present pure food laws.

Emphasized urgent need of big agricultural man at the head of national department.

Favored working towards a Grange legislative and administrative home in the city of Washington.

Reaffirmed policy of co-operation with other farm organizations.

PENNSYLVANIA STATE GRANGE

Pennsylvania State Grange held its annual meeting at Allentown, December 14-16, 1920. The attendance was even larger than usual and the class initiated in the sixth degree was the largest in the state's history, numbering nearly 1000 members. The reports showed that 52 new granges had been organized during the year. Seven juvenile granges were started and one Pomona grange organized. The net gain in membership was 8000, bringing the total membership up to 82,000 in the state. The following extracts are gleaned from the Master's address:

Condition of Agriculture

Agriculture is facing the testing time in these years. Following the civil war, and in fact ever since the thought and energy of this country has gone toward the developing of our industry, corporate property has had continuous preference in partial release from taxation; tariffs have been made to encourage industry, while the farmer was compelled to sell his product on the world's market and buy his supplies in an artificial market.

The war brought the question of the Nation's food-basket to the attention of all our people. The intimation was made that the farmers were morally bound to produce food enough to go round. Responsible? Yes! to the soldier in camp and trench, but to highly paid industry not a mite. Responsible? Yes! to the starving, made so by the cruel hand of war, but to the short-hoored operators and workers in other lines of production not a bit. The farmer is organizing as he has never done before, and by so doing is serving timely notice on this nation that either he will have a square deal or our cities will not be talking about daylight-saving, but will be considering saving the time to go to the table three times a day. The United States Senate, the President and the bankers of this country have perpetrated a crime on the agriculture of this country that will not soon be forgotten by well-informed farmers. The President and Senate in not adjusting their differences and passing the League of Nations and the Treaty has cost the farmer already billions of dollars in the forced slump that has arisen because we are still technically at war with Central Europe; Austria longing for milk and our condensed milk piling up here; Germany wanting 2,000,000 bales of cotton, and the one-crop cotton farmer staring bankruptcy in the face because we are shut off from the export trade that Great Britain is now so fully enjoying; wheat of several hundred millions of dollars with the world reserves the lowest ever and the crop below the average. To spend a twelve month quibbling over "the League" or "a League" in a world crisis has only one parallel in history—when Nero fiddled while Rome burned.

The drawing away of labor and of farmers themselves from the farms to the city would seem to better the general condition because of the reduction of competition that would be incident to a larger number of farmers, but the real situation is rather the opposite. For many years the inducements that have held our people to the farms have not been of a monetary kind. There is a fascination in the contact with Nature; there is a lure in the touch with growing things; there is a joy in handling domestic animals and caring for their young; there is an independence in the individual character of the farmer's work; and there is a satisfaction in the freedom from the artificialities of the city that is attractive to country people, and we hope that the financial end of the business will ever be such that these worthy inducements, together with adequate remunera-

tion for his toil, will always be sufficient to keep the same high-class of proud Americans upon our farms that have always been the bulwark of the nation's strength. But when there are abandoned farms, when the population is dwindling, when it is difficult to get the proper number of scholars and taxables for good schools, when roads are neglected because of small traffic, then these who are left feel the added isolation, and the community is given over to some class of people who have never known the candid and wholesome kindred and social ties of a well-to-do country community.

Some of Our Problems

The National Board of Farm Organizations has made splendid progress. During the year the Florida Citrus Association, the Farmers' Equity Union, and the American Society of Equity have taken membership, and negotiations are pending which if successful will add another large bunch of co-operators.

The two large organizations that have not associated themselves with the Board, and which are necessary to the completion of the voice of agriculture, are the National Grange and the Farm Bureau Federation.

Some of us who have watched the developments in these organizations believe we know why they do not come in and add their prestige and power to the common voice. Certain leaders in the National Grange we feel are much more interested in being the spokesmen of a single organization than to take chances in emerging their identity in a board of possibly able men. The Farm Bureau Federation, with its new leadership, is still filled with the hope that its organization will absorb all the others and become the one farm organization of the Nation. The National Grange had that dream a few years ago, but the Grange died in four states this year, and possibly those who were thus dreaming are now thinking that they had the nightmare. The Farm Bureau leaders, when they are more experienced, will also understand the impossibility as well as the futility of such a hope and will then get their feet on the ground and assist in a get-together that will not lose the identity of any of the organizations.

Every influence that the farmer can bring to bear will be needed in Congress to enact the Capper-Hersman bill, to prevent the taking off the graduation of the income tax and the destruction of the excess profit tax, to secure an adequate nitrogen supply, to prevent the laying of monopolistic tariffs, and to secure fair play for farm products. The assumption that free raw materials are beneficial to the nation forgets the fact that the hide which is the shoemaker's raw material is the farmer's finished product, that the miller's raw material is the farmer's finished product and that the spinner's raw material is the farmer's finished product. We must help to establish a policy which will retain the control of our forests and waterpowers that are in public ownership; we must re-establish our canals for cheap transportation and build roads to move commodities rather than for pleasure; must find a solution for transportation better than is found in the Esch-Cummins law. These are just a few of the big national problems facing us.

Problems as pressing confront us in this state. In transportation we see not only rates the highest we have ever known and service mighty poor, but privileges we have enjoyed for generations taken away without consulting the public by operators who were not nearly so economical when the emergency was so much greater. Some of us who are opposed to Government ownership are dumb-founded these days to think that we have to continue the operation of our railroads in the hands of the Executives, who though shifted around some, still handled the roads during the war.

Among the problems of interest to us in the State Legislature will be the repeal of the Brooks' High License Law and pass an enforcement law that will accord with the National Legislation.

(Continued on Page 14).

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

NITROGEN IN RAIN AND SNOW

THERE seems to be some ground for the belief that winters of heavy snow fall are followed by good crop seasons. If this is true, then snow must have some properties of a direct or indirect fertilizer. It might be a direct fertilizer in the sense that it contains ammonia or other plant-food ingredients. It might be indirectly helpful by covering the fields with a protecting blanket that prevents damage to winter grain.

Students of soil fertility have been examining rain and snow in different localities for the purpose of finding out accurately how much fertility and what kinds of fertility these may be able to contribute to the land. The investigations on this subject go back to the early part of the Nineteenth Century when chemists tried to discover how much ammonia was contained in the air or to what extent such ammonia was usable by plants. For nearly a whole century chemists in France, Germany and England studied and debated this subject. Many of them believed that the supply of ammonia in the air was sufficiently large to furnish crops with all that they needed. In order to obtain reliable information on this subject, there have been established in a number of places in this country and abroad so-called lysimeters. Lysimeters are metal or concrete boxes or cans so constructed as to allow the collecting of the rainfall that passes thru the soil contained in them. These lysimeters have a

Ayrshire Bull Well Posed Makes an Attractive Appearance.

known area, so that it is possible to determine accurately the amount as well as the composition of the rain and snow that may fall on their surface. The lysimeter studies in different localities show that in regions where the annual rainfall is about thirty inches the amount of nitrogen per acre brought down is about four to six pounds. In some localities or in occasional seasons the amounts may be considerably larger, up to twelve or even fifteen pounds per acre. However, the average amounts, as indicated above, would be nearer four to six pounds per acre. Of this nitrogen about one-quarter to one-third is present in the form of nitrate and the rest in the form of ammonia. The question naturally arises whether this amount of nitrogen plays any significant part in maintaining a sufficient supply of this constituent in the soil. If there were such a thing as the accumulation of nitrogen, the continued addition of five pounds an acre would in the course of many years lead to the formation of a very substantial store of nitrogen in the soil. Unfortunately, however, the average acre of land loses much more nitrogen in the drainage than is contributed to it by the air. The analysis of drainage water show that in the humid region the drainage waters may carry away 25 to 30 pounds of nitrogen per acre. Occasionally the loss may be very considerably larger. Evidently, the addition of five pounds of nitrogen per acre is but a slight offset to the loss of 25 to 30 pounds of nitrogen per acre on cultivated land. While the contribution of ammonia and nitrates from the air is, therefore, not sufficient for maintaining a sufficient supply of nitrogen in the soil, it is more or less of an acid in helping to conserve an adequate supply of nitrogen in the soil. Other means

must be found for restoring more adequately the losses just noted. The laying of the land down to grass so as to decrease the amount of drainage water passing thru the land, as well as to decrease the amount of soluble plant-food carried away by drainage waters, is one of the means for checking the too rapid shrinkage of the nitrogen supply in the soil. Even more effective is the growing of crops that have the ability to use thereby the nitrogen content of the land. These crops are far more important than rain and snow

Guernsey Cow Nearly Dry, Yet Showing to Good Advantage.

as a factor in increasing and maintaining a sufficient supply of nitrogen in the soil.—J. G. Lipman.

Photographing Dairy Cattle

It is the usual practice when one has dairy cattle for sale to keep on hand a supply of pictures for the prospective purchaser in case he cannot personally see the animals. Too often, though, unless there is an experienced animal photographer available no pictures are taken as the average breeder thinks that the chance of getting a good picture is too uncertain or that the task is too difficult for him to undertake. After a little practice, however, most any one can take satisfactory pictures of dairy cattle providing he realizes that the object of the picture is to show the more important things which one would look for if he could examine the animal personally.

With this in mind the following points are suggested as being desirable to keep in mind in the photography of dairy cattle.

1. The picture should show the animal as natural as possible.

2. A few minutes used in brushing the hair and combing the switch will be well spent. If possible clip the long hairs on the udder and belly to better show the shape of the udder and size and length of milk veins.

3. A side view is most desirable in order to show the top line, length of body, appearance of head and mammary development.

4. Choose a background that will not distract one's attention from the picture of the animal.

5. Do not use a background of anything that has lines that run parallel with the animal's back, as the straight lines may bring out too prominent-

Poor Picture of a Tynp Brown Swiss Cow. Cow Standing on Sloping Ground Together With Line Parallel to Back Makes Top Line Appear Weak. Well Shaped Udder Does Not Show.

ly an apparent weakness in the back or drooping of the rump which may not be a severe defect in the animal's conformation.

6. Be sure the animal stands on level ground and that the feet are so placed that all can

be seen from the camera with one hind foot far enough behind the other as to show the shape of the udder and placement of teats.

7. To best show the side wedge of barrel and emphasize the depth of rear abdomen of the dairy cow, place the camera closer to the rump than the head. When photographing a bull place the camera closer to the head, thus emphasizing the masculinity as indicated in the fore quarters.

8. Just before the picture is taken attract the attention of the animal so that the head will be held up and turned slightly toward the camera showing the appearance of the face.

9. Choose a bright day as it insures a more distinct picture showing the animal to greater advantage.

10. It is much easier to tell how a picture should be taken than it is to take it. The ability to secure good pictures requires patience with the animal and skill in getting them to stand correctly.

11. It does not pay to retouch pictures. It is better not to make a sale than it is to sell on the strength of a retouched photograph and take chances of making a dissatisfied buyer.—A. L. Beam, State College, Pa.

POISON BAIT, RIGHTLY USED, KILLS RATS

With the time at hand when rats flock to the barns, poultry houses, and to the cellar if they can, many farmers are asking what they can do to get rid of the "pesky nuisances."

Poison bait is said to be the best way to deal with the rat nuisance. But rats soon learn to avoid any particular kind of poisoned bait, and therefore they should be given a variety. One should use at least three different kinds of bait and more if convenient—one a grain, one a meat or cheese, and one a vegetable.

It is better to offer them the bait without

Undesirable Background Distracts From Heifer Appearance.

poison first and then alternate poisoned and unpoisoned until the rats are killed. A formula for killing rats recommended by the biological survey of the United States Department of Agriculture is made by mixing one part of barium carbonate to four parts of bait or, if it cannot be conveniently mixed, sifting it over the surface of the bait and rubbing it in.

Since barium carbonate is poisonous to children and domestic animals, care should be used in placing it. The bait should be inspected daily and any not eaten replaced by a bait of another kind.

One thing which needs pointing out, is that even if one's buildings are rat proof, if the rats are permitted to breed anywhere on the premises there will be trouble.

ALFALFA, \$83 AN ACRE

Seventeen acres of alfalfa grown by J. C. Beeton, Coleman Switch, Kansas, produced about seventy tons of hay last summer. The crop was all No. 1, and worth \$1500 when harvested and put into stacks. There were four cuttings, which was not unusual for that part of the country. The hay was sold loose in the stack. Mr. Beeton and his sixteen-year-old son harvested all the crop, cut it and stacked it without rain doing any damage. The total yield averaged a little more than 17 tons to the acre, and this sold for better than \$20 a ton. Where can you get a crop that will beat alfalfa?—E. A. Kirkpatrick.

It is declared that the bagpipe is the oldest musical instrument in the world. That must be why its joints squeak so.—Los Angeles Times.

 —The Editors

Righteousness is even more needed than prosperity.

Profitable Pastime

WE START the New Year with the prospect
 of more nearly normal conditions in trade
 and transportation than have existed for several
 years. We believe it will be possible to get farm
 supplies with reasonable certainty and promptness
 but in spite of this prospect we would urge
 the farmer to place orders. Fore-handled farmers
 endeavor to plan their year's work early in
 the year and secure full information on the sup-
 plies which they will need. There is no more
 profitable work for the winter months than a
 careful study of farm books, farm papers and
 last but not least, catalogues and price-lists. The
 art of advertising has reached such a high de-
 gree of excellence that a careful study of adver-
 tising matter is well worth while for the infor-
 mation received. As one subscriber recently
 wrote: "I frequently learn as much from read-
 ing advertisements in a magazine as I do
 from a text matter." Even though it is likely
 that freight and express will be moved with
 greater promptness than in the past, orders for
 implements, supplies, etc., should be made out
 early and sent in so as to be on the safe side.
 General practice of this advice will also help to
 keep the wheels of industry running and lessen
 the danger of a business stagnation.

Learn To Keep The Law

IN SUMMING up the moral and religious status
 of the people at the close of the year, concern-
 ed investigators find little to encourage them in
 this respect. Contrary to a very popular belief
 during the war, the experiences and results of
 the conflict did anything but increase moral-
 ity, reverence and religious fervor. Thoughtful
 people of all classes, whether their profession is
 that of the church or not, are seeking to find
 the cause of the present condition and a remedy
 for it. Many are of the opinion that the prin-
 ciples of morality and even of religion itself have
 been so superficially taught and too lightly re-
 garded during the past generation or two. The
 tendency seems to have been to make life as
 easy as possible and to relieve the individual of
 definite responsibility. We need a revival of the
 old-time appreciation of character and of the
 principles of which character is developed. It is
 no more possible to develop manhood and woman-
 hood if real worth without the practice of self-
 denial and the control of impulse than it is pos-
 sible to grow a crop of corn without the appli-
 cation of intelligent labor. Without the quali-
 ties that result as a practice of these virtues the

Pennsylvania Farmer

individual is like a boat without a rudder—cast
 this way and that with every wind and wave.
 Let us teach with a greater definiteness that "Sin
 is the transgression of the law and sin, when it
 has conceived, bringeth forth death."

The Dawning

IN SPITE of the dark financial skies and the
 muzzling heard on every hand there are
 many signs that the dawning of better times is
 at hand. The rapid reduction in commodity
 prices forecasts more general buying and this in
 turn will stimulate production which has been
 greatly reduced during the last six months. When
 the public got over its spree of reckless buying
 at profiteering prices some six months ago, and
 realized its prodigal practice, it suddenly quit,
 leaving immense quantities of goods which were
 produced at high cost and marked up at war
 prices on the shelves and in storage houses. Cancellation of orders became a common practice be-
 cause retailers found they could not dispose of
 goods at old prices. It is estimated that the mer-
 chandise in warehouses, piers and railroad cars
 held because of cancelled orders would amount
 to three billion dollars. The only reason it has
 not moved on to its destination and into the
 hands of consumers is because the public rebelled
 against prices.

But the old prices are giving place to new
 and lower prices. The goods are needed and will
 be purchased as soon as this takes place all along
 the line, provided the public does not lose its
 buying power thru unemployment. There is light
 at the horizon. The dawn gives evidence of be-
 ing at hand by the lowering of prices in every
 line, and as soon as the holiday season is past it
 is almost certain that we will see a decided drop
 and a resumption of normal buying. No sensible
 manufacturer or merchant expects the prices of
 1917 to 1920 in prevail in 1921, and it would be
 equally foolish for farmers to expect it in their
 business. While the slump hit the farmers first,
 every business is sooner or later affected in the
 same way and in the end a common and fair price-
 level will be established. The only thing needed
 to restore normal conditions is for everyone to
 keep on producing, charge fair prices and prac-
 tice steady, sane buying.

Editorialets

WE DOUBT very much the efficacy of the cur-
 rent bills being introduced in Congress for the
 relief of agricultural conditions. With the
 superficial knowledge at hand and in view of the
 world's trade condition and its cause, the pro-
 posed tariff increases on agricultural products, the
 talked-of embargoes, and the changes in the Fed-
 eral Reserve Bank's policies appear to us as quack
 remedies. They will not relieve the situation and
 may compromise farmers at a later date.

All who heard Commissioner Pinchot's report
 at the Pennsylvania State Grange are no doubt
 better informed as to the present condition of
 the Forestry Department as well as to the im-
 portance of developing state forests than they
 ever were before. The American peoples' hand-
 to-mouth policy in supplying their needs from
 the natural resources, together with their gross
 carelessness and criminal waste, has brought them
 face to face with a lumber famine. Since the
 country's consumption of lumber is four times
 the annual growth at present it does not require
 even a son of a prophet to foretell what is com-
 ing unless there is a speedy change in practice.
 It is another illustration of our hind-sight being
 better than our foresight.

The man or woman who has no other motive
 in taking products to a fair or products show than
 merely to get a prize fails to get the best out
 of such an opportunity, even though they receive
 the first premium.

It is at least encouraging to learn that the
 chairman of the Association of Railway Execu-
 tives says he knows of no movement on the part
 of railroads to ask for an increase of rates in the
 near future. Perhaps this concession is as much
 as the public could expect, but we must remem-

ber that since the railroads have the govern-
 ment's guarantee of a minimum rate of income
 the public is in for making up a deficit of about
 \$600,000,000. In the light of this fact their
 magnanimity shrives.

In spite of the discrepancy in incomes of farm-
 ers, and tradesmen and laborers during the past
 three years the average farmer is better off at
 the beginning of the year 1921 than is the aver-
 age man in other callings. The present period
 of depression shows that the big wages were,
 in most cases, spent as fast as they were made
 and tens of thousands of the prodigates are out
 of money and out of a job. On the other hand,
 the farmer has his job, a good living and a rea-
 sonable certainty of good times ahead.

It is again time to call attention to the ad-
 visability of taking a farm inventory and start-
 ing a simple but comprehensive system of keeping
 farm accounts. We are convinced that it is not
 because the proposition is impossible but it is
 because farmers, having never practiced it, are
 neglectful in the matter of setting down each
 evening the transactions of that day. Try it this
 year and see how satisfactory and profitable the
 practice is.

Our Washington Letter

After a lengthy debate the House passed the
 Fordney emergency tariff bill Wednesday night,
 by a vote of 196 to 86. It was supported by
 many representatives from the Southern States
 west of the Mississippi and was opposed by sev-
 eral congressmen from Eastern industrial centers.

It was admitted by Representative Fordney,
 of Michigan, who reported the bill out for the Ways
 and Means Committee, that it was not scientific,
 but he maintained that it would afford the farm-
 ers and stock raisers immediate relief and save
 agriculture. It imposes high tariff duties on some
 twenty agricultural products for a period of ten
 months, by which time, it is believed Congress
 will be able to enact a scientific tariff similar to
 the Payne-Aldrich schedules.

The opposition declared that the measure,
 which provides higher tariff rates on some prod-
 ucts than the Payne-Aldrich law, will not help
 the farmers, and that its only effect will be to
 give the retailers opportunity to boost living
 costs. Several Eastern members who voted for
 the bill, opposed it on the floor of the House,
 saying they would not vote for it if they had the
 remotest idea that it would be enacted into law.
 The opinion is quite strong in and out of Con-
 gress that the farmers' relief tariff bill will not
 pass the Senate.

The American Farm Bureau Federation is
 backing a plan, which includes the granting of
 American credit to Germany of around one bil-
 lion dollars, to be authorized by the reparations
 committee under the Treaty of Versailles. It is
 proposed to amend the War Finance Corpora-
 tion measure so as to make this proposition ef-
 fective. It is claimed that sentiment is quite
 strong in both branches of Congress for a move
 of this kind. President J. R. Howard and other
 federation officials are in Washington for the
 purpose of studying and developing this plan and
 explaining the proposition before the House and
 Senate Committees on agriculture and banking
 and currency.

The present emergency tariff bill prescribes the
 following rates of duty on farm products: Wheat,
 30 cents per bushel; wheat flour, 24 per cent ad
 valorem; corn, 15 cents per bushel; beans, 2
 cents a pound; peanuts, 3 cents a pound; pota-
 toes, 25 cents per bushel; onions, 40 cents per
 bushel; rice, 2 cents per pound; lemons, 1 cent
 per pound; peanut oil, 26 cents per gallon; cot-
 tonseed, coconut and soy bean oil 20 cents per
 gallon; cattle, 30 per cent ad valorem; sheep, 32
 per head; lambs, \$1 per head; fresh mutton and
 lamb, 21 cents per pound; cotton, 7 cents per
 pound; manufactures of cotton, 7 cents per pound
 in addition to present rates; wool, unwashed, 15
 cents per pound, washed, 30 cents per pound,
 scoured, 45 cents per pound; manufactures of
 wool, 45 cents per pound in addition to the rates
 of duty now prevailing. This tariff is to remain
 in force for a period of ten months.

In the House conference a California con-
 gressman, asking for a tariff of eggs and frozen
 meats, said the California poultry men were be-
 ing driven out of business by importations of
 cheap eggs from China, and that meat producers
 were being crowded out by heavy importations of
 frozen and refrigerator meats from Australia and
 New Zealand.

The Young-Tincher bill to use \$100,000,000 of
 the profits of the Federal Reserve Board system
 in loans to live stock owners, is one of the lead-
 ing propositions by which farmer leaders in Con-
 gress are attempting to relieve the farm credit
 situation in the West.

January 1, 1921.

The Washington representatives of the farm-
 organizations feel that the Capper-Volstead bill
 designed to establish the legality of farmers' co-
 operative marketing associations, as passed by
 the Senate, leaves much to be desired. The opin-
 ion is freely expressed that it will hinder instead
 of promote co-operative marketing. One man, who
 is the head of a large California co-operative mar-
 keting association, says this measure will put
 out of business every market milk producers' as-
 sociation and several of the co-operative mar-
 keting organizations in California.

The American Farm Bureau Federation Wash-
 ington office is directing its attention to the
 three things necessary to relieve the situation—
 a tariff to keep foreign grown products out, ex-
 tension of credit to farmers until there is a re-
 adjustment of prices and market conditions, and
 a buying campaign. The country is now up
 against a buyers' strike. Anything that can be
 done to encourage more extensive buying will
 afford a degree of relief. In the case of wheat,
 millers and bakers are down to the bottom of
 the bins. A "buy a barrel of flour" movement
 if it would soon create a demand as large as at
 the farmers' throut the country would each buy a
 barrel of flour, it would greatly help the market
 situation.

The Bureau of Animal Industry calls attention
 to the fact that of the 695,364 cows officially
 tested for tuberculosis during the last fiscal year,
 28,616 reacted, and were removed from the herds
 tested. The number of herds accredited as free
 from the disease was three times as large as at
 the end of the year as at the corresponding time
 a year ago.

The "Better sires, better stock" campaign pro-
 moted by the Bureau of Animal Industry, is being
 pushed vigorously all over the country. It is the
 aim of the movement to get rid of inferior sires.
 The state extension forces and farm bureaus are
 co-operating with the bureau in this work. The
 bureau now has on file 3,200 names of live stock
 owners who have signed an agreement to keep
 pure-bred sires for all kinds of stock they raise
 and to follow breeding methods leading to fur-
 ther improvement. These men own collectively
 400,000 head of live stock. Virginia, Pennsyl-
 vania and Nebraska are especially active in live
 stock improvement. The movement has also ex-
 tended to Porto Rico and the island of Guam.
 Two associations in Rhode Island are working
 to rid the entire state of scrub animals.—Elmer
 E. Reynolds.

HARRISBURG LETTER

Agricultural Recognition.—More extended
 recognition for the work the State Department of
 Agriculture is doing for the advancement of food
 production in Pennsylvania along educational,
 supervisory and research lines will be asked of
 the next Legislature. The Governor plans to deal
 with the department on a basis that will make it
 rank with the educational, highway and welfare
 activities of the state and to ask that appropri-
 ations to enable it to continue its work and to
 take an advanced position in various branches of
 helpful endeavor be voted. The Governor, who
 owns several farms and is heavily interested in
 Pennsylvania orchards, has been personally ob-
 serving what is being done in the way of en-
 abling people in charge of such enterprises to
 market products, combat pests and secure seeds,
 fertilizers and other supplies as paid for. The
 Governor has also followed closely the surveys
 which Secretary Fred Rasmussen has conducted
 and which are bringing to the farmers and busi-
 ness men of the state the facts regarding food
 supply and the great necessity of closer relations
 between the men who handle food and finances
 as well as the development of local markets.

Educators Have the Field.—Educators of the
 state have the field this week and considerable
 ventilation of the school system of the state, to-
 gether with some plain speaking regarding the
 teacher situation, the conditions in rural dis-
 tricts and other salient matters, appears to be
 the order of the day. Dr. Thomas E. Finegan,
 the state superintendent of public instruction, has
 taken occasion to call attention of the educators
 to the fact that no districts can be taken by the
 back of the neck and forced into consolidations,
 and that it is a matter of local self government
 for the people who pay the bill. The state, how-
 ever, will show as far as able the business side
 of it from the broader standpoint of the Com-
 monwealth.

Assembling the Laws.—The meeting of the
 teachers and some sessions proposed by repre-
 sentatives of the third class cities, the boroughs and
 the first-class townships will probably lead to
 some definite positions being assumed regarding
 new laws and from all accounts the next Legis-
 lature will be asked by people from the home
 districts to line up for changes. Just how far
 the officials of the boroughs' organization will get
 in their effort to clip the wings of the Public
 Service Commission is doubtful. They undertook
 something like that against the commissioner of
 health some years ago, but found the Governor
 had the "last bats" to use a baseball term. Some
 very useful codifications of the laws are being
 drawn up and there will also be started a move-
 ment to assemble all the laws of the state.

Pennsylvania Farmer

The State Milk Law.—Men interested in a bill
 to regulate milk in Pennsylvania will meet again
 in Philadelphia next Wednesday to discuss the de-
 tail of heat for pasteurization of milk, this being
 the one phase of discussion not completed at the
 conference here several days ago. There will be
 three grades of milk in Pennsylvania, certified,
 grade A or that from herds officially pronounced
 free from disease, and pasteurized milk. The De-
 partment of Agriculture will have charge of dairy
 inspection as far as the animals are concerned,
 but once a cow is milked the State Department of
 Health will supervise the product. This is work-
 ing out something which has been sought for
 years and which was nearly accomplished two
 years ago. State officials here are confident
 some agreement will be made with all in-
 terested parties and the law be passed without
 trouble.

The State Fair.—Pronounced impetuosity
 will be given to the State Fair proposition when
 the State Farm Products Show is held here next
 month. The show is going to be on a scale be-
 yond anything ever attempted and a bill for the
 state fair is said to be under preparation by in-
 terests not connected with the State Government.

Half a Million in Sight.—More than half a
 million acres of Pennsylvania desert can be
 bought by the state at rock bottom prices if the
 next Legislature is in tune with the conservation
 plans being discussed here. This land is mainly
 on mountains and hills and has an enormous
 potential value for lumber and water. Much of
 it has been actually offered to the state and the
 rest is available.

Fifteen Thousand Listed.—The State list of
 plants has been run to about 15,000 specimens and
 it is hoped in the next year or so to list every-
 thing native to Pennsylvania. The state plant
 thing native to Pennsylvania. The state plant
 industry and botanical authorities have made a
 drive against the weeds and valuable work to
 identify nuisances has been carried out.

Woman Can Hold Office.—Probably the most
 important decision in regard to public offices has
 just been given here by the new Attorney Gen-
 eral, George E. Alter, which officially determines
 that women are eligible to public office in Penn-
 sylvania. Several questions, which appeared for-
 midable, were raised, but Mr. Alter adopts the
 simple plan that the amendment changed it all
 and put women on the same basis of responsibil-
 ity as men.

Farm Work Hurts Attendance.—From all ac-
 counts, work on the farm is being unusually
 helped by the weather and farmers have been
 able to get labor without much effort for the
 first time in many months. December plowing
 has been going on in some southern counties and
 clearing up that was retarded by lack of labor
 in the summer and fall is going thru while spring
 preparations are moving on. The state of work
 has, however, materially affected attendance at
 farmers' institutes.

NEW YORK LETTER

Moving picture Shows Markets.—The State
 Division of Foods and Markets has completed a
 moving picture which will educate consumers as
 to the channels of transportation and distribu-
 tion thru which fresh fruits and vegetables pass
 before they reach the city table. The congested
 night markets in New York city are shown, the
 railroad piers, farmers' markets, the rushing long
 shored men and jobbers, retailers and truck drivers
 which hustle the food thru the city while the lat-
 ter sleeps. The film will be free to picture thea-
 ters, civic organizations and schools. Groups in-
 terested in securing it may write the Division at
 50 West Broadway, New York City. It will be
 a valuable help in bringing farmers and city peo-
 ple to a better understanding.

Survey of Rural Schools.—A survey of rural
 school conditions in one average county of the
 state has brought out such startling conditions
 that the joint committee on rural schools, with
 private funds, has hired one of the most noted
 educational experts of the country to make a
 wider survey for the guidance of the committee.
 The latter is working in full co-operation with
 farmers, and great results are expected to come
 from the investigation.

Rural Health Centers.—The coming Legis-
 lature will again be presented with a rural health
 center bill, which would create a health center
 in each rural community large enough to war-
 rant it, with specialists to diagnose disease and
 prescribe treatment, which may be carried out by
 local doctors. At a recent conference of 27 so-
 cial organizations the bill was discussed, and farm
 leaders were doubtful of its interpretation, that
 some rural people greatly need more adequate
 medical service. The handicap such an arrange-
 ment would meet would be the scarcity of spe-
 cialists and nurses and the absence of any state
 institution for the training of such workers. In
 one such health center in the state over 60,000
 people receive free medical advice annually.

Milk Matters.—At the first meeting of the new
 board of directors of the Dairymen's League a new
 president for the League was elected to succeed
 R. D. Cooper, who has served four years. The
 new leader is G. W. Slocum, of Milton, Pa., own-
 er of 3000 acres of land and 150 dairy cows in

Wants U. S. to Quit Barge Canal.—New York
 wants Federal control of the barge canal removed
 and barges now in operation sold to private cap-
 ital for continued operation. The state wants
 to develop the waterway which has so far been
 a useless but huge expense.

Free Mail Courses in Farming.—The State
 College at Ithaca is to give residents of the state
 free mail courses in agriculture in eight lines of
 farming. The only expense will be for text books.
 Advanced courses are also given and the regular
 college experts will correct the papers of stu-
 dents.

Fertilizer Question.—Farmers are worried not
 to buy fertilizers at the present exorbitant prices.
 Geneva Experiment Station finds that corn alone
 would have to bring \$11 to \$15 a ton in the field
 to make good on fertilizers bought at present
 prices, and oats would have to bring \$2 a bushel.
 These prices for fertilizers are unwarranted with
 the present outlook for farm crops.

Pennsylvania and New York.—The January price
 of milk to farmers, will be \$3.18, or the same
 as in December. This is an average price of
 \$0.727 per quart for average milk, and is at least
 a cent a quart under the actual cost of produc-
 tion. The pooling plan will be pushed as rapidly
 as possible.

Opposed to Excess Profits Tax Repeat.—H.
 E. McKenzie, a New York farm leader and chair-
 man of the American Farm Bureau Federation,
 opposes repeal of the excess profits tax, and the
 proposal of a sales tax, as being one based on
 consumers who cannot afford to pay. Only cor-
 porations are advocating the repeal, as the busi-
 ness wants to shift the tax to consumers.

Canning Crops Growers' Plans.—The work of
 developing the organization of canning crops
 growers has grown rapidly and expansion and
 perfection of the organization is the immediate
 program. An expert manager of the organiza-
 tion is to be hired, to devote his whole time to
 looking after the interests of growers.—G. E.

NEW JERSEY NEWS

Christmas Dinner Expensive.—Stork, and
 for the good things that went to make up the
 Christmas dinner of the average person in New
 Jersey caused the dealers to keep up the prices
 around previous high levels, and the result was
 that the feast was expensive. Jersey turkeys were
 somewhat scarce in various parts of the state.
 They retailed at from 70 to 72 cents a pound with
 exceptionally fine birds bringing as high as 80
 cents. Maryland and Western turkeys were brought
 in the markets for from 63 to 75 cents per pound.
 Ducks cost from 50 to 55¢. Ducks cost 50¢.
 Chickens cost from 45 to 50 cents per pound.
 The markets were replete with fine chickens and
 geese for from 45 to 50 cents per pound.
 The markets were replete with fine chickens and
 geese for from 45 to 50 cents per pound.
 The markets were replete with fine chickens and
 geese for from 45 to 50 cents per pound.
 The markets were replete with fine chickens and
 geese for from 45 to 50 cents per pound.

Illustrating Jersey Trees.—In order to pro-
 mote interest in local forestry, the New Jersey
 State Museum located in the State House at Tren-
 ton in co-operation with the State Department
 of Forest Conservation has made up several
 charts, which illustrate the trees of New Jersey.
 These charts are being used by the schools and
 community centers of the State in connection with
 other lending sets of the museum. They have
 been arranged by Miss Katherine Grayson, acting
 curator of the museum. In the special group
 of charts each one illustrates the foliage and
 fruits, a cross section of the wood, and a leaf
 made of the trees showing the grain of the wood.

Legislation Against Foxes.—Encouragement of
 the existence of foxes in New Jersey may be elimi-
 nated by legislation enacted at the 1921 session
 of the State Legislature opening here on January
 11. Several men of prominence are opposed to
 the raising of foxes in the state. Senator Hagaman,
 of Ocean County, in which is located the
 New Jersey State Game Farm, has declared that
 "the fox menace has become such in the State
 of New Jersey, that every means should be taken
 to exterminate the vermin." The Senator added
 that "in northern Jersey, there is a large class
 which actually encourages foxes to live. While
 I appreciate the pleasure that some people
 get from their sport, it seems to me that it ought
 to be secondary to the common weal. Good sports-
 men and farmers alike demand that something
 be done to remedy the evil." In reply to the com-
 ments by Senator Hagaman, Ernest Napier, pres-
 ident of the State Fish and Game Commission, has
 stated that club conditions in regard to foxes
 in New Jersey have been greatly improved.
 "When we looked into the matter some time ago,"
 said the commissioner, "we found that this club
 was turning loose sixty or seventy foxes a year.
 A law was passed in 1919 prohibiting the keep-
 ing of foxes in captivity or liberating them, but
 there is still much work to be done along this
 line.—Kelly, Trenton, Dec. 27.

"I can't understand," said the tactful youth,
 "why you two girls are so inseparable, when one
 of you is so beautiful and the other is so homely."
 "Whereat each of the girls went home looked
 in the mirror, and felt sorry for her companion.
 —Life.

Protected from Winter Blasts

With an IDEAL-Arcola Heating Outfit the farm home becomes the equal of the finest city mansion.

All rooms are heated from one fire and with great fuel saving—outlasts the building—no other feature or equipment of a home will do so much for yourself and your family. An IDEAL-Arcola is an investment and not an expense.

IDEAL-Arcola Heating Outfits

Any Dealer will furnish in sizes to suit rooms and climatic conditions.

For Soft Coal	No. 1-B Size IDEAL-Arcola with 100 sq. ft. of Radiation	\$142
	No. 2-B " " " " " " " " " " " "	176
	No. 3-B " " " " " " " " " " " "	213
	No. 4-B " " " " " " " " " " " "	251
	No. 5-B " " " " " " " " " " " "	290
For Hard Coal	No. 1-A Size IDEAL-Arcola with 135 sq. ft. of Radiation	\$163
	No. 2-A " " " " " " " " " " " "	209
	No. 3-A " " " " " " " " " " " "	251
	No. 4-A " " " " " " " " " " " "	285
	No. 5-A " " " " " " " " " " " "	349

Prices include Expansion Tank and Drain Valve. Prices do not include labor, pipe and fittings used in installation and which are supplied by the local dealer at extra charge. Radiation is of regular 38-in. height 3-column AMERICAN Peerless, in sizes as needed to suit your rooms. Outfits shipped complete, i. e. b. our nearest warehouse, at Boston, Providence, Worcester, Springfield (Mass.), Albany, New York, Philadelphia, Harrisburg, Pittsburgh, Baltimore, Washington, Richmond, Buffalo, Cincinnati, Indianapolis, Birmingham, Detroit, Chicago, Milwaukee, Minneapolis, St. Paul, Des Moines, or St. Louis.

Shipped complete for immediate installation

The beauty of the IDEAL-Arcola method is that no cellar is needed. Everything is on one floor. The Arcola is placed in any room that has a chimney connection. No running to cellar. Same water is used over and over again for years. No fire risk.

Buy now at present attractive prices for outfits complete!

IDEAL-Arcola outfit consists of the boiler and radiators to heat various size houses. Write us your requirements! Unlike stoves, there are no coal-gas leaks into the living-rooms. The IDEAL-Arcola delivers the soft, radiant warmth of hot water—not the dry, burnt-out atmosphere of stove heating. There is no fire risk to building—no danger to children—fire lasts for hours! The Arcola burns hard or soft coal.

The outfit consists of an IDEAL-Arcola Radiator-Boiler and 4, 5, or 6 AMERICAN Radiators and Special Expansion Tank—everything except labor, pipe and fittings, which any local dealer will supply. See table above for various sizes and prices of outfits.

Catalog showing open views of houses, with the IDEAL-Arcola Boiler in position will be mailed (free). Write today. Sold by all dealers. No exclusive agents.

We will teach you to operate and to repair Tractors, Trucks, Pleasure Cars, Gasoline Engines and Farm Machinery 3 months' day course. Classes begin Monday January 3rd and January 31st.

Y. M. C. A. Automobile School 1421 ARCH STREET PHILADELPHIA

A Review of the Year

By FRANK P. WILLETS, Pres.

THE basic price was maintained at nine cents f. o. b. Philadelphia from the time of our last annual meeting until August first, though there was a period when the proper spread between this price and the price of surplus should have been wider. On the latter date the basic price was advanced to 10c in the expectation that market conditions would remain fairly normal at least till after the New Year. But the unexpected happened and we met to-day in the shadow of a radical price decline of 2c per quart just at a season when production costs are generally the highest in the whole year. There are at least three factors which helped to make imperative this unfortunate price decline. (1) The unusually open and moist weather, making unprecedented fall pastures and the consequent greater production. (2) The continued lack of buying power in Europe as shown by the present low rates of exchange, which condition has reduced the exports of condensed milk and other products. (3) Present business stagnation and the collapse of almost all food prices. For instance, sugar, the price of which has fallen from 26c to 10c and less, enters largely into the production of condensed milk and the present stocks of sugared condensed will therefore be necessarily sold at an enormous sacrifice.

Surplus Plan

The prices actually received for milk by individual members during the year have depended on the comparative amount of surplus. The actual results of this plan can be explained by quoting from the paper I read at the recent annual conference of the National Milk Producers' Federation in Chicago. "We feel that, in the long run, the plan has been a good one. Taking it on the average over the year, nobody has lost any money. Many have gained. Some few, who produced only summer milk, that is shipped no milk at all in the fall of 1919, on which a basic quantity could be established, may have been a little behind, but we are not ready to say that they lost anything, because, without the plan, the price of basic milk would not have been as high as it was. We realize that under this plan we have relinquished the trump card, scarcity of production, particularly in the fall months, to aid us in obtaining a higher price. At the same time it must be remembered that it removes the same factor on the part of the dealer who lost his customary surplus argument to beat the price paid producers down during flush supply periods."

We have heard some criticism that the surplus plan was responsible for the present market conditions. One might admit this if it were not that these conditions obtain all over the country regardless of marketing systems employed.

Condensary Situation

Ever since September, the condensary situation has been extremely

unsatisfactory to both producer and manufacturers. Before the war less than 3 per cent of the total milk production of the U. S. was condensed. Last year it was almost six per cent. Of this latter amount perhaps two-fifths was for export. The remainder was consumed in the home markets. The present surplus of condensed milk in domestic markets on our hands by lack of export this past year represents one-half of this amount of one-fifth of the total amount canned. We therefore have in this surplus (one-fifth of the total condensed milk produced), only a little more than 1 per cent of the total production of the U. S. But this one per cent has been enough to demoralize the markets of the whole country, as the condensaries, in order to get large plant volume, have located in the very heart of the great dairy districts in the East, the central and the western parts of our country. It's a very definite case of the "tail wagging the dog."

Because of the relatively small volume of this surplus, the recovery of the industry from this present demoralization should be more rapid, once a permanent peacetime readjustment has been accomplished. Condensaries in Inter-State Milk Producers' Association territory have made temporary arrangements with their shippers during September, October and November more or less in line with such prices elsewhere. We hope and expect thru the recent general adjustment to correct this most unsatisfactory condition. Even had we desired, we could not have held, for any length of time, the dual price level in our territory, for the Philadelphia fluid market was seriously affected by the relatively lower prices at which manufacturers bought their supplies, particularly the fats. Much of this supply was beginning to come in from points outside our own territorial boundaries.

Feed Prices have not been reduced to the farmer thruout our territory as rapidly as to keep pace with the decreasing price of the dairymen's product. This has been largely because (1) local dealers and some farmers stocked feed last summer at peak prices, fearing both poor transportation facilities and higher transportation costs this winter, (2) because manufacturers and mixers have been very reluctant to liquidate at the lower replacement values (tho perhaps they can remember that as prices advanced they insisted on being allowed to always work this rule the other way). There are at least two things we can do to help this situation and they will prove effective (1) feed our home grown grains as far as possible in making up a well balanced ration. Corn at \$1 per bushel is only \$33 per ton at the most for corn and cob meal. Oats at 60c per bushel means \$41.50 per ton ground. Even ground wheat at present country prices is cheaper than some dealers have charged for bran this fall (2) By co-operative buying in carload lots. Local dealers will usually bid on such business much

lower than when the feed is handled by the sack and sold thru the warehouse on long time credits. When they fail to bid or will not meet quotations, our office will always co-operate to put you in touch with brokers or millers. One neighborhood recently had the advantage of a \$12 cut in the price of cottonseed meal at a local warehouse, when our members threatened to buy a carload themselves at a lower price and this self same local saved \$10 per ton by buying a carload of linseed meal direct thru co-operation with this office.

Lower Production Costs

These are the days when it pays to keep accurate records of production costs. We have cow-testing associations in almost every county thru which you can co-operatively hire an accountant to keep an account with your cows. Our "slacker" cows must go and go now if we are to compete with our dairy products in the world's markets. Comparison of prices for milk and for other farm products:

	Dec. 1919	1920	Reduction, %
Corn	\$1.70	\$1.00	41.93
Potatoes, cwt.	2.75	1.75	37
Wheat	2.36	1.85	21.43
Oats	.88	.60	42
Cattle	16.50	12.00	28
Hogs	14.75	11.00	25

The average reduction of all these in price is 32.56 per cent. In the same time the farmers' milk price has been lowered but 11 per cent.

The following are the comparative November prices of 4 per cent milk f. o. b. Philadelphia for the past five years:

	1916	1917	1918	1919	1920
5c	7c	10c	9c	10c	

Labor

It is true, labor costs on our farms continue as high as at any time during the year, and at the same time the supply has been inadequate. On the other hand there is much unemployment in our cities and employers here in Philadelphia are re-employing a better grade of labor at much lower rates. Surely this movement will react to our farmers advantage by another year. Enough able-bodied men must have felt the pangs of hunger by that time to be willing to return to their former places and help produce that which they could eat, relieving our woman and old men and boys, who have, thru these reconstruction days, even to the present time, continued to furnish the bulk of our farm labor within the influence of our great industrial area here in Pennsylvania.

National Activities

During the year just closed, the officers of the Association have taken an active part in promoting the interests of its members in a national way. I have twice represented the Association at the annual meetings of the National Milk Producers' Federation, first in 1919 at the December meeting and then the past October when the date was changed to coincide with the time of the National Dairy Show. During this time I have served as treasurer of that organization. We have taken an active interest in, and rendered, I trust, substantial assistance to the milk producers of New Orleans who have had the misfortune to be the first milk organization prosecuted under the so-called Sherman act, an experience which might just as readily have come to us.

How many cows in your dairy are in A-1 health?

PREVENTION of disease is the first chapter in the gospel of profitable dairying.

Not every cow in your dairy can make a conspicuous production record, but not one of them should be allowed to limp along as "poor milkers" when their yearly yield could be decidedly raised by keeping the organs of production in a top-notch health condition.

This health program does not mean an expensive veterinary service; in most cases an adequate home treatment is simple and easy. The most prevalent cow diseases, such as Retained

Afterbirth, Abortion, Barrenness, Scouring, Bunches and Milk Fever, are directly due to a weakening of the digestive or genital organs. Proper treatment will make them function normally.

KOW-KARE is distinctly a cow medicine; it acts directly on these organs, with prompt and noticeable results. The KOW-KARE treatment is so simple and inexpensive, no wonder it is so widely used.

Feed dealers, general stores and druggists sell KOW-KARE; 70c and \$1.40 packages. Let us send you our free book, "The Home Cow Doctor"

Her Milk Record Is 13,227 Pounds

LAST YEAR this splendid 5-year-old GUERNSEY, besides this notable mark in milk production, had a butterfat total of 653.4 lbs.

Such profitable producers are only found in the dairies where cow health is carefully guarded.

NOTE: The trade-mark name has been changed from KOW-KURE to KOW-KARE—a name more expressive of both the PREVENTIVE and CURATIVE qualities of the remedy. There is not the slightest change in formula or manufacture.

DAIRY ASSOCIATION CO., Lyndonville, Vt.
Manufacturers of KOW-KARE and BAG BALM

Peerless Feed Mill

Double crusher roll, machine-cut plates. Grinds better quality feed with less power, grinds green ear corn, small grains and alfalfa. Also furnished with cast plates. Sizes 1 1/2 to 20 H. P. Write for prices and catalog.

W. D. POWER & CO., 601 W. 33 St., New York City. We are the largest handlers of commission hay in greater New York; if you have hay to dispose of, communicate with them.

Peerless Fodder Shredder

If you have 3 H. P. engine you can run this 14-inch machine successfully. Will pay for itself in one year's use. Will not pulverize blades and tops. Sold on thirty days free trial. Write for price and catalog.

A. M. DELLINGER, Lancaster, Pa.

Fencing

We manufacture a ready-made Cedar Picket and Galvanized Wire Fence, interwoven, painted or plain, 3 or 4 ft. heights. 100 ft. to Roll. Will not rust, sag or break when properly put up. Can make prompt shipment. Write for prices. **NEW JERSEY FENCE CO., Burlington, N. J.**

HAY

TOP-DRESSING TALK No. 2

From Bag to Fertilizer Distributor

Think what it means to have a top-dressing fertilizer which is ready for use without pounding of hard lumps and without laborious screening—one that is fine and dry and which gives every plant a uniform feeding.

Then think of having a fertilizer which contains one-third more ammonia (one-third more active plant food) than any other nitrogenous top-dressing.

Also think of a fertilizer which doesn't wash out of the soil—one which is ever ready to feed but which will last the season through.

To all these advantages add low price per pound of actual plant food and you have in mind *The Great American Ammoniate*.

ARCADIAN

Sulphate of Ammonia

The efficient top-dressing fertilizer for Orchards, Vegetables and general farm crops—all crops needing ammonia.

Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past.

Arcadian is the kiln-dried and screened grade, made fine and dry for top dressing purposes. Ammonia 25 1/2% guaranteed. Made in U. S. A.

HORTICULTURE

PROPAGATING TREES AT HOME

The work of propagating trees and plants is not difficult. Formerly this work was considered among the black arts and the successful nurseryman in the old days was often considered endowed with witchery. For the home orchard on the average farm only a small tract of land is needed. This should be good garden soil, well drained and well fertilized. The few seeds needed for the home nursery may be obtained without difficulty. Peach, cherry and plum pits may be saved from the preserving kettle and apple and pear seeds from cider pomace or other sources. In many cases they may be purchased. The first process is to "stratify" the seeds—that is, place them in moist sand and expose them to the effects of freezing weather. This is done in the late fall or early winter. In the spring the seeds are sown in rows wide enough to allow cultivation. Root-grafting is practiced with many shrubs and propagated by cuttings. These are usually taken in

til set in their permanent places.

Budding is the method employed with peaches and in fact all our tree fruits. It is more simple than root grafting and done in the summer season. The seedlings are left in the nursery rows until near the end of the main growing season, say along in September. A cut in the form of a T, is made in the bark near the base of the seedling. Buds are cut from vigorous twigs on trees of the varieties desired. These buds are cut in the form of a shield which are then inserted in the T prepared, one for each cut. Raffia, grass or thin strips of cloth are bound tightly above and below to hold the bud in place. This can be removed in a few days. The seedling is allowed to grow on until the following spring, when the twig is cut off just above the bud. All other buds are cut off the late fall or early winter. In the so the entire growth of the tree is spring the seeds are sown in rows forced into the one bud.

Grapes, currants and many flower- ing shrubs are propagated by cut- ings. These are usually taken in

Farmers In the Making

allowed to grow thruout the season late fall or winter and should be and dug up at the approach of cold weather. They should be stored in moist sand or better, sawdust from green logs, in a cool cellar or basement. Clons of the current year's growth should be cut at the same time and stored in the same manner. Along in January the graft-union is made. This is done by making a smooth cut at the base end of the cion about an inch long, then near the end a cut is made in the reverse direction so that a thin tongue one-half inch long is made upon the face of the slope. The stock, which is what the seedling is called is prepared in the same way and the two fitted together so that the tongues interlock. Care should be taken that the bark line of stock and cion come together exactly on at least one edge. The union is bound with weak cotton string and placed in storage until planting time. Note that the cuts must be made on the lower or larger end of the cion and upon the upper end of the stock. The root is usually left three or four inches long and the cion may be six or seven. When the graft is placed in the ground, one bud only should be left above the surface. Grafts are set close together in the nursery rows and should be carefully cultivated un-

BEST TOMATOES FOR CANNERY

Out of nine varieties of tomatoes commonly grown for the cannery, Greater Baltimore had the best record in Cumberland County, New Jersey, in a series of tests on five farms. The second best yielding variety was Bonnie Best, including a strain of Bonnie Best seed selected by the cannery factory. Third in yield, was Matchless.

These tests only support the opinion of many growers. The ripening and picking dates show that 45 per cent of the total production of Bonnie Best ripened before September 7, while 34 per cent of the Greater Baltimore ripened before that date, and 26 per cent of the Matchless. Sixty per cent of Bonnie Best ripened during September, 64 per cent of Greater Baltimore, and 57 per cent of Matchless. This shows that Matchless is

January 1, 1921.

good for late planting; 61 per cent of the crop was ripe after September 15.

The average of yields on the five farms was as follows:

Variety.	Av. tons per acre
Greater Baltimore	5.54
Bonnie Best	5.06
Campbell's Bonnie Best	5.41
Matchless	5.05
Simon's Columbia	4.76
Steven's Mixed	4.68
Cumberland Red	4.51
Red Rock	3.78
Stone	4.42

—E. A. Kirkpatrick.

NEW JERSEY APPLE SHOW

New Jersey grows apples under so many varying conditions of soil that at the great fruit show which will be a feature of "Farmers' Week" at Trenton, Jan. 10 to 15, growers will be permitted to compete by geographical districts as well as in the state-wide sweepstakes. The record apple crop of the past season and the range and value of the prizes promise to make the exhibit the finest ever staged by the garden state orchardists.

The fruit show will be held at the Second Regiment Armory in connection with the annual meeting of the State Board of Agriculture and other farm organizations. The State Horticultural Experiment Station will co-operate in putting on the exhibits and all entries must be filed with A. Freeman Mason, of New Brunswick, before January 1.

CHECK DAMAGE BY MICE TO FRUIT TREES

The heavy damage which meadow mice do every winter to young fruit trees may be prevented in a large measure if the farmer or orchardist will go systematically about ridding his orchards of the rodents.

The best preventive is the placing of poisoned bait before the ground is covered with snow. This bait, consisting of poisoned wheat or oatmeal, will kill the mice, but great care needs to be used in placing it, or it will kill valuable birds and poultry.

The best way of distributing the poison is to place a handful of the poisoned grain inside of a tin can, the cut lid of which is partly closed; then put under a board or brush pile in the field or orchard.

The mice ordinarily take shelter in such places and will find the bait even quicker than if it is thrown broadcast. It will likewise be protected from the weather, will retain its strength longer, and will be safe from birds and poultry.

NOTICE TO GRAPE GROWERS

The National Grape Growers' Association will hold its second annual convention at Cleveland, Ohio, January 11, 1921. Headquarters, the Hollenden Hotel.

For further particulars and reservation, communicate with Secretary W. H. Asbury, Unionville, Lake Co., Ohio.

Every bonafide grower of grapes is invited to attend as issues of great importance to the industry must be met.—O. W. Johnson, President.

The thunder of business often sours the milk of human kindness.

A little over half a century ago it took 75 per cent of our population to grow food. Today 25 per cent can do it. Such is efficiency.

Building Stamina Into Case Tractors

IN CASE shops, under the terrific impact of a constant stream of accelerated blows of huge steam hammers, white hot, high carbon steel is accurately formed into forged driving gears, front axles, crank shafts, cam shafts, connecting rods and numerous other important parts of Case tractors.

The many high-grade, steel forgings, heat treated and carbonized put strength and durability into Case tractors without unnecessary weight.

These items are only a few indications of the high quality features that make Case tractors superior.

Each part that goes into the construction of Case tractors is made and put in place with the same conscientious, efficient thoroughness that marks the manufacture of every forged part.

Extra strength is built into Case tractors to protect Case users against delay and loss frequently experienced with tractors not made to the Case standard.

Polly, Put the Kettle On

Hot Water as a Remedy

As a simple household remedy I know of nothing so quickly and easily obtained, and so efficacious in results, as hot water. At least three times in the past 20 years I have heard physicians express appreciation of the help rendered them in treating emergency cases by farm women by whom it had been applied while awaiting the advent of the doctor.

On one occasion I was awakened at midnight to find a member of the family suffering agonizing abdominal pain, which was the more alarming to us from the fact that he was rarely ill and never made any fuss over an ailment. We realized at once that there was some acute intestinal trouble, and that serious, if not fatal, results would ensue unless relief was speedily given. So while a neighbor hastened for a doctor (telephones were then unknown in rural communities), we administered the usual household remedies, all of which were instantly rejected by the stomach, thus increasing our alarm. Fortunately I recalled treatment I had once seen given under physicians' orders to a woman threatened with typhoid fever, in which case severe intestinal pain had succumbed to hot applications, thick towels being wrung out of hot water to which had been added a few drops of turpentine, and applied to the region of pain, the treatment being continued for a half hour, and then hot water, with the turpentine omitted, being substituted for another half-hour, and "stools" applied at longer intervals. As family custom older than the writer had decreed that water must be put to heat at once in time of such alarm, the kettle was boiling by the time soda, peppermint, etc., had proved futile. These external applications were resorted to with great relief to the sufferer till the arrival of the doctor two hours later. And the first thing that the doctor ordered was hot applications. On learning that his order had been anticipated, and the nature of the application, he complimented us on "knowing how to use our heads."

Later a member of the family had a croupy child. The first attack, shortly after midnight, found the young parents with no knowledge of mode of procedure and loathe to call a neighbor. Fortunately, the doctor was but a few houses distant and was soon at hand. On calling for hot water he expressed surprise that it was instantly forthcoming, and was told that the young mother always left a large kettle of water on the all-night coal fire in the living-room. My mother during my absence slipped and fell down several steps and injured her knee. I found it badly swollen. While waiting for the doctor, who was obtained after a wait of several hours, we applied hot compresses. On his arrival the doctor said he could not determine the nature of the injury till the swelling subsided and that we were doing all that could be done to bring about such a result. On a later call he

found a dislocation of the kneecap. (Editor's Note.—The X-ray photos nowadays determine at once any fracture or dislocations; also abscesses and tubercular lesions).

The use of hot water bottles allows hot application with less annoyance and discomfort to patient than the old-time compress or "stools," and when possible to obtain results as effluently and the like ailments the frantically I use it. In pneumonia, flu, is necessary to furnish dry heat.

I have found the hot-water bottle placed in the bed near the feet of the sufferer excellent in cases of insomnia of an aged person, and have seen good results from its use at the feet of an epileptic whose falling attacks were followed by sleepless nights.

In cases of infantile convulsions,

Doily Dish Mats With Tape or Ribbon

however, the bottle application is out of the question, and the hot bath or hot pack must be resorted to. As this is one of the most common and at the same time most terrifying conditions that arises to demand prompt home treatment, I will close by giving an instance in which I had my first and, I am glad to say, only opportunity to witness treatment and results.

The mother was a nervous creature who could do nothing but wring her hands and cry when her two-year-old boy was thrown into convulsions by being fed on banana. The older children ran for Mrs. C. and myself. The former caught up a large dishpan (foot tub lacking), filled it with hot water which was fortunately on the stove, and had the baby in a hot bath in a jiffy. My part in what looked to me to threaten a tragedy was to telephone for the doctor—always hard to locate at 10 A. M. when out on wide country practice, and I found my job no sinecure. Finally we caught him and he got on the case just as the child, having suffered several relapses, had settled into unconsciousness. He disdained the dishpan, and ordered

the wash boiler to be half filled with hot water, and blankets brought. Then the big kitchen table was cleared and for three hours Mrs. C. and I nearly boiled our hands in wringing out steaming blankets while the doctor, coat discarded and sleeves rolled up, kept the unconscious baby in a hot pack on that table. At the end of that time the baby passed into natural sleep.

I have since learned that bananas are likely to affect young children thus.

While to be "kept in hot water" sounds prejudicial to domestic peace and happiness, its practical application may save much trouble and even life.—Mrs. Julia McS. Miller, Baltimore Co., Md.

DON'T CHANGE YOUR SPOTS

In our town there is a young girl who was noted for her friendliness and pep. She married a conservative, dignified bachelor who was the only son of a properly assorted family consisting of the father, mother, grandmother and two maiden aunts. All of the family were of the aloof, I-am-not-of-your-sphere type, as dignified, proper and precise as you could imagine.

The little bride was the exact antithesis of her newly acquired in-laws. Everybody supposed, in a few years, Jane would be a perfect rep-

resentation of the type who makes many friends, but had she submerged her personality with that of her newly acquired relations I fear her new personality would have lost many friends.

So, let us be like the leopard, and not try to change our spots! Let's get away from being "copy cats." One of the greatest charms anyone can possess is just being natural—absolutely, wholly and completely—yourself!—Helen Gregg Green.

HOG-KILLING TIME RECIPES

Hog-killing time means that the farmer must consider ways of preserving pork, not only to keep it in good condition but to make it tasty as well. The methods following have been gathered by the Department of Home Economics at the University of Wisconsin.

Dry Curing

For every 100 lbs. of pork a mixture should be made consisting of 2 lbs. New Orleans sugar; 8 to 10 lbs. salt; 2 oz. saltpeter; 2 oz. pepper and 2 oz. red pepper, or 4 oz. black pepper.

The thoroly cooled hams, bacon and shoulders should be rubbed with one-half the dry mixture, left in a cool dry place for two weeks, and then rubbed with the remainder of the sugar and salt mixture. The meat should then be allowed to stay in a cool dry place for six weeks. Care must be taken to force the sugar and salt mixture into the hock ends of the bones and into the joints. At the end of the second period the meat should be smoked.

Pork Sausage Making

To every 3 lbs. fresh pork allow 1 lb. fat. Grind the meat and the fat thru a meat chopper. Weigh the meat, spread it out in a thin layer, and season with the following mixture, allowing to every 10 lbs. meat 2½ oz. fine salt, 1½ oz. black pepper and 1½ oz. ground sage (or leaf sage ground fine).

The seasoning should be sprinkled over the meat, and the two mixed together and run thru a meat chopper a second time.

Bulk sausage may be packed in a stone or glass jar, and the air kept out by a thin coating of melted lard poured over the top.

Head Cheese

Boil 25 lbs. pork taken from the head, heart and tongue and trimmings. When the meat separates from the bones, cool the mixture and separate the bones from the meat. Cut the meat into ½ or 1-inch cubes and add this seasoning: ½ lb. pepper, ½ lb. salt, ½ oz. allspice, ½ oz. cloves, ½ oz. caraway, 2 qts. broth in which the meat was boiled.

Mix thoroly together. The cheese may be put into a clean hog paunch, or it may be put into a two-inch pan to cool.

Philadelphia Scrapple

Meat cooked as for head cheese is used. To 25 lbs. meat use ½ lb. pepper and ½ lb. salt. The bones are removed and the meat turned into the liquor in which it was cooked. It is then heated to the boiling point and corn meal added slowly with constant stirring until the mixture is as thick as cornmeal mush. It should be stirred and boiled for 15 minutes to distribute the fibers of meat thruout the mass, and then cook it very slowly an additional hour. Pour it into shallow pans 2 inches in depth, cool and keep in a cool place. It is sliced

thin and fried as needed.

Soup Meats for Canning.

Place 25 lbs. ribs, joints, marrow bones cracked in a thin cloth sack in a large kettle holding 5 gallons cold water. Simmer, do not boil, for at least six hours. Skim off the fat. Remove the sack of bones and add boiling water to make 5 gallons. Pack in sterile hot glass jars, partially seal and sterilize for 1½ hours. Seal thoroly and keep in a cool place.

COOKING HINTS

For the very best coffee reheat the beans in the oven, adding a little butter and stirring often until well heated thru. Prepare only enough for one meal and grind when just ready to use.

Any left-over bits of canned or preserved fruit, jam or jelly can be used in pudding sauce, giving it an unusual flavor. Or it may be used in any kind of blanc mange, gelatin or tapioca desserts, giving them not only a fine appearance but an improved flavor.

When a gelatin dessert is wanted quickly, dissolve the gelatin in only half the usual amount of hot water, using for the remainder cold water. It cools in half the time and is just as good.

When whipping cream, add enough honey to sweeten it, and whip as usual. It whips more easily, retains its stiffness better and has a delicate flavor very unlike that when sugar is used.

When putting the vegetables for soup thru the food chopper, add two slices of stale bread to soup enough for six people. When ground with the vegetables it absorbs their juices so none is lost, and it thickens the soup slightly.

When one has reason to think that yeast cakes are too old to have proper raising power, they can be tested in this way: Place one in a cup two-thirds full of water and add a dessertspoon of sugar. If good it will soon rise to the top of the water surrounded by a mass of bubbles, which shows it is working. If it does not do this, the yeast is too old to use.

Save the rich syrup after the pickled pears and peaches have been used. Baste the roast with a little of it and see what a delicious flavor it imparts to the meat. If the syrup is quite sweet, use it instead of molasses in cake or gingerbread, and the rest of it can be used in mince pies.

If left-over cereal has cold water poured over it before being set away it will never have a hard skin form on top. The water can be easily drained off before the cereal is used again.—Mrs. H. M. Woodward.

PENNSYLVANIA FARMER PATTERNS
Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address: Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

1974.—Child's Outdoor Set.—Consisting of Leggings and Coat. The leggings extend to the waistline. The pattern is cut in 4 sizes: 2, 3, 4 and 5 years. It requires 3½ yards of 44-inch material for a 4-year size. Pattern, 10 cents.

3051.—Coat for 6 to 14 Years.—This is a good spring model for cheviot and tweed mixtures. The fronts may be turned back in low outline, or closed to the neck edge, with the collar rolled high. The pattern is cut in 5 sizes: 6, 8, 10, 12 and 14 years. Size 12 will require 4½ yards of 44-inch material. Pattern, 10 cents.

3102.—Coat for Wee Maids.—The pattern is cut in 4 sizes: 4, 6, 8 and 10 years. Developed in brown wool velours with facings of velvet in a matched shade, this makes a natty top coat for little girls. The body and sleeve are cut in one. A six-year size will require 8½ yards of 44-inch material. Pattern, 10 cents.

1859.—Attractive Cap Styles.—The college girl and the school girl both find this style of head covering attractive, and the fashions here shown are so easy to develop that even the little school girl who knows how to ply her needle can make for herself a smart cap for school. Poplin, faille, taffeta are nice for spring caps. Pattern comes cut in 3 sizes: 3 to 8 years (children's), 10 to 14 years (girls'), and 16 to 20 years (ladies'). Girls' size requires ¾ yard of 27-inch material for Cap No. 1 and 1 yard for No. 2 with ¾ yard of canvas and ½ yard of buckram for interlining. Pattern, 10 cents.

3095.—Cape and Muff Set.—These will feel good many a raw day in March and April. The pattern comprises a muff cut in one size, and a cape cut in 3 sizes: Small, 32-34; medium, 36-38; and Large, 40-42 inches bust measure. Fur, plush, velvet, corduroy, satin silk and broadcloth are good materials for the cape and the muff. Fur and velvet, or satin may be combined. The collar is convertible. It may be rolled high or low. To make the cape in a medium size will require 2½ yards of 44-inch material. The muff requires ½ yard of 30-inch material for the outside and 1½ yard for all inside sections and stays. Pattern, 10 cents.

1141.—Carriage Robe and Moccasins for Baby.—The robe is so cut and made as to afford complete covering for the little one. This model, made of blanket cloth in a pretty nursery design or of white elderdown lined with soft batiste or silk, would prove very satisfactory and warm. The pattern is in one size only. It requires 1 yard of 30-inch material for one pair of moccasins, and 2½ yards of 36-inch material for the robe. Pattern, 10 cents.

WEAVER PIANOS

"In my old Kentucky home far away—"

JOY, sorrow, hope, fear—the whole scale of human emotions seems to be bound up in the Weaver Piano. Whether it be the grand theme of one of the world's greatest composers, or the plaintive melody of the simple folk song, it finds ready expression in the Weaver's full, clear, responsive tone and exquisite harmony.

It is this limpid, pure tone-quality that makes the Weaver so much desired by professional musicians and music lovers. It is this same quality of tone that has endeared it to thousands of American homes.

For over half a century the Weaver master artisans have been building fine instruments. They have done their work so well that today the name Weaver on a piano means perfection, as near as highly skilled human hands can make it.

To own a Weaver is to take keen satisfaction in it as a work of art. To play a Weaver is to find expression for your every mood.

What Makes Your Garden Grow?

Good, productive, well fertilized soil, free from weeds, is one thing to produce big crops. But pure, tested, sterling quality seeds, adapted to the location, are first in importance to make your garden grow and yield the biggest cash returns.

Hardy, Big Yielding, Northern Grown

Isbell's Seeds
As They Grow Their Fame Grows
For Field For Garden

Have proved themselves the best by test. Earliness and hardiness are bred into Isbell seeds through years of scientific culture. They produce big, thoroughbred crops the same as thoroughbred cattle produce thoroughbred offspring. They inherit a rugged, big yielding quality that makes them grow even in spite of hardships. It takes experience to produce such seeds and Isbell has had 42 years of it. We grow our own.

REPORTS OF GRANGES

(Continued From Page 2.)

It is ridiculous for a State to license the selling of a thing that the Federal Constitution and its enabling act forbids. We must again insist with greater vehemence than ever that personal and corporate property shall pay its share of the expense of government and the appropriations for the public need.

We must insist on the right of experimentation in a system of schools that will be suitable to country conditions. Our little folks should go to school in the summer time and stay home in the winter time. Our teachers should be employed for at least eleven months, so that they will have a real occupation like other people. We can close half our schools in the fall, and use the extra teachers to teach agriculture, domestic science, music and manual training—all of which are essential to proper education for the conditions we now live under. The Legislative Committee will again more fully outline the policy we adopted for discussion at our last state meeting.

The Grange Mutual Casualty Company will show the best year it has ever had. We wish again to emphasize the danger of carelessness in this matter on the part of our mem-

tionized their business in the same way. The milk organizations were nearly all in this part of the country started in the Grange, though the organization itself was made outside. This is as it should be, but the Grange should not stop with milk. We should encourage in the same way the organization of a selling potato organization and a fruit selling organization. These organizations have no reference to communities, but are distinctly commodity organizations, but the Grange has the machinery to establish the units needed and to furnish the meeting places when meetings are necessary. We have a Potato Association in this state, and if it would undertake the founding of a state-wide selling agency, I feel sure the Grange would give it royal support in the project. We have a Horticultural Society, and possibly that would be the most fitting nucleus for the establishment of a fruit-selling association that would prevent the loss of the crop in many cases as was the case this year. (Continued Next Week.)

VIEWS ON TAXATION

Editor of The Pennsylvania Farmer: According to your news columns, the National Grange has given forth

Paul and Verna Clouser, Prize Winners at Allentown, Pa. Fair

bers. The time will come when every some views on the subject of taxation. It recommends what is practically a continuance of our present that only those communities are real-ly awake to the situation in which who improve, who save, or who increase the sum total of wealth, or, who are fortunate enough to have wealth thrust upon them. After uttering many paragraphs of absurdities along these lines, it concludes with the only two paragraphs that are based on reason or common sense.

These two paragraphs declare that "All taxes should be levied to encourage home owning and to discourage speculation and tenancy, so far as public policy will permit." The Grange opposes a general sales tax.

Commodity Organization

Why did the members of the Grange, after advocating taxation of all the elements and interests necessary to the encouragement of home owning, and, the continuance of taxes far more unfair and immoral than the sale tax, then ask for taxes that would encourage home owning? I can only find one explanation for such an inconsistent, contradictory and absurd course. I "have a hunch" that the leading spirits of the Grange are wily politicians, that they know the masses of Grange members have little or no economic knowledge, and they (the leaders) who favor the present system of robbing industry and rewarding idleness, see safety in so muddling the situation, that the masses will become disgusted and drop the subject.—Oliver McKnight.

The Voice of the Pack

by Edison Marshall

CHAPTER V.

DAN could see only Snowbird's outline at first, just her shadow against the moonlit hillside. His glasses were none to good at long range. And possibly, when she came within range, the first thing that he noticed about her was her stride. The girls he knew didn't walk in quite that free, strong way. She took almost a man-size step; and yet it was curious that she did not seem ungrateful. Dan had a distinct impression that she was floating down to him on the moonlight. She seemed to come with such unutterable smoothness. And then he heard her call lightly thru the darkness.

The sound gave him a distinct sense of surprise. Some way, he had not associated a voice like this with a mountain girl; he had supposed that there would be so many harshening influences in this place. Yet the tone was as clear and full as a trained singer's. It was not a high voice; and yet it seemed simply brimming, as a cup brims with wine, with the rapture of life. It was a self-confident voice too, wholly unaffected and sincere, and wholly without embarrassment.

Then she came close, and Dan saw the moonlight on her face. And so it came about, whether in dreams or wakefulness, he could see nothing else for many hours to come.

Beauty, after all, is wholly a matter of the nearest possible approach to the physical perfection that many centuries of human faces have established as a standard. This perfection in this case does not mean some ideal that has been imaged by a poet, but just the nearest approach to the perfect physical body that nature intended, and which is the flawless example of the type that composes the race. Thus a typical feature is the most beautiful and by this reasoning a composite picture of all the young girl faces in the Anglo-Saxon nations would be the most beautiful face that any painter could conceive. It follows that health is above all the most essential quality to beauty, because disease, from the nature of things, means thwarted growth that could not possibly reach the typical of the race.

The girl who stood in the moonlight had health. She was simply vibrant with health. It brought a light to her eyes, and a color to her cheeks, and life and shimmer to her moonlit hair. It brought curves to her body, and strength and firmness to her limbs, and the grace of a deer to her carriage. Whether she had regular features or not Dan would have been unable to state. He didn't even notice. They weren't important when health was present. Yet there was nothing of the coarse or bold or voluptuous about her. She was just a slender girl, perhaps twenty years of age, and weighing even less than the figure occasionally to be read in the health magazines for girls

of her height. And she was fresh and cool beyond all words to tell.

And Dan had no delusions above her attitude toward him. For a long instant she turned her keen, young eyes to his white, thin face; and at once it became abundantly evident that beyond a few girlish speculations she felt no interest in him. After a single moment of rather strained, polite conversation with Dan—just enough to satisfy her idea of the conventions—she began a thrilling tale to her father. And she was still telling it when they reached the house.

Dan held a chair for her in front of the fireplace, and she took it with entire naturalness. He was careful to put it where the firelight was at its height. He wanted to see its effect on the flushed cheeks, the soft dark hair. And then, standing in the shadows, he simply watched her. With the eye of an artist he delighted in her gestures, her rippling enthusiasm, her utter, irrepressible girlishness that all of time had not years enough to kill.

He decided that she had gray eyes. Gray eyes seemed to be characteristic of the mountain people. Sometimes, when the shadows fell across them, they looked very dark, as if the pines had been reflected in them all day and the image had not yet faded out. But in an instant the shadow flicked away and left only light—light that went into him and did all manner of things to his spirit.

Bill stood watching her, his hands deep in his pockets, evidently a companion of the best. Her father gazed at her with amused tolerance. And Dan—he didn't know in just what way he did look at her. And he didn't have time to decide. In less than fifteen minutes, and wholly without warning she sprang up from her chair and started toward the door.

"Good Lord!" Dan breathed. "If you make such sudden motions as that I'll have heart failure. Where are you going now?"

"Back to my watch," she answered, her tone wholly lacking the personal note which men have learned to expect in the voices of women. And an instant later the three of them saw her retreating shadow as she vanished among the pines.

Dan had to be helped to bed. The long ride had been too hard on his shattered lungs; and nerves and body collapsed an instant after the door was closed behind the departing girl. He laughed weakly and begged her pardon; and the two men were really very gentle. They told him it was their own fault for permitting him to overdo. Lennox himself blew out the candle in the big, cold bedroom.

Dan saw the door close behind him, and he had an instant's glimpse of the long sweep of the moonlit ridge that stretched beneath the window. Then, all at once, seemingly without warning, it simply blinked out. Not until the next morning did he really know why. Insomnia was an old acquaintance of Dan's, and he had expected to have some trouble in getting to sleep. His only real trouble was

waking up again when Lennox called him to breakfast. He couldn't believe that the light at his window shade was really that of morning.

"Good Heavens!" his host exploded. "You sleep the sleep of the just." Dan was about to tell him that on the contrary he was a very nervous sleeper, but he thought better of it. Something had surely happened to his insomnia. The next instant he even forgot to wonder about it in the realization that his tired body had been wonderfully refreshed. He had no dread now of the long tramp up the ridge that his host had planned.

But first came target practice. In Dan's baggage he had a certain very plain but serviceable sporting rifle of about thirty-four caliber—a gun that the information department of the large sporting-goods store in Gettysburg had recommended for his purpose. Except for the few moments in the store, Dan had never held a rifle in his hands.

Of course the actual aiming of a rifle is an extremely simple proposition. A man with fair use of his hands and eyes can pick it up in less time than it takes to tell it. The fine art of marksmanship consists partly in the finer sighting—the instinctive realization of just what fraction of the front sight should be visible thru the rear. But most of all it depends on the control that the nerves have over the muscles. Some men are born rifle shots; and on others it is quite impossible to thrust any skill whatever.

The nerve impulses and the muscular reflexes must be exquisitely tuned, so that the finger presses back on the trigger the identical instant that the mark is seen on the line of the sights. One quarter of a second's delay will usually disturb the aim. There must be no muscular jerk as the trigger is pressed. Shooting was never a sport for blasted nerves. And usually such attributes as the ability to judge distances, the speed and direction of a fleeing object, and the velocity of the wind can only be learned by tireless practice.

When Dan first took the rifle in his hands, Lennox was rather amazed at the ease and naturalness with which he held it. It seemed to come naturally to his shoulder. Lennox scarcely had to tell him how to rest the butt and to drop his chin as he aimed. He began to look rather puzzled. Dan seemed to know all these things by instinct. The first shot, Dan hit the trunk of a five-foot pine at thirty paces.

"But I couldn't very well have missed it!" he replied to Lennox's cheer. "You see, I aimed at the middle—but I just grazed the edge."

The second shot was not so good, missing the tree altogether. And it was a singular thing that he aimed longer and tried harder on this shot than on the first. The third time he tried still harder, and made by far the worst shot of all.

"What's the matter?" he demanded. "I'm getting worse all the time."

Lennox didn't know for sure. But he made a long guess. "It might be beginner's luck," he said, "but I'm inclined to think you're trying too hard. Take it easier—depend more on your instincts. Some marksmen are born good shots and cook themselves trying to follow rules. It might be, by the longest chance, that you're one of them—at least it won't hurt to try."

Dan's reply was to lift the rifle lightly to his shoulder, glance quickly along the trigger, and fire. The bullet struck within one inch of the pine.

For a long time Lennox gazed at him in open-mouthed astonishment. "My stars, boy!" he cried at last. "Was I mistaken in thinking you were a born tenderfoot—after all? Can it be that a little of your old grandfather's skill has been passed down to you? But you can't do it again."

But Dan did do it again. If anything, the bullet was a little nearer the center. And then he aimed at a more distant tree.

But the hammer snapped down effectively on the breech. He turned up with a look of question.

"Your gun only holds five shots," Lennox explained. Reloading, Dan tried a more difficult target—a trunk almost one hundred yards distant. Of course it would have been only child's play to an experienced hunter; but to a tenderfoot it was the difficult mark indeed. Twice out of four shots Dan hit the tree trunk, and one of his two hits was practically a bull's eye. His two misses were the result of the same mistake he had made before—attempts to fold his aim too long.

The shots rang far thru the quiet woods, long-drawn from the echoes that came rocking back from the hills. In contrast with the deep silence that is really an eternal part of the mountains the sound seemed preternaturally loud. All over the great sweep of canyon, the wild creatures heard and were startled. One could easily imagine the Columbian deer, gone to their buckbrush to sleep, springing up and lifting pointing ears. There is no more graceful action in the whole animal world than this first, startled spring of a frightened buck. Then old Wolf, feeding in the berry bushes, heard the sound, too. Wolf has considerably more understanding than most of the wild inhabitants of the forest, and maybe that is why he left his banquet and started falling all over his awkward self in descending the hill. It might be that Lennox would want to procure his guest a sample of bear steak; and Wolf didn't care to be around to suggest such a thing. At least, that would be his train of thought according to those naturalists who insist on ascribing human intelligence to all the forest creatures. But it is true that Wolf had learned to recognize a rifle shot, and he feared it worse than anything on earth.

Far away on the ridge top, a pair of wolves sat together with no more evidence of life than two shadows. One of the most effective accomplishments a wolf possesses is its ability to freeze into a motionless thing, so the sharpest eye can scarcely detect him in the thickets. It is an advantage in hunting, and it is an even greater advantage when being hunted. Yet at the same second they sprang up, simply seemed to spin in the dead pine needles, and brought up with sharp noses pointed and ears erect, facing the valley.

A human being likely would have wondered at their action. It is doubtful that human ears could have detected that faint tremor in the air which was all that was left of the rifle report. But of course this is a question that would be extremely difficult to prove; for as a rule the senses of the larger forest creatures, with the great exception of scent, are not as perfectly developed as those of a human being. A wolf can see better than a man in the darkness, but not nearly as far in the daylight. But the wolves knew this sound. Too many times they had seen their pack-fellows die in the snow when such a report as this one, only intensified a thousand times, cracked at them thru

the winter air. No animal in all the forest has been as relentlessly hunted as the wolves, and they have learned their lessons. For longer years than most men would care to attempt to count, men have waged a ceaseless war upon them. And they have learned that their safety lies in flight.

Very quietly, and quite without panic, the wolves turned and headed farther into the forests. Possibly no other animal would have been frightened at such a distance. And it is certainly true that in the deep, winter snows not even the wolves would have heeded the sound. The snows bring famine; and when famine comes to keep its sentry-duty over the land, all the other forest laws are immediately forgotten or ignored. The pack forgets all its knowledge of the deadliness of men in the starving times.

The grouse heard the sound, and, silly creatures that they are, even they raised their heads for a single instant from their food. The felines—the great, tawny mountain lions and their smaller cousins, the lynx all devoted at least an instant of concentrated attention to it. A raccoon, sleeping in a pine, opened its eyes, and a lone bull elk, such as some people think is beyond all other things the monarch of the forest, rubbed his neck against a tree trunk and wondered.

But yet there remained two of the larger forest creatures that did not heed at all. One was Urson, the porcupine, whose stupidity is beyond all measuring. He was too slow and patient and dull to give attention to a rifle bullet. And the other was Graycoat the coyote, gray and strange and foam-lipped, on the hillside. Graycoat could hear nothing but strange whinnings and voices that rang ever in his ears. All other sounds were obscured. The reason was extremely simple. In the dog days a certain malady sometimes comes to the wild creatures, and it is dreaded worse than drought or cold or any of the manifold terrors of their lives. No one knows what name they have for this sickness. Human beings call it hydrophobia. And the coyotes are particularly susceptible to it.

Ordinarily the name of coyote is, among the beasts, a synonym for cowardice as well as a certain kind of detested cunning. All the cowardice of a mountain lion and a wolf and a lynx put together doesn't equal the amount the Graycoat carried in the end of his tail. That doesn't mean timidity. Timidity is a trait of the deer, a gift of nature for self-preservation, and no one holds it against them. In fact, it makes them rather appealing. Cowardice is a lack of moral courage to remain and fight when nature has afforded the necessary weapons to fight with. It is sort of a betrayal of nature—a misuse of powers. No one calls a rabbit a coward because it runs away. A warlike rabbit is something that no man has ever seen since the beginning of the world, and probably never will. Nature hasn't given the little animal any weapons.

But this is not true of the wolf or cougar. A wolf has ninety pounds of lightning-quick muscles, and teeth that are nothing but a set of well-sharpened and perfectly arranged daggers. A cougar not only has fangs but talons that can rend flesh more terribly than the cogs of a machine, and strength to make the air hum under his paw as he strikes it down. And so it is an extremely disappointing thing to see either of

these animals flee in terror from an Alredale not half their size—a sight that most mountain men see rather often. The fact that they act with greater courage in the famine times, and that either of them will fight to the very death when brought to bay, are not extenuating circumstances to their cowardice. A mouse will bite the hand that picks it up if it has no other choice.

A coyote is, at least in a measure equipped for fighting. He is smaller than a wolf, and his fangs are almost as terrible. Yet a herd of determined sheep, turning to face him, puts him in a panic. The smallest dog simply petrifies him with terror. And a rifle report—he has been known to put a large part of a county between himself and the source of the sound in the shortest possible time. If a mountain man feels like fighting, he simply calls another a coyote. It is more effective than impugning the virtue of his female ancestors. To be called a coyote means to be termed the lowest, most despised creature of which the imagination can conceive.

And besides being a perfect, unprincipled coward, he is utterly without pride. And that is saying a great deal. Most large animals have more pride than they have intelligence, particularly the bear and the moose. A mature bear, dying before his foes, will often refrain from howling even in the greatest agony. He is simply too proud. A moose greatly dislikes to appear to run away in the presence of enemies. He will walk with the dignity of a bishop until he thinks the brush has obscured him; and then he will simply fly! And there was a dog once, long ago, which, meeting on the highways a dog that was much larger and that could not possibly be mastered, would simply turn away his eyes and pretend not to see him.

A coyote is wholly without this virtue, as well as most of the other virtues of the animal world—because if one started to condemn all the carion-eating animals of the forest he would soon have precious few of them left—but he also eats old shoes off rubbish pile. Unlike the wolf, he does not even find his courage in the famine times. He has cunning, but cunning is not greatly beloved in men or beasts. Most folk prefer a kindly, blundering awkwardness, a simplicity of heart and spirit, such as are to be found in Wolf the bear.

But Graycoat has one tendency that makes all the other forest creatures regard him with consternation; he is extremely liable to madness. Along in dog days he is seen suddenly to begin to rush thru the thickets, barking and howling and snapping at invisible enemies, with foam dropping from his terrible lips. His eyes grow yellow and strange. And this is the time that even the bull elk turns off his trail. No one cares to meet Graycoat when the hydrophobia is upon him. At such time all his cunning and his terror are quite forgotten in his agony, and he is likely to make an unprovoked charge on Wolf himself.

Now Graycoat came walking stiff-legged thru the thickets. And the forest creatures, from the smallest to the great, forgot the far-off peal of the rifle bullets to get out of his way.

Johnny: 'Course you wouldn't. How would it look—an old lady like you?—Life.

IN SCHOOL-DAYS

Still sits the school-house by the road,
A ragged beggar sunning;
Around it still the sumachs grow,
And blackberry vines are running.

Within, the master's desk is seen,
Deep scarred by raps official;
The warping floor, the battered seats,
The jack-knife's carved initial;

The charcoal frescos on its wall;
Its door's worn sill, betraying

A Story for Children

The Travel of a Penny

By L. M. K.

WHAT a dark smelly pocket this is! I wish I could get out. This man has no right to have me anyway, for he took me out of the collection plate as it was passed to him in church. I was feeling so happy, for a little girl had carried me to church and I had heard her tell her grandmother that I was going to help feed the French orphans. There I was lying on the plate shining and happy. I was shiny because I was new. It was only a few days ago that I was taken from the bank for the first time by a kind man, the father of the little girl who gave me into the collection. However, just when I was so happy, this miserable old tramp picked me off the plate. He must have thought I was gold for he would never have taken just a copper penny intentionally.

How can I get out? I'm here in this place so long. I'm beginning to smell of stale tobacco and the shine is getting dull from rubbing against old buttons, an old pocket knife, some rusty nails and worst of all, an ancient corn-cob pipe. I feel faint from the odor. Why doesn't he spend me for something. Maybe I'm hidden. I shall try and roll another place so that he can feel me when he puts his hand into his pocket.

I wonder where we are going so fast. A policeman must be chasing us, for I hear someone calling "Stop thief!" My owner must have stolen something else. Oh! I hope the policeman catches him, for then maybe I would get out of this horrid place, where I am not doing a speck of good. The pursued person suddenly stops going.

The feet that, creeping slow to school,
Went storming out to playing!

Long years ago a winter sun
Shone over it at setting;
Lit up its western window-panes,
And low eaves' icy fretting.

It touched the tangled golden curls,
And brown eyes full of grieving,
Of one who still her steps delayed
When all the school were leaving.

For near her stood the little boy
Her childish favor singled;
His cap pulled low upon a face
Where pride and shame were mingled.

Pushing with restless feet the snow
To right and left, he lingered;—
As restlessly her tiny hands
The blue-checked apron fingered.

He saw her lift her eyes; he felt
The soft hand's light caressing,
And heard the tremble of her voice,
As if a fault confessing.

"I'm sorry that I spelt the word:
I hate to go above you.
Because,"—the brown eyes lower
told,—
"Because, you see, I love you!"

Still memory to a gray-haired man
That sweet child-face is showing,
Dear girl! the grasses on her grave
Have forty years been growing!

He lives to learn, in life's hard school,
How few who pass above him
Lament their triumph and his loss,
Like her—because they love him.
—Whittier.

The Voice of the Pack

He didn't even notice. They weren't important when health was present. Yet there was nothing of the coarse or bold or voluptuous about her. She was just a slender girl, perhaps twenty years of age, and weighing even less than the figure occasionally to be read in the health magazines for girls

of her height. And she was fresh and cool beyond all words to tell. And Dan had no delusions above her attitude toward him. For a long instant she turned her keen, young eyes to his white, thin face; and at once it became abundantly evident that beyond a few girlish speculations she felt no interest in him. After a single moment of rather strained, polite conversation with Dan—just enough to satisfy her idea of the conventions—she began a thrilling tale to her father. And she was still telling it when they reached the house.

Dan held a chair for her in front of the fireplace, and she took it with entire naturalness. He was careful to put it where the firelight was at its height. He wanted to see its effect on the flushed cheeks, the soft dark hair. And then, standing in the shadows, he simply watched her. With the eye of an artist he delighted in her gestures, her rippling enthusiasm, her utter, irrepressible girlishness that all of Time had not years enough to kill.

He decided that she had gray eyes. Gray eyes seemed to be characteristic of the mountain people. Sometimes, when the shadows fell across them, they looked very dark, as if the pines had been reflected in them all day and the image had not yet faded out. But in an instant the shadow flicked away and left only light—light that went into him and did all manner of things to his spirit.

Bill stood watching her, his hands deep in his pockets, evidently a companion of the best. Her father gazed at her with amused tolerance. And Dan—he didn't know in just what way he did look at her. And he didn't have time to decide. In less than fifteen minutes, and wholly without warning she sprang up from her chair and started toward the door.

"Good Lord!" Dan breathed. "If you make such sudden motions as that I'll have heart failure. Where are you going now?"

"Back to my watch," she answered, her tone wholly lacking the personal note which men have learned to expect in the voices of women. And an instant later the three of them saw her retreating shadow as she vanished among the pines.

Dan had to be helped to bed. The long ride had been too hard on his shattered lungs; and nerves and body collapsed an instant after the door

was closed behind the departing girl. He laughed weakly and begged her pardon; and the two men were really very gentle. They told him it was their own fault for permitting him to overdo. Lennox himself blew out the candle in the big, cold bedroom.

Dan saw the door close behind him, and he had an instant's glimpse of the long sweep of the moonlit ridge that stretched beneath the window. Then, all at once, seemingly without warning, it simply blinked out. Not until the next morning did he really

know why. Insomnia was an old acquaintance of Dan's, and he had expected to have some trouble in getting to sleep. His only real trouble was

waking up again when Lennox called him to breakfast. He couldn't believe that the light at his window shade was really that of morning.

"Good Heavens!" his host exploded. "You sleep the sleep of the just." Dan was about to tell him that on the contrary he was a very nervous sleeper, but he thought better of it. Something had surely happened to his insomnia. The next instant he even forgot to wonder about it in the realization that his tired body had been wonderfully refreshed. He had no dread now of the long tramp up the ridge that his host had planned.

But first came target practice. In Dan's baggage he had a certain very plain but serviceable sporting rifle of about thirty-four caliber—a gun that the information department of the large sporting-goods store in Gitchapolis had recommended for his purpose. Except for the few moments in the store, Dan had never held a rifle in his hands.

Of course the actual aiming of a rifle is an extremely simple proposition. A man with fair use of his hands and eyes can pick it up in less time than it takes to tell it. The fine art of marksmanship consists partly in the finer sighting—the instinctive realization of just what fraction of the front sight should be visible thru the rear. But most of all it depends on the control that the nerves have over the muscles. Some men are born rifle shots; and on others it is quite impossible to thrust any skill whatever.

The nerve impulses and the muscular reflexes must be exquisitely tuned, so that the finger presses back on the trigger the identical instant that the mark is seen on the line of the sights. One quarter of a second's delay will usually disturb the aim. There must be no muscular jerk as the trigger is pressed. Shooting was never a sport for blasted nerves. And usually such attributes as the ability to judge distances, the speed and direction of a fleeing object, and the velocity of the wind can only be learned by tireless practice.

When Dan first took the rifle in his hands, Lennox was rather amazed at the ease and naturalness with which he held it. It seemed to come naturally to his shoulder. Lennox scarcely had to tell him how to rest the butt and to drop his chin as he aimed. He began to look rather puzzled. Dan seemed to know all these things by instinct. The first shot, Dan hit the trunk of a five-foot pine at thirty paces.

"But I couldn't very well have missed it!" he replied to Lennox's cheer. "You see, I aimed at the middle—but I just grazed the edge."

The second shot was not so good, missing the tree altogether. And it was a singular thing that he aimed longer and tried harder on this shot than on the first. The third time he tried still harder, and made by far the worst shot of all.

"What's the matter?" he demanded. "I'm getting worse all the time."

Lennox didn't know for sure. But he made a long guess. "It might be beginner's luck," he said. "But I'm inclined to think you're trying too hard. Take it easier—depend more on your instincts. Some marksmen are born good shots and cook themselves trying to follow rules. It might be, by the longest chance, that you're one of them—at least it won't hurt to try."

Dan's reply was to lift the rifle lightly to his shoulder, glance quickly along the trigger, and fire. The bullet struck within one inch of the

For a long time Lennox gazed at him in open-mouthed astonishment. "My stars, boy!" he cried at last. "Was I mistaken in thinking you were a born tenderfoot—after all? Can it be that a little of your old grandfather's skill has been passed down to you? But you can't do it again."

But Dan did do it again. If anything, the bullet was a little nearer the center. And then he aimed at a more distant tree.

But the hammer snapped down instead, the bullet was a little nearer the center. And then he aimed at a more distant tree.

But the hammer snapped down instead, the bullet was a little nearer the center. And then he aimed at a more distant tree. "Your gun only holds five shots," Lennox explained. Reloading, Dan tried a more difficult target—a trunk almost one hundred yards distant. Of course it would have been only child's play to an experienced hunter; but to a tenderfoot it was the difficult mark indeed. Twice out of four shots Dan hit the tree trunk, and one of his two hits was practically a bull's eye. His two misses were the result of the same mistake he had made before—attempts to hold his aim too long.

The shots rang far thru the quiet woods, long-drawn from the echoes that came rocking back from the hills. In contrast with the deep silence that is really an eternal part of the mountains the sound seemed preternaturally loud. All over the great sweep of canyon, the wild creatures heard and were startled. One could easily imagine the Columbian deer, gone to their buckbrush to sleep, springing up and lifting pointing ears. There is no more graceful action in the whole animal world than this first, startled spring of a frightened buck. Then old Wolf, feeding in the berry bushes, heard the sound, too. Wolf has considerably more understanding than most of the wild inhabitants of the forest, and maybe that is why he left his banquet and started falling all over his awkward self in descending the hill. It might be that Lennox would want to procure his guest a sample of bear steak; and Wolf didn't care to be around to suggest such a thing. At least, that would be his train of thought according to those naturalists who insist on ascribing human intelligence to all the forest creatures. But it is true that Wolf had learned to recognize a rifle shot, and he feared it worse than anything on earth.

Far away on the ridge top, a pair of wolves sat together with no more evidence of life than two shadows. One of the most effective accomplishments a wolf possesses is its ability to freeze into a motionless thing, so the sharpest eye can scarcely detect him in the thickets. It is an advantage in hunting, and it is an even greater advantage when being hunted. Yet at the same second they sprang up, simply seemed to spin in the dead pine needles, and brought up with sharp noses pointed and ears erect, facing the valley.

A human being likely would have wondered at their action. It is doubtful that human ears could have detected that faint tremor in the air which was all that was left of the rifle report. But of course this is a question that would be extremely difficult to prove; for as a rule the senses of the larger forest creatures, with the great exception of scent, are not as perfectly developed as those of a human being. A wolf can see better than a man in the darkness, but not nearly as far in the daylight.

But the wolves knew this sound. Too many times they had seen their pack-fellows die in the snow when such a report as this one, only intensified a thousand times, cracked at them thru

the winter air. No animal in all the forest has been as relentlessly hunted as the wolves, and they have learned their lessons. For longer years than most men would care to attempt to count, men have waged a ceaseless war upon them. And they have learned that their safety lies in flight.

Very quietly, and quite without panic, the wolves turned and headed farther into the forests. Possibly no other animal would have been frightened at such a distance. And it is certainly true that in the deep, winter snows not even the wolves would have heeded the sound. The snows bring famine; and when famine comes to keep its sentry-duty over the land, all the other forest laws are immediately forgotten or ignored. The pack forgets all its knowledge of the deadliness of men in the starving times.

The grouse heard the sound, and, silly creatures that they are, even they raised their heads for a single instant from their food. The felines—the great, tawny mountain lions and their smaller cousins, the lynx all devoted at least an instant of concentrated attention to it. A raccoon, sleeping in a pine, opened its eyes, and a lone bull elk, such as some people think is beyond all other things the monarch of the forest, rubbed his neck against a tree trunk and wondered.

But yet there remained two of the larger forest creatures that did not heed at all. One was Urson, the porcupine, whose stupidity is beyond all measuring. He was too slow and patient and dull to give attention to a rifle bullet. And the other was Graycoat the coyote, gray and strange and foam-tipped, on the hillside. Graycoat could hear nothing but strange whinnings and voices that rang ever in his ears. All other sounds were obscured. The reason was extremely simple. In the dog days a certain malady sometimes comes to the wild creatures, and it is dreaded worse than drought or cold or any of the manifold terrors of their lives. No one knows what name they have for this sickness. Human beings call it hydrophobia. And the coyotes are particularly susceptible to it.

Ordinarily the name of coyote is, among the beasts, a synonym for cowardice as well as a certain kind of detested cunning. All the cowardice of a mountain lion and a wolf and a lynx put together doesn't equal the amount the Graycoat carried in the end of his tail. That doesn't mean timidity. Timidity is a trait of the deer, a gift of nature for self-preservation, and no one holds it against them. In fact, it makes them rather appealing. Cowardice is a lack of moral courage to remain and fight when nature has afforded the necessary weapons to fight with. It is sort of a betrayal of nature—a misuse of powers. No one calls a rabbit a coward because it runs away. A warlike rabbit is something that no man has ever seen since the beginning of the world, and probably never will. Nature hasn't given the little animal any weapons.

But this is not true of the wolf or cougar. A wolf has ninety pounds of lightning-quick muscles, and teeth that are nothing but a set of well-sharpened and perfectly arranged daggers. A cougar not only has fangs but talons that can rend flesh more terribly than the cogs of a machine, and strength to make the air hum under his paw as he strikes it down. And so it is an extremely disappointing thing to see either of

these animals flee in terror from an Airedale not half their size—a sight that most mountain men see rather often. The fact that they act with greater courage in the famine times, and that either of them will fight to the very death when brought to bay, are not extenuating circumstances to their cowardice. A mouse will bite the hand that picks it up if it has no other choice.

A coyote is, at least in a measure equipped for fighting. He is smaller than a wolf, and his fangs are almost as terrible. Yet a herd of determined sheep, turning to face him, puts him in a panic. The smallest dog simply petrifies him with terror. And a rifle report—he has been known to put a large part of a county between himself and the source of the sound in the shortest possible time. If a mountain man feels like fighting, he simply calls another a coyote. It is more effective than imputing the virtue of his female ancestors. To be called a coyote means to be termed the lowest, most despised creature of which the imagination can conceive.

And besides being a perfect, unprincipled coward, he is utterly without pride. And that is saying a great deal. Most large animals have more pride than they have intelligence, particularly the bear and the moose. A mature bear, dying before his foes, will often refrain from howling even in the greatest agony. He is simply too proud. A moose greatly dislikes to appear to run away in the presence of enemies. He will walk with the dignity of a bishop until he thinks the brush has obscured him; and then he will simply fly! And there was a dog once, long ago, which, meeting on the highways a dog that was much larger and that could not possibly be mastered, would simply turn away his eyes and pretend not to see him.

A coyote is wholly without this virtue, as well as most of the other virtues of the animal world—because if one started to condemn all the cunning-eating animals of the forest he would soon have precious few of them left—but he also eats old shoes off rubbish pile. Unlike the wolf, he does not even find his courage in the famine times. He has cunning, but cunning is not greatly beloved in men or beasts. Most folk prefer a kindly, blundering awkwardness, a simplicity of heart and spirit, such as are to be found in Wolf the bear.

But Graycoat has one tendency that makes all the other forest creatures regard him with consternation; he is extremely liable to madness. Along in dog days he is seen suddenly to begin to rush thru the thickets, barking and howling and snapping at invisible enemies, with foam dropping from his terrible lips. His eyes grow yellow and strange. And this is the time that even the bull elk turns off his trail. No one cares to meet Graycoat when the hydrophobia is upon him. At such time all his cunning and his terror are quite forgotten in his agony, and he is likely to make an unprovoked charge on Wolf himself.

Now Graycoat came walking stiff-legged thru the thickets. And the forest creatures, from the smallest of the great, forgot the far-off peal of the rifle bullets to get out of his way.

A RURAL LIBRARY ON WHEELS

If you can't go to the public library, the public library should come to you. That is the opinion of the

American Library Association. At present, only forty per cent of the people in this country are enjoying adequate public library privileges. Traveling motor-truck libraries are one means of reaching those who live in the remote regions. It is for the sake of the sixty per cent that the American Library Association has adopted an enlarged program of service and pledged itself to raise two million dollars to make it come true.

The Universal Brotherhood

Bolshevik Leader: Is there anybody in this mob who knows how to run a printing press?

"I do."

Give Her Room

Elderly Aunt (to little boy, sliding down the banister): Here, Johnny! I wouldn't do that.

Johnny: 'Course you wouldn't. How would it look—an old lady like you?—Life.

IN SCHOOL-DAYS

Still sits the school-house by the road,
A ragged beggar sunning;
Around it still the sumachs grow,
And blackberry vines are running.

Within, the master's desk is seen,
Deep scarred by raps official;
The warping floor, the battered seats,
The jack-knife's carved initial.

The charcoal frescos on its wall;
Its door's worn sill, betraying

Still memory to a gray-haired man
That sweet child-face is showing.
Dear girl! the grasses on her grave
Have forty years been growing!

He lives to learn, in life's hard school,
How few who pass above him
Lament their triumph and his loss,
Like her—because they love him.

—Whittier.

A Story for Children

The Travel of a Penny

By L. M. K.

WHAT a dark smelly pocket this is! I wish I could get out. This man has no right to have me anyway, for he took me out of the collection plate as it was passed to him in church. I was feeling so happy, for a little girl had carried me to church and I had heard her tell her grandmother that I was going to help feed the French orphans. There I was lying on the plate shining and happy. I was shiny because I was new. It was only a few days ago that I was taken from the bank for the first time by a kind man, the father of the little girl who gave me into the collection. However, just when I was so happy, this miserable old tramp picked me off the plate. He must have thought I was gold for he would never have taken just a copper penny intentionally.

How can I get out? I'm here in this place so long. I'm beginning to smell of stale tobacco and the shine is getting dull from rubbing against old buttons, an old pocket knife, some rusty nails and worst of all, an ancient corn-cob pipe. I feel faint from the odor. Why doesn't he spend me for something. Maybe I'm hidden. I shall try and roll another place so that he can feel me when he puts his hand into his pocket.

I wonder where we are going so fast. A policeman must be chasing us, for I hear someone calling "Stop thief!" My owner must have stolen something else. Oh! I hope the policeman catches him, for then maybe I would get out of this horrid place, where I am not doing a speck of good, The pursued person suddenly stops

and I almost roll out. My hopes are soon cut short, as I am forced back further into my corner when he straightens up. By his sigh of relief and "What luck," I conclude he must have dodged the officer. Well, I suppose I might just as well stop worrying for I shall have to stay here anyway. This kind of a life certainly is dull.

We start to move again and then, rip! His old coat catches on a nail, as he is crawling from his hiding place. I feel a scratch, which pains me dreadfully, but my joy is greater for I see a hole which beckons me. Maybe I can work to it if only those buttons will get out of my way. My freedom is near!

Just when I am getting discouraged again, my enemy stumbles and oh, what joy! I fall onto the pavement and lie there unseen, with the glorious sun beaming down upon my dull countenance. New life starts within me and I have new aspirations. Perhaps I shall still amount to something. This is no sooner thought than accomplished. A little girl, whose clothes are all beragged picks me up with a cry. "Oh, mother, see what I have found. Now, I can help those poor little children way 'cross the water."

Once more I am happy for I am with a lot of companions, and we are all going to the same place. What a jolly time we shall have and at the same time give help to some starving orphans. I don't care what happens to me now as long as I keep going.

The feet that, creeping slow to school,
Went storming out to playing!

Long years ago a winter sun
Shone over it at setting;
Lit up its western window-panes,
And low eaves' icy fretting.

It touched the tangled golden curls,
And brown eyes full of grieving,
Of one who still her steps delayed
When all the school were leaving.

For near her stood the little boy
Her childish favor singled;
His cap pulled low upon a face
Where pride and shame were mingled.

Pushing with restless feet the snow
To right and left, he lingered;—
As restlessly her tiny hands
The blue-checked apron fingered.

He saw her lift her eyes; he felt
The soft hand's light caressing,
And heard the tremble of her voice,
As if a fault confessing

"I'm sorry that I spelt the word:
I hate to go above you.
Because,"—the brown eyes lower
told,—
"Because, you see, I love you!"

Still memory to a gray-haired man
That sweet child-face is showing.
Dear girl! the grasses on her grave
Have forty years been growing!

He lives to learn, in life's hard school,
How few who pass above him
Lament their triumph and his loss,
Like her—because they love him.

—Whittier.

Make pork cheap to sell at high summer prices

Along the

Seaboard

the south's newest great railway

On the farms along the Seaboard peanuts, cowpeas, soy beans and clover are abundant from July on. The farmers have hogs to sell at high summer prices when other sections have none.

Come to the prairie land along the Seaboard Air Line where there are low priced lands, all-year pastures and home-grown concentrates. The average acre of peanuts makes about 400 lbs. of pork—sweet potatoes make 700 lbs. Pioneering opportunities without their hardships. Livestock, general farming, fruit and vegetable growing pay well. Write for information.

Jesse M. Jones, General Development Agent
SEABOARD AIR LINE RAILWAY
Room 148, Royster Bldg. Norfolk, Va.

CONSOLIDATED SCHOOL LAW

The action of the Pennsylvania State Grange held at Allentown, disapproving the consolidated schools and recommending that a divided school term of eleven months be adopted in its place will not meet the approval of the most progressive thought of our membership.

Neither does it do justice to the Legislature that enacted the present School Law nor to the state officials who are charged with the enforcement with its many provisions. No sane man thinks for a moment that the Legislature has in mind amending the law so that consolidation shall be compulsory under all conditions, or that the State Superintendent would favor any such drastic action.

The present law was carefully worked out by members of the Legislature, aided by the Legislative Committee of the Pennsylvania State Grange. Four years being required for the completion of the work. The law is not perfect, but it represents the thoughts and opinions of the best minds in the Great Commonwealth of Pennsylvania. It is generally conceded that Pennsylvania has one of the best school laws of any state in the Union.

The law does not make consolidation compulsory, but vests the school board, or the joint school board, with large discretionary powers in establishing such schools and in the control and management of the same. If the schools are not rightly located, suitable transportation provided or competent drivers secured, the trouble is purely a local one and ought not to be charged against the law.

Article XXXVII of the School Law reads as follows:

Consolidation of Public Schools

(a) When any of Board of Consolidate Schools.

(3701) That whenever graded schools can be made to accommodate the pupils of one or more ungraded schools, by consolidating said ungraded school or schools with another school, either graded or ungraded, it shall be the duty of the board of school directors to abandon the one-room school or schools, and, instead of repairing or rebuilding the one-room schoolhouse or schoolhouses, they shall erect a suitable modern building for the purpose of consolidating and properly grading all of the said schools; Provided, that, no pupil of the abandoned schools shall be required to walk more than a mile and a half to the new school building.

Act April 13, 1911, Sec. 1, P. L. 63. This Act was amended July 22, 1919, P. L. 1117. Article XIV, Section 1406 as follows:

The board of school directors of any school district in this Commonwealth may, on account of the small number of pupils in attendance, or the condition of the then existing school building, or for the purpose of better graduation and classification, or for economical or other reasons, close and consolidate any one or more of the public schools in its district, and, upon such school or schools being so closed, the pupils who belong to the same shall be assigned to other schools; Provided, that whenever the average term attendance of pupils regularly enrolled at any one-room school in any school district of the fourth class is ten or less than ten, the board of school directors shall close such school, and provide proper transportation for the pupils of

such closed school to and from the nearest or most convenient school, to which the pupils shall be assigned. If the board of school directors do not deem it feasible to close such school, they may present their petition to the State Board of Education, showing the reasons why such school should not be closed; thereupon the State Board of Education shall consider such petition, and shall make such order as may seem just in the premises; etc.

Thus it will be seen that consolidation is not compulsory, nor has the State Superintendent the authority to make it so, the final action being left with the school board and the State Board of Education. This is as it should be, and prevents the centralizing of too much power in the hands of one man. The rights of the school board are respected and the welfare of the child given due consideration.

The Grange should become constructive rather than destructive towards our School System. The school problem is too important and far reaching to allow factions or petty jealousies to interfere. It calls for the best thought and united support of every loyal American citizen. Let us discard the bad and hold fast to the good.

In a later article we shall attempt to point out some of the evils of a divided school term and compare the advantages of a consolidated school with those of the one-room school.—E. B. Dorsett.

A STATE FAIR

I believe that Pennsylvania should have a State Fair. This state fair would be the means of showing to other states and to the world just where Pennsylvania stands as an agricultural state. This state fair should be supported by appropriations from the State Treasury to the extent that it would give it some degree of permanence. By that I mean that suitable buildings should be erected and added to from year to year as the needs require and thus make of it an occasion to be looked forward to.

On the other hand, if it should be conducted upon the plan that many of our county fairs are now carried on it would be a blot upon the fair name of our state. The county fairs with their fakirs, indecent shows and gambling booths are a disgrace to the name of agriculture. Those who are engaged in this industry of agriculture should not permit such things to exist.—V. Ross Nicodemus.

PENNSYLVANIA'S FORESTS

When we speak of the forests of the future, it is more than merely guessing. Combining our knowledge of the past with our experience of the present, we can speak with some exactness about the future as it applies to our forest lands.

Of course there are ifs and buts to be considered. IF we keep down the fires; IF we put an end to destructive lumbering and other forms of forest devastation; IF we apply the knowledge we have and so keep trees growing on the lands which should have trees upon them; and IF we take over the Pennsylvania desert and reforest it; THEN the Pennsylvania forests of the future can be spoken of with confidence, and their usefulness fifty years hence can be definitely predicted now.

BUT—Unless these things are done; unless the people of the state,

casting aside their indifference, actually do what is necessary for forest development; unless the fires are stopped; unless further devastation is prevented; and unless the Pennsylvania Desert is transformed into forests and set to work—then our prediction will surely fail.

One of two things is bound to happen to the forests of the future. Either they will be progressively more and more productive, or they will be as they are now—only worse.

I have strong faith in the good sense of the people of Pennsylvania and because of that faith make bold to predict the forests of the future. I am confident that the readers of Pennsylvania Farmer, with whom I have talked for a number of weeks about our forests and forest conditions, are a unit in their desire to assist the Commonwealth in its plans to extend the public forest work to the point where it will actually succeed.—Gifford Pinchot.

FARM READING

A daily newspaper, the community daily or weekly newspaper, and a farm journal—these are the minimum periodical reading needs of the farm home.

The daily newspaper views the affairs of the state, the nation, the world.

The community newspaper is the voice of the actions, the needs, and the purposes of the community.

The farm journal is the trade magazine of the farmer, as important to him as the grocery trade journal is to the grocer or the drug journal to the druggist.

These papers do not compete. They cover three distinct fields, no one of which the farmer can afford to neglect.

As was stated, however, these three are a minimum. A magazine of news and opinion, a woman's magazine, a magazine of fiction and special articles, a children's magazine—these are worth while also. Most farmers, too, will want more than one farm journal, the additional ones relating specifically to livestock, to fruit, or to other phases of farming in which the individual is especially interested.

The cost of all the publications referred to is small in comparison with their value and interest. There is no better investment for the farmer and his family. And now winter is approaching—the season when on the farm there is most time for reading.—Kansas Industrialist.

THE DAIRY COW

The dairy cow's a thing of charm; she lifts the mortgage from the farm, and makes the farmer's life more sweet, and sets him down on easy street. Where'er the dairy cow is queen, a country prosperous is seen, and dairymen in joyful ranks, are making bullock in the banks. Why plug along the old sad way, producing nutmegs, corn and hay, and putting up a bankrupt wall if one year's crop should chance to fail? There is a better method now—the method of the dairy cow; this critter always earns her keep, and piles up riches while you sleep and pays the taxes and the rents; and here in Idaho, gents, we have the climate and the feed, and all conditions dairies need. So let us boost the dairy cow, which beats the old breech leading plow; the Holstein and the Jersey, too, as smooth as any cow in view. Let's talk up dairies, milk and cream, the safest money making scheme.—Walt Mason in Chicago Daily News.

Farmers everywhere are buying them. Warm as an arctic. Absolutely waterproof.

The "U.S." Walrus

Wash them clean—slip them off

The most convenient overshoes you ever wore

CLEANED with a dash of water while they're still on your feet—buckled or unbuckled in an instant—warm and water-tight always—

That's why farmers everywhere are buying the U. S. Walrus. You need a pair for dozens of odd jobs around the farm.

You slip the U. S. Walrus on over your leather shoes—and push it off with your toe when you're through. Its warm, fleecy lining keeps your feet comfortable in the coldest weather.

Wherever you go—tramping through snow or splashing through water—the U. S. Walrus gives you perfect protection. And then at your doorstep—no matter how muddy they are—a moment's rinse at the pump or faucet washes their smooth rubber surface clean.

Made by the oldest and largest rubber manufacturer in the world, the U. S. Walrus is built to wear. At the very points where

ordinary overshoes are weakest, the U. S. Walrus has been made *strongest*. Every point of strain is heavily reinforced. Ask your dealer to show you a pair!

Other types of "U.S." Footwear—built for rough service

U. S. Boots have all the wear and comfort which our 74 years of experience can give them.

U. S. Bootees lace on over the sock like a leather shoe. You can wear them all day long in mud and water—your feet will stay dry and comfortable.

The U. S. line of footwear has a type for every need—arctics, rubbers, "overs." Every one is backed by over half a century of experience. The rubber comes from our own plantations—the whole process of manufacture is supervised by experts.

Always look for the U. S. Seal—it means solid wear and long service for your money.

"U. S." Boots—Reinforced where the wear is hardest. Made in all sizes and styles—Hip, Half hip, and Knee. In red, black, and white.

United States Rubber Company

Look for this seal

on all "U.S." Footwear

Fertilizers that are made right

SWIFT & Company has everything necessary to make fertilizers right: trained chemists—agricultural experts—manufacturing equipment.

The modern machinery and ample storage in our twenty-four large fertilizer factories enable us to manufacture for you a fertilizer which has all of the ingredients evenly mixed and thoroughly cured.

Through field and laboratory experiments Swift & Company knows the various raw materials, both organic and chemical, to process and combine to make fertilizers best suited for different crops and soils.

Swift's Red Steer Fertilizers furnish available plant food from seeding to complete maturity and because they are evenly mixed, each plant receives its proper proportion of plant food, thus insuring largest yields.

The Red Steer on the bag is a guarantee of highest quality.

For more than fifty years Swift & Company has maintained the reputation of making each Swift product the best of its kind.

You can depend upon Swift's Red Steer Fertilizers. Order now from our local dealer or our nearest Sales Division.

Swift & Company, Dept. 11

(Fertilizer Works)

Baltimore, Maryland Cleveland, Ohio

Grow your crops at less cost

Many farmers are making more profit from fifty acres properly fertilized than others are making from twice as many acres without fertilizer.

It costs no more for preparation of land, seed and seeding, ground rental or interest on an acre of land yielding 80 bushels of best corn or a big truck crop of good quality than for one yielding half as much of poor quality.

One sure way of growing crops at less cost is to secure more yield per acre and per man. This you can do by using Swift's Red Steer Fertilizers.

The extra bushels or pounds produced per acre by Swift's Red Steer Fertilizers are the ones that add greatly to your profit. Only the cost of fertilizer can be charged against this extra yield.

BUY YOUR NAPPANEE SILO NOW

You Won't Have To Pay a Cent Down —and— It Won't Cost You a Cent Until it Has Paid for Itself

This BIG FREE BOOK Tells How

You would put a new silo on your farm tomorrow, if you thought you could get one for nothing—wouldn't you? Well, we have a Silo Selling Plan whereby you can do just that. You can place a NAPPANEE Seal-Tite SILO on your farm and it won't cost you a cent. That sounds interesting—doesn't it? Our big FREE Book tells how you can order your NAPPANEE SILO now and make it pay for itself on your farm. Think of it! On this novel plan you virtually get a silo for nothing. A silo that will earn its own cost the first year or so and make you a couple of hundred dollars clear profit every year after that.

Better write for your copy of our big silo book today and find out all about this easy way to own a silo. The book is FREE and postpaid for the asking.

Over 15,000 NAPPANEE SILOS in Use on American Farms

Thousands of American Farmers have taken advantage of our novel Silo Selling Plan. The fact that NAPPANEE SILOS are being used in every part of the country from New England to Texas, proves that this Nappanee Selling Plan is ALL RIGHT and that NAPPANEE SILOS are "making good" wherever they go. Get our big FREE Silo Book and see for yourself the many gratifying letters of satisfaction which we have received from NAPPANEE owners. Many say that their silo paid for itself with the first crop they put in it. They tell why they like the NAPPANEE better than any other silo and some give actual facts and figures on the profit the NAPPANEE has made them.

If the NAPPANEE will produce big returns for so many other farmers it will do the same for you. And on our liberal Selling Plan you cannot afford to get along without a NAPPANEE another day.

Read What These Pennsylvania Farmers Say:

Franklin, Pennsylvania.
Gentlemen: I have a Dutch Farm and feed 25 to 30 head of cattle. I have the Nappanee Silo and it is the best thing I ever bought for the farm. The money I spent for your silo was the best investment I ever made. The Nappanee has the best under the floor ever seen on any silo. I bought the first Nappanee Silo in my section and one of my neighbors said he would have nothing but a Nappanee silo after coming to my place for two winters, and looking at my evidence, he bought a Nappanee Silo, too, last spring.
W. H. Kline.

We have many other letters as gratifying as those above in our files from this state and other states, but the limited space does not allow us to print them all.

Send for Our FREE Silo Book Today—Use the Coupon

Just fill out the coupon with your name and address, or drop us a postal if you prefer, and we will send you FREE and postpaid our new 1921 NAPPANEE Silo Book—the biggest and finest silo catalog ever printed.

It tells all about our novel Silo Selling Plan whereby you can get a NAPPANEE SILO practically for nothing. It also tells all about how NAPPANEE SILOS are made and their 25 points of superior merit, such as our Perfect Splice which is air-tight and rot-proof, our Anchoring System which is storm-proof, our Hip Roof which gives more room, our Ladder that is accident-proof, our Seal-Tite Silo Doors that are real man-sized and will never warp, and many other exclusive improvements.

No matter when you expect to put up a silo send your name and address for this BIG, FREE SILO BOOK TODAY.

NINE Out of Every TEN Silos Are Built of Wood Why?

The next time you drive to town or to the County seat, take particular note of the silos in your community, just for your own satisfaction.

We venture to predict that in your neighborhood, just like most farming districts throughout the country—that probably nine out of every ten silos you pass (or at least a great majority) will be built of wood. Why?

There Must Be Some Good Reason for This

Your own good, common sense will tell you that it would be absolutely impossible to persuade the majority of the hard headed, successful farmers in your community who own silos to build them of wood unless there were some mighty good sound reasons for giving wood silos the preference. And you can "bet your bottom dollar" there are some good logical reasons why most farmers buy wood silos.

Wood Silos Give Better Service

Did you ever hear anyone say that silos of other materials will cure silage better or keep it better than wood? No. But many agricultural experts, chemists and thousands of farmers who speak from actual experience emphatically assert that wood silos make and keep silage far better than do other kinds of silos.

It takes a certain amount of heat to cause fermentation in the silo and cure silage properly for wholesome feed. Wood is the only material non-conductive of heat and cold. Wood keeps in the heat necessary for the proper fermentation, and it also keeps out the extreme cold that causes silage to freeze.

Of course, you have to paint a wood silo every five or six years on the outside. But painting a wood silo on the outside is a whole lot easier than "doctoring" up the walls on the silo inside with some preservative preparation every few years. And remember, when the roof is on the silo you can't get a ladder inside of it.

These are some of the reasons why the majority of silos throughout the country are built of wood. And the best wood silo you can buy is a NAPPANEE Seal-Tite SILO, because they are the most practical, the most serviceable, the most useful and convenient wood silo for any farm—the silo that will give you the biggest value for your money.

Wood Silos Cost Less

A NAPPANEE SILO costs just about half the price asked for silos built of other materials. And the cost of erecting it is far less, too. You don't need a crew of skilled mechanics to erect a NAPPANEE. The average farmer can do the work himself with the help of a farm hand and finish the job in two or three days time.

Where else can you find a silo that will give you all the convenient, useful, time and labor saving features that you will find incorporated in the NAPPANEE, such as the Double Anchor System that is as near storm-proof as it is possible to make—the real Man-Sized Doors that are six inches wider than the average silo door and give ample room and comfort in entering the NAPPANEE—the extra heavy metal Door Fasteners that seal up the NAPPANEE as tight as a fruit jar—the safe and sane Ladder, built so it is almost impossible to slip and fall—the Hip Roof Rafter that are furnished FREE with the NAPPANEE and add more room to the silo, and so on all down the line.

A NAPPANEE SILO is easy to erect, easy to fill and will cure your silage perfectly. It will keep the silage in A1 condition so that it is safe to feed to your live stock. Yet the NAPPANEE costs you no more and sometimes a great deal less than other silos.

The Silo You Ought To Have At the Price You Ought To Pay

A NAPPANEE SILO on your farm will make every acre of corn you put into it do the work of two acres the old fashioned way. And the NAPPANEE is backed by an iron-clad guarantee that it will not only give you satisfactory service, but will pay for itself on your farm.

Find out about the NAPPANEE SILO today. Find out about our new payment plan, whereby you can put a NAPPANEE on your farm now and make it pay its own way. Don't fail to write for our big FREE 1921 NAPPANEE SILO BOOK as offered on this page—the biggest and most interesting silo catalog ever published. It tells all about the many time-saving and labor-saving features on NAPPANEE SILOS not found on other silos. It also tells all about our novel silo selling plan that makes it possible for you to own a NAPPANEE without it really costing you a cent. This big silo book is FREE and postpaid. Mail the coupon on this page for it, or a postal card will bring it by return mail.

Lime Requirements of Pennsylvania Soils

A Survey Made by State College That Should Prove Interesting and Valuable

Editor's Note.—The following map of Pennsylvania and the text matter are extracted from a recent publication by the Experiment Station, State College, Pa. The bulletin, No. 164, gives a summary of the survey made to learn the lime requirements of the different types of soil found in the state. By comparing the legends at the bottom with a given locality the lime requirement is easily seen.

THERE is no one soil condition more prevalent in the humid region and possibly none that has a greater controlling influence on the growth of crop-producing plants than soil acidity. The properties of such soils have been the subject of careful study for a number of years. As the result of these investigations, many conflicting theories have been advanced due to the fact that this undesirable soil condition is a complex one involving many factors which tend to arrest the normal functions of the soil. The presence of toxic substances, both organic and inorganic, the absence of basic lime and decreased availability of essential plant food constituents, no doubt, all play a part in bringing about conditions unfavorable to the best development of the chemical, physical and biological properties of the soil. It has been shown conclusively that when some form of basic lime is applied in sufficient quantities to these sour or acid soils the undesirable properties disappear and the soil will again become productive under proper management. The question of economic importance is therefore one involving the quantitative application of lime in whatever form it may be used.

The presence of sour soils in Pennsylvania and the beneficial results secured from use of lime on such soils have been known for many years. The extent and degree of acidity of the various soil series throughout the state, however, have not until recently been the subject of systematic study. In the absence of definite knowledge concerning the lime needs of the soils of the state the beneficial results derived thru the use of amounts far in excess of that necessary to meet the immediate soil needs. This liming practice has especially been the case in Southeastern Pennsylvania and thruout the great limestone valley sections of the state. On the other hand, where lime has been more expensive in sections remote from the natural lime supplies of the state, it has been used in the majority of cases too sparingly, or not at all. The most economical use of agricultural lime for soil improvement can, therefore, be brought about to the best advantage thru a careful systematic study of the lime need of the various soils. Samples of soil sent to the Experiment Station from time to time have shown upon examination to vary to

CONDUCTED BY PROF. J. W. WHITE

soil to bring about an alkaline condition. It does not necessarily indicate the amount of lime required by a soil to produce a crop of clover, but rather the maximum quantity of lime now considered desirable for a single application under general farm conditions. Lime requirement and a marked degree in the actual amount of lime required to correct the sour property of the soil. These facts, coincident with the increased cost of all forms of agricultural lime, led to the present study with the hope of securing more definite information concerning the soils of the state with respect to their relative need for lime.

The Meaning of Lime Requirement

The lime requirement is a term used to denote the amount of lime necessary to be added to a

soil to bring about an alkaline condition. It does not necessarily indicate the amount of lime required by a soil to produce a crop of clover, but rather the maximum quantity of lime now considered desirable for a single application under general farm conditions. Lime requirement and a marked degree in the actual amount of lime required to correct the sour property of the soil. These facts, coincident with the increased cost of all forms of agricultural lime, led to the present study with the hope of securing more definite information concerning the soils of the state with respect to their relative need for lime.

The other series will be divided into two groups. (1) The River Bottom Soils, (2) Miscellaneous group.

The Hagerstown series is the only extensive area of soil derived from the weathering of limestone and represents less than 5 per cent of the soil area of the state. The Westmoreland soils of Southwestern Pennsylvania are partly derived from limestone and differ largely from the De

Kalb soils in this respect. Approximately 85 per cent of the soils of the state are derived from material other than limestone or calcareous shale.

Influence of Soil Texture on Lime Requirement

The DeKalb, Southeastern Group and River Bottom soils show a higher lime requirement on the sandy soils, while the stony phase in the case of the Upshur, Hagerstown and Westmoreland soils is the most acid. The Volusia silt and clay loam is the most acid of that series. The general average for all series shows the sandy phase slightly the most acid.

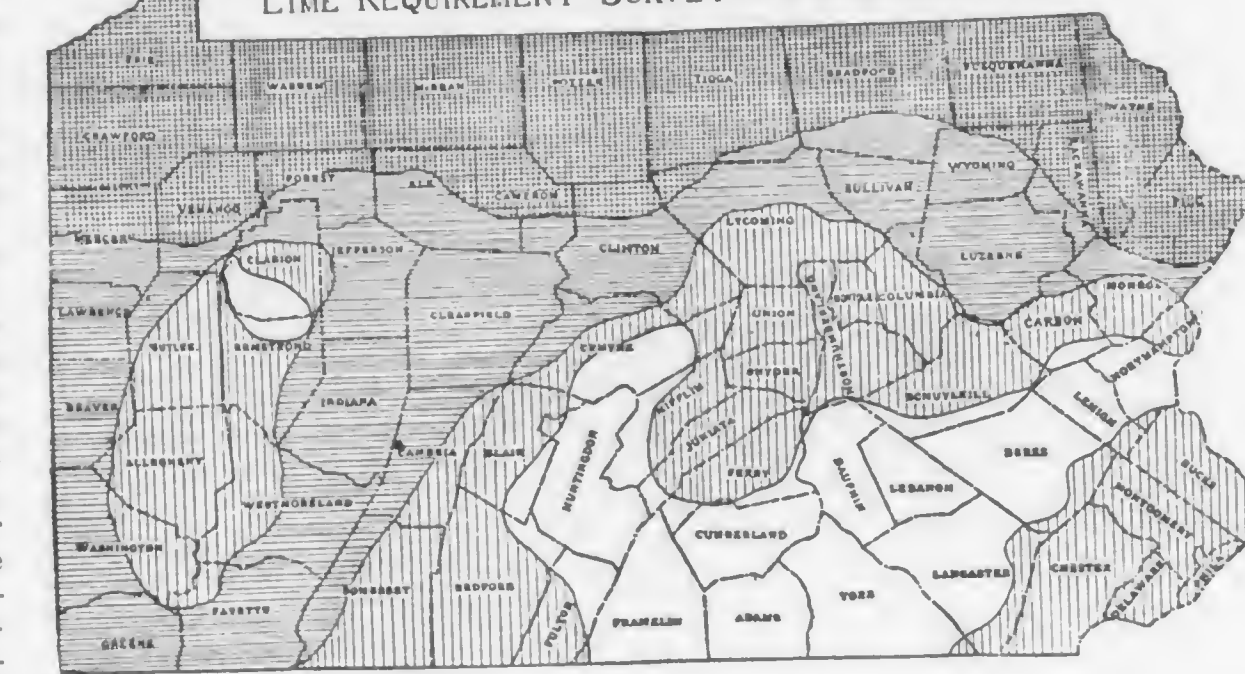

Relative Growth of Clover on Limed and Unlimed Soils

By reference to the description soil sheet which accompanied each sample collected, it will be seen that question 8 deals with behavior of legumes (especially clover) on limed and unlimed soils. There are 1200 replies to question 8 which are expressed in terms of percentage of the total number of areas which produce clover and of those on which clover fails. The term (area) as used here and in the later discussion does not refer to surface extent, but to those portions of land that are represented by individual soil samples taken in this survey. Good and medium growth are necessarily relative terms; however, a study will show a close relationship of the growth of clover to the liming of the soil.

One way to help save young apple trees from damage by mice is to tramp the snow solidly around the trunk.

Pruning is one of the odd jobs that may be done at any time during the winter when weather permits.

LIME REQUIREMENT SURVEY OF PENNSYLVANIA.

Over 1000 lbs. CaCO₃ per A. 2000-4000 lbs. CaCO₃ per A. 1000-2000 lbs. CaCO₃ per A. 0-1000 lbs. CaCO₃ per A.

acidity are often used as synonymous terms though they may not mean the same thing. The lime requirement probably takes care of both the acidity and the absorptive power of the soil for lime, both of which must be satisfied before the soil will show an excess of lime necessary to produce an alkaline reaction.

The lime requirement results discussed in this publication are meant to convey the amount of pure calcium carbonate or limestone, required in pounds per acre to produce an alkaline soil to the depth of seven inches. The lime requirement results were obtained by a laboratory method known to soil chemists as the Velch, or lime water method. This method is one of many proposed for soil studies of this nature.

The Soils of Pennsylvania

The State of Pennsylvania is approximately 150 miles in width (north and south) and 280 miles long. The soils of the state have been divided into 7 provinces and 47 series (Reconnois-

Notes From National and Nearby State Granges

Showing the Drift of Farmer Sentiment on Public Questions—Continued From Last Week

OHIO STATE GRANGE MEETING

The forty-eighth annual session of the Ohio State Grange was held in Cleveland, Dec. 14-16, with the largest attendance (around 2500) in the history of the order. It was a wonderful meeting in several respects. The Cleveland dailies rose to the occasion and each day tried to make the city people realize that this coming of the Ohio State Grange was an opportunity and event of unusual importance for the city folks.

Cuyahoga County Farm Products Show

That the farmers were taken seriously in Cleveland at least during Grange week, was one result of the splendid and extensive exhibit of farm products staged at the chamber of commerce by Cuyahoga County Granges under the direction of John Bush of Olmsted Falls Grange.

In addition to having several lessons for the city dweller as to the original cost of the finished product, such as clothing and shoes, another comprehensive exhibit detailed the materials necessary to produce 100 lb. milk, the cost thereof and the food value of milk, butter and cheese expressed in terms of beefsteak, eggs, chicken, ham and codfish. It was shown that the five-gallon can of milk for which the farmer receives \$1.60 is sold for \$8, when it is bottled and retailed at 8¢ the half pint in the restaurant.

The entire exhibit was very pleasing to the eye and the wide range of Cuyahoga County products not only illustrated a wider diversification of crops than perhaps any other Ohio county, but also showed that in arranging such an exhibit Cuyahoga County Granges possess an almost unlimited amount of endurance and the ability to carry thru a project successfully.

National Master Lowell Was There

A feature of the first day's program was an address by National Grange Master Sherman J. Lowell, who hails from Old Fredonia Grange, No. 1, Chautauque Co., N. Y., which was the first Grange ever organized in the world and which has had a continuous existence since April, 1868; its membership now is over 800. Worthy Master Lowell spoke at the public reception Tuesday, when the program was in the hands of Cleveland city officials. He dwelt particularly on the great need, that consumers must help producers eliminate some of the 14 profits taken between the farmer and the city housewife. He recounted the development in New York State of the Grange-Dairymen's League-Farm Bureau Exchange on a \$1,000,000 capitalization to buy and sell for its members.

State Master Taber's Address

Lewis J. Taber, of Belmont County, the well-beloved leader of the grange in Ohio for the past six years, was re-elected again this year for his fourth term by such an enthusiastically unanimous vote that it was an ovation. His salary was quite as unanimously raised (from \$1,200 to \$2,400) to make it financially possible for him to retain the leadership for another two years in this critical juncture of agriculture. The Grange wanted to make it at least \$3,000, but he protested.

Mr. Taber said in his annual message: "The American farmer has just received one of the most staggering blows ever administered to any industry." Farmers have expected and been willing to return to lower price levels and they had hoped that other industries would also deflate in proportion, but as yet there is little decline in equipment necessary for crop production. Because farmers were not so effectively organized as other industries the deflation has hit them hardest; credit accommodation has favored other industries, while the farmer, by reason of his once-a-year turnover of crop investment, cannot get easy accommodation. "The American farmer is tired of developing millionaire grain gamblers, packers and food distributors while farm tenantry increases and boys and girls leave our farms by the thousands."

Co-operative Marketing

"Farmers," says Mr. Taber, "must turn to community and commodity methods of doing more of our own distribution of produce. Agriculture must organize efficiently around meat, milk, grain, fruit and must realize the importance of strong financing for such commodity organizations." These ideals will have to be realized by co-operative efforts of all rural organizations. We must not cross purpose one another. Cost of production must be considered.

The past three years the Ohio State Grange co-operative department has, without charge for time or expenses, handled millions of pounds of twine and thousands of tons of fertilizer for members at a saving to them of over \$100,000. This service should henceforth pay the overhead for time and expense. We should incorporate with capital stock, enough to do business in a strictly business way, then return all profits to members of this corporation. Here in Ohio the Grange, farm bureau and other farmers' co-operative associations might incorporate with at least \$1,000,000 capital, as has been done in New York. The directors should represent equally the component organizations. Or else we might organize a holding company to act for existing co-operative agencies.

Ohio Grange Growth and Finances

In point of new Granges and membership increase 1920 was the best year since 1875. Five Pomona (county), 33 juvenile and 86 subordinate Granges were organized and three subordinates re-organized. From 821 Granges, with 87,509 members on Dec. 1, last year to 909 Granges with over 102,000 members on Dec. 1 this year was the report of Sec'y W. G. Vanderbark, and every one of these is in good standing on the secretary's books.

Increase in Dues

Action was taken to increase minimum dues in subordinate Granges, beginning Jan. 1, 1921, to 51 cents a month instead of 10 cents as now, and to raise the initiation fee to \$2 for men and \$1 for women, girls and boys. Quarterly dues to state Grange were increased to 11 cents (from 9 cents); and fee paid by sub-Granges to state Grange on new members is to be 50 cents instead of 25 cents as heretofore.

Grange and Farm Bureau

It was very inspiring to note the clear conception in the minds of the bulk of the members present of the ideal relation of the Grange and the farm bureau. In the deputies' meeting one found the best deputies active supporters of the farm bureau in their counties.

MARYLAND STATE GRANGE

It would have been well if all of our members could have attended the 48th session of the Maryland State Grange at Frederick, Dec. 6th to 9th inclusive. They would have gone back to their subordinate granges full of renewed zeal, determined to stand by and "carry on."

Monday evening, Dec. 6th, the meeting began with a reception. On a large stage on which palms and blooming plants were gracefully arranged, Brother A. S. Remsburg, Master of the Frederick County Pomona, welcomed the visiting delegates and all others. The Flood College girls gave us several songs, the Misses Staley danced delightfully and our own Maryland University quartette sang for us.

Brother Emsey L. Coblenz urged the boys gone cityward to return to the farms. He said: "I am amazed that young men will leave excellent homes and glowing prospects for the uncertainty of city life and work in factories, and I cannot understand why a country girl will refuse the hand of a farmer, roughened by toil, and accept that of a hireling of the city to live in a stuffy flat without a foot of ground attached. I can say this—the country and state need brains, and the country is the place to find them."

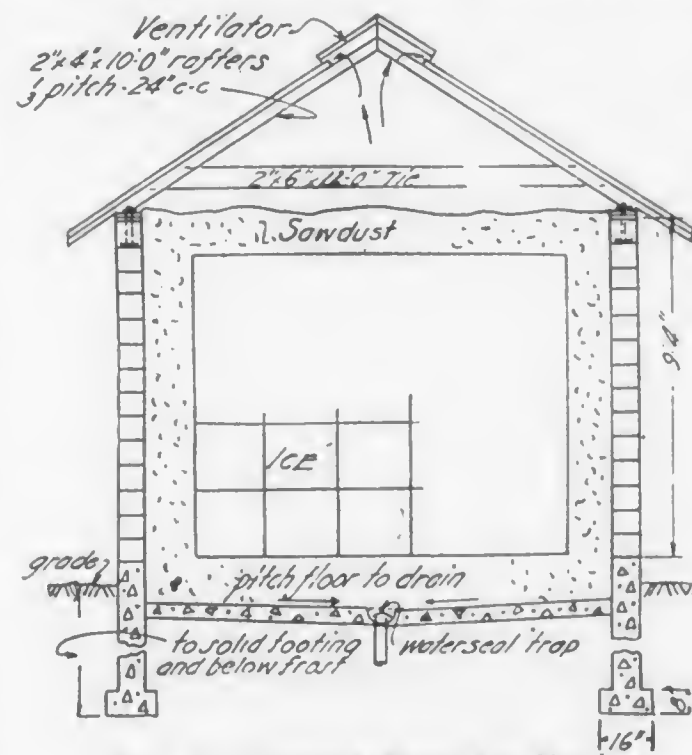

Monday and Tuesday evening meetings were open to the public and well attended. On the latter evening Dr. A. F. Woods, president of the University of Maryland, made an address on "The Future of Agricultural Organization in America." Later in the evening Secretary of the United States Department of Agriculture E. T. Meredith arrived. He told the farmers that the problem they are facing demands the wisdom of a Solomon or an Edison and he who can find a solution for that problem, high wages and low prices for products, will be greater than the two. He stated the infinitesimal amount of money devoted to agriculture, that out of every \$400 raised in taxation, \$374 goes to war or war purposes and then are left but \$26 for other things, and but \$1 of that \$26 is devoted to agriculture. He also said that if the government spends 93 cents out of every dollar for war we should insist that the other seven cents be spent for agriculture.

Secretary Meredith stated that if the quarter of a million dollars annually expended for "free seeds" could be diverted to agriculture it would be used for a good purpose and that the "free seed idea" was merely an advertisement for the senators or congressmen.

The day sessions of Tuesday, Wednesday and Thursday were devoted to business. No definite marketing program was outlined. Many resolutions were adopted. Among them, one favoring an appropriation of \$40,000,000 for agriculture and against \$250,000 used for "free seed." Another, favoring the enforcement of the Volstead Act and against any change in same.

By resolutions the principles of the Capper-Volstead bill, the French truth-in-fabric bill, Standard Containers (Vestal bill), and the Kahn-Wadsworth bill were endorsed.

One hundred and eleven candidates received the Fifth Degree and 215 received the Sixth Degree. The next convention of the Maryland State Grange will be held in Cambridge, Dorchester County, December, 1921.—Marylander.

Plan for Concrete Block Ice House

Concrete Block Ice House Complete

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

AVAILABLE PLANT-FOOD

THE manufacturer's definition of available plant-food is somewhat different from the soil investigator's or the farmer's definition. By "available" plant-food the manufacturer means laboratory availability, that is, the fertilizer manufactured by him and containing available plant-food must meet certain chemical tests. The farmer and soil investigator think of plant-food in terms of crop yields. It is evident that the season, the climate and the soil type have much to do with the rate at which food is taken up by plants from the soil. No correct forecast can be made on this point, since growing conditions are not the same from season to season or in different soils.

It is recognized, nevertheless, that fertilizers which readily dissolve in water or in certain chemical reagents will, under average conditions, be readily taken up by growing crops. Hence, it is the manufacturer's effort to produce fertilizers that show high-rate of solubility. Among the best known fertilizers many meet this solubility test. For instance, nitrate of soda, sulfate of ammonia and muriate and sulfate of potash are easily soluble in water. A very large proportion of the phosphoric acid and lime in acid phosphate is also readily soluble in water. In materials like bone meal, ground fish and basic slag the phosphate of lime dissolves readily in citrate of ammonia or citric acid. These are solvents, or reagents as the chemist calls them, that should indicate the crop-value of phosphates.

Of late years there has been much progress made in the manufacturing of fertilizers from the standpoint of availability. Where a few years ago acid phosphate containing 14 per cent of available phosphoric acid was the standard product, there is now a tendency to use material that contains 16 or even 17 per cent of available phosphoric acid. Further progress in this direction is indicated by the manufacture of so-called double superphosphates. One or two of the large mining companies producing sulfuric acid as a by-product are seriously considering the manufacture of double superphosphate containing 45 to 50 per cent of available phosphoric acid.

The manufacturers of nitrogen products are also making decided progress in this field. In the development of the manufacture of so-called air nitrates a study is being made of the practicability of putting on the market materials like nitrate of ammonia, containing about 34 per cent of nitrogen, or of urea containing nearly 47 per cent of nitrogen. Among potash fertilizers muriate and sulfate of potash, both manufactured products, contain 50 per cent of actual potash. There is a further tendency to develop the manufacture of chemical salts containing two or even three plant-food constituents. Thus, a product known as Ammo Phos contains 10 to 11 per cent of nitrogen and 48 per cent of phosphoric acid. This is a salt easily soluble in water. It is possible that there may be developed in time single salts containing nitrogen, potash and phosphoric acid. It is pointed out that such products are likely to be more valuable than the less concentrated materials for two reasons. In the first place, such concentrated products are for the most part

easily soluble in water. This means a more ready and more uniform distribution in the soil. In the second place, these products, because of their greater concentration, will furnish in a much smaller bulk a large quantity of available plant-food. By way of example, it may be stated that a mixture made up of

350 lbs. Ammo Phos
200 lbs. nitrate of soda
200 lbs. muriate of potash

will contain in 750 pounds the equivalent of one ton of a 4-8-5 fertilizer, that is, one furnishing 4 per cent of ammonia, 8 per cent of phosphoric acid and 5 per cent of potash. Even a greater degree of concentration may be obtained by using nitrate of ammonia and muriate of potash of a greater degree of purity. Since the cost of a mixed fertilizer is determined, in large measure, by the cost of handling and transportation, the higher grade fertilizers are, everything being equal, more economical than the lower grade fertilizers. A mixture offering in 600 or 700 pounds the equivalent of one ton of what we now regard as a good fertilizer would require one-third of the number of bags, one-third of the amount

distribution of 300 or 400 pounds of fertilizer per acre. Hence, our fertilizer distributing machinery will have to be improved to provide for such uniform distribution. Our fertilizer drills will have to be further modified to allow the placing of the fertilizer at some distance from the seed in order that the latter may be located at some distance from the strong solution of salts. In this manner the seed and the young plants would be protected from injury for a time long enough to allow the chemicals to be gradually diffused in the soil and to become changed in it so that they may no longer cause a so-called burning effect. It is safe to predict that within the next five or six years there will be very marked progress made both in the manufacture and use of the more concentrated and available forms of plant-food. This is bound to mean more efficient and more economical methods of crop production.—J. G. Lipman.

A COLONY HOG HOUSE

This 6 by 8-foot colony house has proved its value where it has been used. It is a gable-roof house with the roof doors on one side to be opened for sunlight. Build the plank floor first. Timbers 4 inches square for the outside make excellent runners and a 2 by 4 in the center stiffens the frame.

Next comes the framing work, which is made of 2 by 4-inch lumber. This is placed on top of the plank floor. The outside studdings are 24 feet high and are placed at equal distances, or about 2 feet 4 inches apart. On the north slope or opposite the slope where the doors or windows are to be placed, there should be a wind brace between the rafters so as to keep the house rigid at all times. The siding material used is a 10-inch dressed shiplap. This material can be used for the doors, roof and siding and will result in a good, tight and warm building that will be free from drafts.

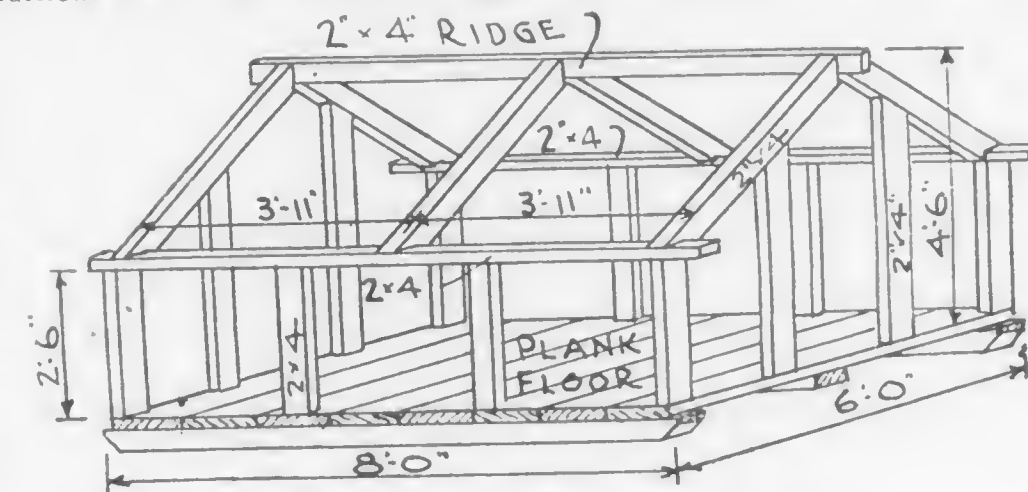

The roof doors, which are on the east or south, of the house are hinged at top or side and each door is 3 by 4 feet in size. Extra heavy 8-inch strap hinges are used. The entrance door may be placed in the middle of the gable end, or near one corner of the end or side. The side or end, is the best because the swine are better protected from drafts. The size of doorway is 24 by 30 inches, but may be made larger, and higher by building the sides higher, say 6 inches or so. Some of the large breeds demand higher doorways than specified.

In cold weather a piece of burlap or ducking hung at the top of the door, with a stick a little shorter than the width of the door nailed across the bottom to prevent the wind from blowing it back, will help to keep the pigs warm. The pigs will soon learn to hit the curtain when they want to go thru. The board doors would not then need to be closed except in very bad weather, or while the pigs are very small.

Pig fenders to protect the young pigs at farrowing time are easily built by fastening 2 by 4 pieces flatwise to the sides and ends about 6 inches from the floor. They should be removable.

A satisfactory method of ventilation is provided by leaving an opening or moderate size through the ridge pole, protected by nailing a thin triangular board under and flush with the edge of the extending roof boards. The wind is protected by this arrangement from sweeping down the house.

This kind of house needs two coats of paint. It will thus last longer and look better and will prove to be a good investment if cared for properly. An occasional spraying of the inside walls acts as a preservative.—Harley M. Ward.

Plan of Hog House Built on Runners

of labor needed for the filling of bags, one-third the cost of handling and transportation. Less storage space and fewer cars will be needed for storing and transporting such materials.

From the farmer's point of view, such concentrated and available fertilizers would also possess a distinct advantage. He would also save much labor and time in hauling the fertilizer from his freight station to his shed. He would save labor in the handling, and carting the material to his field. By drilling or broadcasting 100 pounds of a very concentrated fertilizer, he can accomplish the same results as he can now with 300 or 400 pounds of the less concentrated but relatively high-grade fertilizer of the present day. However, the more concentrated and more readily available fertilizers have their drawbacks as well as their advantages. It is

Plan for an "A" Colony Hog House

well known that as a fertilizer dissolves in the soil moisture a strong solution of chemicals is produced. If proper care is not exercised in the distribution of the material, a very strong solution is formed in the soil and this may retard or entirely prevent the germination of the seed. It may also injure the roots of the young plants. As a farmer would put it, the fertilizer may "burn" the crop. It is quite apparent, also, that the uniform distribution of 100 pounds of fertilizer per acre is more difficult than the uniform

Ten Acres a Day Plowed Right Soon Pays for Your E-B Outfit

An E-B plowing rig is built to show you steady, economical work in 1921 and a profit that you'll welcome. For tools that save time and money are the quickest way to cut down cost of farm production now.

With an E-B 12-20 Tractor and an E-B Tractor-plow you can break ten acres a day in stubborn soil. A good day's work, but the tractor never hesitates. And an E-B Plow always does a clean job because it has strength, light draft and the construction that 68 years of experience has taught us is right.

An E-B Outfit bought now will help you save all year.

FALSE ECONOMY

The stock-keeper who would save on his feed bill is quite likely to cheat himself. When we consider that the value of an animal is largely determined by its ability to handle large quantities of feed, turning them into a higher priced commodity, we can understand why the above statement is true. I am inclined to believe that ninety per cent of unprofitable production in the dairy is caused by the lack of proper feeding. Farmers are confronted this year with the problem of what is best to do with their large crops of grain and forage. Especially is this true of corn, which is undoubtedly the largest crop we have ever grown. We find the market not only falling, but with a poor chance for improvement. Why not feed some of this good corn to dairy cows?

In reviewing some of the bulletins issued at the Nebraska Experiment Station, I find a record of a herd for a series of years, together with figures determining the cost of butterfat production. Using the prices given at that time for both feed and butterfat, and transferring them to conditions such as we have now, I find that with such a herd, corn can be made to produce \$2.40 a bushel when fed to good dairy cows. This is basing

then of feeding to cows, which are no better than ours if as good, and then have the product of his cows made into butter and sold on our New York and Chicago markets in competition with ours, it simply means that we are not making the best use of what we grow on our farms, or else that we are not willing to pay the price of profitable production. This very day Danish butter is being sold in New York and Chicago in competition with our product. By cutting out this false economy in depriving the good dairy cows of proper feed, we can drive every competitor out of our market in three months; and, more than that, we would be able to sell butter in any foreign country and at a profit. We are in a position to produce butter in this country with the greatest economy.

Returning again to the subject of giving the cows plenty of feed; the average dairy cow consumes about fifteen pounds of feed per day of what we call maintenance ration—that is, the food required to keep the cow alive, warm and to replace waste. We might say it is the board bill of the cow. Now if the cow can consume thirty pounds of feed, then we are interested in the fifteen pounds which is not used for maintenance

Duke's Rachel Interested 282540. For 5 Years Averaged 10,752 lbs. Milk and 584 lbs. Butter Per Year

the butterfat at fifty cents a pound, but rather for production. If the it would indeed be a fine thing if we could market our corn for \$2.40, and that is just what can be done if we have good milking cows and give them good care. This does not call for a high grain ration, but just for an average ration of from four to twelve pounds of ground corn a day, with plenty of alfalfa hay and some corn silage and a little oil meal.

We are now confronted with conditions very different from those of the war period, and we must adapt ourselves to the change. It is false economy to figure that corn or grain is wasted when fed to good producing animals. The fact is that the chief use of corn and other grain should be on the farm where it is grown, and where it can be turned into a high priced finished product. If the Danish farmer can buy our oil meal, corn and other grain, pay the freight to the seaboard and the high priced shipping charges, pay the costs of distributing to farmers and

per bushel thru a good dairy cow—and I have every reason to believe that it can be—basing the figures on six years work by a herd of cows in Nebraska—then certainly it seems to me that is not wasted corn when it is fed to dairy cows. Another viewpoint: would it not be wise to market more of our corn by feeding it on the farm and retaining the valuable product of fertilizer, thus equalizing farm labor and altogether making a more economic and dependable line of production?—A. L. Haecker.

ANNUAL MEETING NATIONAL DAIRY COUNCIL

The annual meeting of the National Dairy Council was held in Chicago December 2, 1920, at which time a very large representation of all branches of the dairy industry was in attendance. A very excellent program was given and much enthusiasm created for the development of the National and State Dairy Council work.

In addition to the comprehensive report of the president, Mr. Walter J. Sears, president of the National Canners' Association, gave a most excellent address on the value of co-operative publicity, outlining the wonderful results which have been achieved by various other industries which have resorted to co-operative publicity, and outlining to some extent the comprehensive work which is now being conducted by the National Canners' Association of America.

An address was also given by Mr. H. C. Campbell, in charge of educational work, Portland Cement Association. Mr. Campbell outlined in a very interesting manner the advantages of co-operation within all industries. He stated that it mattered not whether the industry handled a food product or some other commodity, that it was a proven fact that co-operative publicity was very necessary to the success of that industry.

Hon. Frank O. Lowden, Governor of Illinois, was also in attendance and gave a very inspiring talk, emphasizing the importance of co-operation and getting together at this critical time in the world's history. Governor Lowden stated that the dairymen must unite and so tell their story as to let the public know the fact regarding dairy products, because of the importance of these vital foods to human and national welfare.

HERD BULL NEEDS GOOD CARE

Cost must not play the important part in caring for the herd bull, which needs as much attention as does the milking herd. When six months old the bull calf should be separated from the heifer calves and fed a ration that will keep him growing rapidly. At this age from four to eight pounds of grain daily, depending on his size, is the amount recommended by dairy specialists of the State Agricultural College.

Most dairymen prefer to feed bulls the same grain ration that is fed to the other growing stock. But in addition, good leguminous roughage is necessary, the amount depending on the size of the animal. Mature bulls will often consume 15 pounds of hay daily. Silage may be fed to the growing bull in small amounts, and up to 15 pounds to a mature animal.

A common grain ration for the mature bull after complete growth is:

- 3 parts corn meal,
- 3 parts ground oats,
- 3 parts wheat bran,
- 1 part linseed meal.

Along with this ration should be fed leguminous roughage and some corn fodder or stover. To keep the bull in excellent condition, but not fat, exercise is a factor that must not be forgotten. If the bull cannot have access to a yard at all times, he should at least be tied outdoors each day and allowed to go back and forth on a cable.—N. Y. State College of Agriculture.

From feed store to bank

What really counts in feeding is how much of the milk check gets into the bank to help increase the balance. That is largely determined by how much of the daily ration is digested and utilized by the cow. Some of the milk check must pay for feed, but how much goes to the feed bill and how much to the bank depends on the kind of feed and how well it forms a balanced ration with the roughage used.

Roughage grown on the farm is one of the best sources of profit in dairying, for its digestible nutrients are worth pound for pound as much as those contained in the grain feed that is purchased. But to make the food elements in the roughage available, it is necessary to use concentrates which will combine with them to form a balanced ration, and as roughage varies in nutritive content, it is necessary to provide different concentrates to be fed with different kinds of roughage.

TI-O-GA FEED SERVICE

has classified different kinds of roughage into three groups according to their nutritive value, and compounds a dairy feed to combine with each group and form a balanced ration.

Red Brand
TI-O-GA Dairy Feed
to be fed with low protein succulent roughage: Silage, Pasture, Green Fodder, etc.

White Brand
TI-O-GA Dairy Feed
to be fed with medium protein dry roughage: Timothy Hay, Mixed Hay, Corn Fodder, etc.

Blue Brand
TI-O-GA Dairy Feed
to be fed with high protein dry roughage: Clover Hay, Alfalfa, etc.

In each case the cow gets the same amount of nutrition in the same nutritive ratio, and you get more money from your roughage. If your dealer does not have the kind of TI-O-GA Dairy Feed to balance your roughage, advise us and we will arrange for some nearby dealer to supply you.

Send for book on TI-O-GA Feed Service which tells how roughage may be utilized to best advantage and profits increased.

Welcome Suggestions

THE RESPONSE by our readers to the invitation published a few weeks ago to send us suggestions, comments and criticisms has been most gratifying. We have received a great number of letters, every one of which is highly appreciated and will be given most careful consideration upon second reading. While we are glad to read the nice things said about Pennsylvania Farmer, we are equally glad for the suggestions of what our readers would like to see added or changed. We have been interested to note that we have previously planned for practically every helpful improvement suggested but owing to the limitations set by war-time conditions we have not been able to add them. However, we shall do our best to make every improvement possible as fast as we can. Our readers are kindly requested to continue this practice of writing us their opinions and suggestions.

Without attempting a resume of the letters received, this is a good place to mention one request that is almost unanimous: "Print more County Notes." This is just what we should like to do if we can get them. We would like to have a correspondent or two in every county in our territory who would send us a brief note about general conditions, weather, crops, prices, etc., in their county at least once a month. We shall be glad to send paper and stamped return envelopes to those who tell us on a postal card that they will do this. By co-operating with us in this way you can help us to make our paper still better.

Only one writer out of the many suggested that we could use the page devoted to "Passing Events in Pictures" to better advantage. The majority commented favorably on this feature. We hope to profit by the good suggestions made by our readers just as fast and as far as it is practicable to do so.

Repeat The Brooks Law

GOVERNOR SPROUL and ex-Attorney General Shaffer have expressed themselves as being in favor of repealing the Brook's Liquor License Law and the enactment of an enforcement act which would be in harmony with the Volstead Act. The presence of the Brook's Law on the statute books has been interpreted as being in force in spite of the national law and hence many license judges are still granting licenses. Write the Governor and your representatives in

Pennsylvania Farmer

the Legislature to vote for a repeal of the Brook's Law and in favor of an enforcement law with teeth in it.

Courage The One Needed

THE FOLLOWING condensed reprint of a recent editorial in the North American so well sums up the business conditions of today and is so closely in line with our own ideas that we gladly pass it along:

According to all competent authorities, the violence of the fall in commodity and security prices in this country during the last few months has been unprecedented. The declines have been more precipitous than ever before recorded in our history, and greater than in any other important commercial country in the world. On December 1, the index numbers of prices were at their lowest in four years; within six months 60 per cent, it is estimated, of the price advances made during the last six years has been canceled. If such losses had fallen upon business in any other nation, expert declare, they would have resulted in commercial paralysis, serious conditions of unemployment and widespread suffering.

A few general statements will indicate the magnitude of the shrinkage, expressed in dollars. Agricultural products, it is estimated, have shrunk in market value \$5,000,000,000. In merchandise there was a month ago an aggregate recession of \$3,000,000,000, and probably there has been a further drop of \$1,000,000,000 since then. Quotations for securities including the soundest and best paying show losses of many billions more.

One's first thought will be that such staggering figures must be reflected in business stagnation, if not disorder; yet no such evidences are to be found. In looking for the effects one turns first to the record of business failures. Of these there were week before last 337, and in the week previous 296. These totals are nearly three times as high as during the abnormal prosperity of the war period; but in the years immediately preceding the war the weekly average was about 300, so that there has been no threatening rise. Furthermore, the number of business enterprises increased enormously during the last six years, hence the percentage of failures is really small.

If conditions were bad the savings banks deposit would show a decline, but they are swelling. When a situation of panic is imminent money becomes plentiful at low rates, because there is no business expansion to demand new capital; but money rates today are high, and the banks report a tremendous demand for funds to be invested in production. While bank clearances show a decline, it is not relatively as great as that in commodity prices, so that the volume of business is steady. In reserves the banks are exceptionally strong. Railroad earnings provide one business barometer; railroad business has recovered from the high war level just far enough to relieve congestion and enable the lines to handle their enormous traffic expeditiously. Moreover, the railroads have passed thru their most critical period, and are in a stronger position than at any other time during the last twenty years.

But the most direct evidences of what the business situation is are to be found in the retail field. Taking a dozen of the principal cities, all except two showed in October a decided increase in retail sales over the same month last year. New York's increase was 6.23 per cent; Philadelphia's, 15.8; Chicago's, 6.8; San Francisco's, 8.2, with an average of 9.8. Comparing the four months, July-October, inclusive, for the two years, retail trade in these cities increased an average of 15.5 per cent. Experts say there is every reason to believe that the Christmas trade this year will equal the unprecedented volume reached in 1919.

The facts and conditions we have cited are basic indices of the economic situation. They are admittedly determining factors in the situation, and could not exist if the foundations of business were not sound.

Yet the continuance of business and industrial prosperity does not depend upon economic factors alone; however favorable they may be, they can be overcome by other influences. It has long been recognized by the ablest writers upon financial and commercial matters that there is a psychological force which perceptibly and often

emphatically affects the currents of business.

The word psychology, once restricted to the use of scientists and scholars, has acquired a well understood popular significance as a result of the world conflict, during which war was waged by the producing of psychological effects. Next to her army and her submarines, Germany's most potent war mechanism was her world-wide system of scientific propaganda, wherewith she spread in the countries of her adversaries influences promoting discouragement, discontent and disunion, together with a belief in her invincibility. It was not her armies that defeated Russia, but the deadly psychological effects of propaganda by her agents. It was by this method that she brought Italy to the verge of disaster and created not a little trouble even in this country * * *

Business is just as susceptible to psychological influences as is the public mind of a nation; or rather it is infinitely more susceptible, for far-reaching effects can be produced without organized effort and even without conscious intent. Fear and faith are factors as influential in undermining or upbuilding prosperity as are varying conditions in respect to credits, wages, employment or consumption demand for goods. It is easily possible for prosperity to be wrecked because of fear or loss of confidence at a time when fundamental economic conditions are strongly favorable.

That is the situation that prevails today. Every indication, as we have shown, testifies to stability and sound growth. The only menace comes from the psychological influence of calamity-howling, from the goggle-eyed talk of rumor-mongers and the malignant or merely witless whisperings of mythical business troubles * * *

Our Washington Letter

The United States Warehouse act is the best law that has been enacted for the farmers, the warehousemen and the bankers, in a long time, and its beneficial results are obtained without injuring anyone, said H. K. Holman, investigator in warehousing in the Department of Agriculture, in an interview. At this time when the attention of the people is directed to better marketing and financing problems of the farmer, it is the belief of Mr. Holman that much publicity should be given to the act and its provisions.

The Federal Warehouse act became effective in 1916 and was amended to meet the market requirements and extend its usefulness in 1919. During the war little progress was made in developing the system provided for by the Warehouse act, beyond the building up of machinery to enforce it and prepare regulations and forms to be used.

The United States Warehouse act provides for the licensing of warehouses under bond in which are stored such agricultural products as cotton, wool, grains, tobacco and flaxseed. In securing a license each warehouseman agrees to comply with and abide by all the provisions of the act. The issuing of licenses is done under the authority of the Secretary of Agriculture and the enforcement of the law comes under his department. Each warehouseman is compelled when applying for a license to give sufficient bond to the United States to secure faithful performance of his obligations as a warehouseman, and the bond shall contain such terms as are prescribed by the Secretary of Agriculture. Any person injured by the breach of any obligation under the act shall be entitled to sue on the bond in his own name in any court.

It is the belief of government experts who have given much study and time to the development of the bonded warehouse system that it should be given more attention and publicity by the agricultural press and the farm organizations. It is evidently a movement in the right direction, which may be the beginning of a great nationwide system of bonded warehouses for the storage of farm products, and the basis for a safe, efficient system of credits for producers.

Representatives of the American Farm Bureau Federation appears before the Senate Committee on Agriculture and Banking in a joint hearing and presented their plans for relieving the present marketing situation and providing for the necessary financing of the producers.

President J. R. Howard of the federation, called the senators' attention to the effects of the recent increase in railway freight rates upon the farmers. Farmers, he said, get the world market price less the transportation expenses, the price in Liverpool minus the cost of getting the wheat to Liverpool. The cost of getting a bushel of wheat from Omaha to Chicago used to be 12 cents. A margin of 21 to 23 cents a bushel is now asked for this service, the extra cost being freight charges. This makes the farmers' price ten cents a bushel less than formerly. Mr. How-

January 8, 1921

January 8, 1921

and asserted that the farmers cannot stand another advance in rail rates.

The Farm Bureau Federation favors an extension of credit to all nations, according to Mr. Howard. It has never advocated direct loans from the United States Treasury to foreign countries. The federation's plan provides for extension of credit, by using such security as foreign countries might be able to give for the purchase of farm products, such securities to be deposited with the American Corporation and sold to American investors or debentures issued upon them. The War Finance Corporation would become a clearing house between foreign nations and the United States in the extension of foreign credit and markets.

In regard to security from Germany, Mr. Howard suggested that with the consent of the Reparations Commission, the American credit could be made a first lien on all the property and income of that country. * * *

Speaking of the proposed emergency tariff, the speaker said "we demand the same protection for the farmers that industry has." As regards the storage of farm crops, Mr. Howard said the key on which the credit system is to be worked out is the warehouse certificate plan. * * *

After a debate of several hours in the Senate on the Fordney emergency farmers' relief tariff bill, passed by the House, it was referred to the Senate Finance Committee, where attempts will be made to have several commodities included in the bill, which were left out by the House. Secretary A. M. Loomis of the National Dairy Union, has been requested by members of his own and other organizations to see that a tariff on dairy products is placed in the bill. He is making a strong effort to get a hearing before the committee on this matter. Senator McCumber announces that "a fair and adequate consideration" of the bill will be had, and it is reasonable to expect that the dairy industry will have an opportunity to be heard by the committee. There will also be a strong effort to have frozen and refrigerated meats included in the measure. The chances of the bill becoming a law under the present administration are far from favorable.—Elmer E. Reynolds.

HARRISBURG LETTER

Legislative Harmony.—It has been a long time since men having different ideas about the management of the dominant party in Pennsylvania politics have gotten together with such unanimity on organization of a legislature after having been upon the verge of a contest for control which would have stirred up the whole state. The organization of the general assembly this year not only presents a singular example of one man leadership, but also of how Keystone State political history repeats itself. Some ambitious plans formed after the close of the last session have been given up and in the face of an extended legislative program, a date for early adjournment has been set. It seems to be the general idea among men in high places in the Republican state organization that the general assembly should do its work quickly, pass comprehensive legislation on important subjects, levy no new taxes and give the party no more to explain or defend than necessary.

The Financial Side.—From all accounts there will be no tax imposed on capital engaged in manufacturing or on coal or any other natural resources. The position is taken that the people are paying enough and instead there will be a stiffening up of the collections under present laws. Auditor General Charles A. Snyder told the State Constitutional Revision Commission there was no need of new tax laws and that the revenue could be made ample to meet reasonable appropriations. There is a disposition to take him at his word and to keep the appropriations within the estimate. Incidentally, this situation will permit of some practical working more closely resembling a budget than ever before. The Legislature will be given a limit on appropriations and the chairmen of the

Pennsylvania Farmer

9-33

appropriations committees will take up with the Governor various bills for credits and other objects.

Agricultural Bills Early.—Secretary of Agriculture Fred Rasmussen will send in his agricultural bills early. He will endeavor to secure the aid of counties in agricultural statistics by a bill providing for ascertaining of certain facts when the triennial assessment is taken. There will also be some amending up of various inspection bills and better allowances for the work of various bureaus, especially for control of seeds and animal diseases.

Oleo Pays the State.—The value of oleomargarine licenses to the state is shown by the fact that the revenue from this source for 1920 was almost \$630,000 and that the 1921 applications start off at a rate which indicates a still greater revenue this year. The number of retail licenses issued went over the 6000 mark for the first time, being a jump of about 500. The retail licenses comprise most of those issued. The usual drive to take off the license can be looked for, but it will not get very far.

The Constitutional Convention.—While the State Administration is disposed to insist upon a constitutional convention so that the results of the year's study may not be lost chances are there will be stiff opposition to any such proposition in both branches of the Legislature. An effort is to be made to prevent any such question going to the people and unless the State Administration takes a very firm stand the bill may go the way of similar measures in years gone by.

As to Consolidation.—Most of the speakers at the recent educational meetings appear to regard as a foregone conclusion that consolidation of schools was going to be general in the state once the cost of construction is stabilized. However, there remain to be voted upon over a score of such projects. According to what Dr. L. L. Driver, chief of the rural education end, said, over 600 one-room schools have had to be closed in the state lately, 534 of them because of lack of attendance. Rural districts have been the greatest sufferers, just as they have from lack of teachers.—Hamilton, Harrisburg.

NEW YORK LETTER

Farm Interests Consolidate.—Consolidation of agricultural interests of the state was effected last week when 33 farm and traffic organizations sent representatives to Syracuse. There is great need of some body deemed capable of speaking for farmers at all times with authority, and with power to take action to obtain the needs of farmers. Bankers and consumers were also represented and together all will work out a definite farm policy. The committees appointed will report at Albany in January.

Crop Insurance.—A new idea is that of crop insurance, now being promoted in Genesee and other counties. A few farmers will give a trial to the plan of insuring a yield equal to 50 per cent, the average yields on the farm involved, for the past three years.

Pooling Plan Proceeds.—Tompkins county is pushing the pooling of milk sales and now has 590 signers. State leaders in agriculture are urging the adoption of the plan at once. The number of leaders or workers to present the plan to the dairymen is limited, and this handicaps its growth somewhat.

New Price Proposal on Milk.—When the Milk Conference Board refused to pay the January price of milk asked by the Dairymen's League, \$3.15 per cwt. of three per cent milk, the same price paid in December, the new head of the League, G. W. Slo-cum, announced that a drop of 10c below this price would be accepted if the dealers would drop the retail price a cent a quart in January. This would be making a reduction of 3 cent a quart for the dealers, as compared to the drop of 1 cent made by the dairymen in December and January while the consumers would benefit to the extent of two cents a quart. This is putting the dealers into a situation unequalled for concessions, as it has been for years the practice of dealers to raise the retail price a

whole cent whenever farmers raised it a half cent, or two cents when the wholesale price lifted a cent. Never have they made a real sacrifice such as the League now demands of them, and such as ordinary decency demands at a time when everyone is making very real price concessions. The public awaits the result with interest.

NEW JERSEY NEWS

1921 Legislature.—The 145th Legislature of New Jersey will convene here on Tuesday, Jan. 11, and if Majority Leader of the House T. Harry Rowland, of Camden, and other leaders in the Republican majority of both Senate and Assembly have their way, the session will consume only about eight or ten weeks, or, in other words, will close about the middle of March. Many important problems confront the incoming lawmakers. The Republican majority will get busy and enact only necessary legislation pertinent to the vital interests of the State. Among the matters that will come up early in the session of much concern to agriculturists of

New Jersey are bills providing for the payment of interest and taking care of the sinking fund for the proposed Delaware River bridge between Camden and Philadelphia and the Hudson Tunnel between Jersey City and New York, which will be of tremendous value to produce growers and farmers owning automobiles.

Medals Are Ready.—The thousands of farmers' sons in this state who entered the world war and accomplished deeds of service of many kinds are urged by Governor Edwards to make application for what are known as Victory Medals. The Governor has requested the press to inform the veterans of the great conflict to immediately become possessors of the insignia. The Executive has pointed out that applications may be made at any recruiting station, either of the army, navy or marine corps, or thru the nearest post of the American Legion. The Governor states that the men are not only earnestly requested to make application at once as a part of their duty to assist the War Department in the proper distribution of the medals but also as a matter of right and justice to themselves.—Kelly, Trenton.

Feed your crops a "balanced ration"

Increasing the yield of a crop by the use of properly "balanced" fertilizers is as natural and practical as increasing the weight of hogs and cattle or the quantity of milk from cows by means of "balanced" feeds.

You can't get maximum results from hit-or-miss methods. Big crops are principally a matter of proper "feeding". Proper feeding is a matter of proper fertilizing. And proper fertilizing is a matter of correct knowledge of soil needs for the particular crops you want to grow. "Any fertilizer" won't do. It must furnish the right food elements in the right proportions at the right time throughout the whole growing season.

Why not put your farming on an efficiency basis? Get all the profit. Write to our Agricultural Service Bureau as to the proper fertilizers for your soils and crops. This service is free to you—as a help toward bigger yields, larger income, greater happiness. Also ask us to send you our useful booklet "How to Get the Most out of Fertilizers". No charge.

If there isn't an A A C agent near you, write for the agency yourself.

FERTILIZERS

MAKES YOUR WORK GO THREE TIMES AS FAR!

ONE of the big problems of the farmer is to get his work done in something like the hours that the city man works, so he can hold his sons on the farm and keep the men he hires.

THE HUBER LIGHT FOUR cuts the labor of plowing and preparing the seed bed, and of harvesting to one-third of what it used to be and that means more leisure. It means bigger crops because the work can be done on the few choice days when the ground is just right. The LIGHT FOUR uses heavier tools and does the work more thoroughly. It is self-steering in the furrow.

The Huber Drive Wheel. Note how power is transmitted direct from the bull gear to the rim of the drive wheel of the Huber Light Four. The spokes carry weight only. They transmit no power. That means long life and perfect service. The wheels are especially high and wide of face for work on soft or uneven ground. This is only one of the many points of Huber Superiority.

But those tractor advantages are real advantages only when you can count on them with the same certainty that you used to count on the work of your horses. Thousands of power farmers have known the HUBER for years as the tractor "that always keeps going." Every part of the HUBER is as strong as every other part. And they all have been tested and tried by 20 years of tractor building experience. Every tractor is backed by a Nation-wide system of service branches.

THE HUBER LIGHT FOUR does all belt work on the farms efficiently and quickly, even to driving a light thrasher. Write for booklet—"The Foundation of Tractor Dependability."

Cost of Production

has Come Down

With prices at new low levels, it is even more important than when the "Sky was the limit" to watch cost of production and equip yourself to meet competition. You cannot produce Milk or Beef in competition with the farmer who has a silo unless you are equipped as he is.

Tectonius and Darby Silos are genuine cost production savers.

Start cutting cost by taking advantage of our JANUARY DISCOUNTS which we guarantee are as large as will be made during 1921. Write at once for illustrated catalog, prices and discounts.

GLOBE SILOS

With the Globe Silo the extension roof idea was introduced. Today it is the only extension roof with side walls so nearly straight that silage settles level—no heaped up silage exposed to the air.

Learn now the other exclusive Globe features, the special early order discounts and low live agents can obtain open, profitable territory. Send for Globe Catalog.

TALKS WITH THE BOYS

Blessings on thee! Little man—
Barefoot boy with cheeks of tan;
Why thy turned-up pantaloons
And thy merry whistled tunes;
With thy red lips—redder still;
Kissed by strawberries on the hill;
With the sunshine on thy face,
Thru thy torn brim's jaunty grace;
From my heart I give thee joy—
Blessings on thee, barefoot boy!

Introductory Letter

To the Boys:
It does not seem long since I was a boy on the farm. Yet measured by years the number is greater than I like to think. Altho times have changed a great deal in those years, I do not believe that boys have changed very much. I suspect that you are having pretty much the same joys and troubles, the same successes and disappointments that I and all other men had while boys. No doubt you are planning what you will do when you become men. It may be that some of you are saying that you will not—no, never—he farmers, while others feel sure that is the life for them. Well, we will not argue that point now. I know that there are lots and lots of things that it will do us good to talk over whether you become farmers, lawyers, doctors or barbers. So we will mark off a space here and put up this sign:

CAUTION NOTICE:
This Space is Reserved for the Boys and the Editor

I remember that in my boyhood farm home newspapers were scarce and this was the case in nearly all farm homes. There was the county paper, which did not interest me very much, and the Blade, a paper of national circulation devoted to general subjects and short stories. Besides the story which mother read aloud every week, there was a department called "Our Young Folks." In it letters from boys all over the country were printed, and it is this feature that I remember most distinctly thru all the years. Those letters were most interesting and the kind, helpful advice which the editor printed each week was most encouraging and interesting to me.

In this connection I wish to relate a little personal incident. As I remember it, I was about 12 years old when Ambition took the first good, hard crack at me. Our county paper published, one week, an advertisement for a country boy to help around the printing office and learn the trade—in other words a "printer's devil." My eye fell on this and I forthwith determined that the job was for me. The fact that a sister and I were the only children left out of a family of five (three having recently died from diphtheria) did not deter me from setting my heart on leaving father, mother and sister alone on the farm while I should go to town to work, six miles away. Youth is often thoughtless and selfish. It does not really mean to be, but when it sets its heart on a thing, that is the only thing worth while—or so it seems at the time.

Well, father put his foot down on my scheme and smashed it. Mother sided with him. Sister sympathized with me but could not help me any, and I tearfully concluded that I was a badly used boy. Did you ever feel

that way when you could not do what you wished?

I poured my sorrowful tale into a letter and sent it to the editor of the boys' department of the Blade. That sensible man gave me some plain, straight talk, but did it so nicely that I felt more kindly towards father and mother and very soon realized that their advice was for my own good, as it always was.

Now, boys, I propose to set aside this corner just for you and me. Older folks and girls shall not put a foot into our den. They may have their own, but here you and I are going to meet weekly and talk over things that puzzle us, and tell about things we do or would like to do, and advise each other about things we would like to know.

Of course, the success of the department will depend upon whether you write me or not. You need not fear to tell me anything that is on your minds, as I know how to keep secrets. I was a teacher for a good many years and nothing gives me greater pleasure than to remember the close companionships I formed with boys. Just write your thoughts and mail the letter to Editor, Pennsylvania Farmer, 261 S. Third St., Philadelphia, Pa.

I feel sure that we can soon develop a department that will be valuable to all of us. We will not limit the field of discussion. Before we are thru we will likely be discussing education, amusements, farming, religion, politics, business—oh, well, there is no limit. Boys, "are you on?"

*Sincerely,
The Editor*

FIGHT BETWEEN TWO MOUNTAIN RAMS

"The mating season of the mountain sheep is in November and December, but prior to the opening of this season the old rams that have lived so peaceably together during the summer begin to spar and fight among themselves," writes Charles L. Smith in an article on "The Rocky Mountain Sheep" in the November issue of Boys' Life. Their battles, however, are of short duration and are more in the spirit of fun than otherwise, but as the season advances they become more frequent and severe. Each ram seems to know that if he is to stand any show with the herd, he must prepare in advance the muscles of his neck and shoulders and the cushion on the back of his skull, just back of the horns, in order to stand the mighty shock of some future adversary.

"I lay all one day in a cave in the rocks in the mountains of British Columbia and watched a fight between two of these old mountain monarchs. I saw them strike hundreds of blows, any one of which seemed to me was sufficient to break the neck of his adversary. The mountain sheep's instinct for developing the muscles for offensive and defensive warfare, is such that if it has not a companion who is willing to stage a sham battle for this purpose it will deliberately back up and charge a tree. Many of these trees can be found near timber line in the sheep country. The marks resemble two blazes with a strip of green bark between. These trees are struck with sufficient force to beat the bark off down to the wood.

PASSING EVENTS IN PICTURES

- 1—No One Could Resist the Smile of Little Howson Hartley, of Brooklyn, N. Y.
- 2—"The Shepherds of Bethlehem," from an old painting.
- 3—Little Miss Dolly Dupuy, in Her Latest French Costume.

My Musical Medicine Chest

OUR musical medicine is mainly for those who don't want to get sick; but we even have the kind of melodies to cure almost any malady one can find in the dictionary.

Most ailments come from a state of mind, when it is out of gear. Most ladies living in the same atmosphere, with the self-same things happening regularly year after year, get a little bored. They want entertainment. But they can't go running after the big city theatres. Anyway, why should they? That's not necessary at all.

But still, when the day is coming to a close, and the blank walls face you, what are you going to do? There's where most ailments start, right there and then.

So this very night, or the very first night you can try it, open up the musical medicine chest. Take out a phonograph record, or go to the piano, or just think of an old song. Take a goodly dose of music. Put yourself in the spirit of the idea.

Entrance to a Farm Homestead in Monmouth County

Forget everything else, and just float off on the wings of music.

Ah, I have met farmer folk who laughed when we talked such nonsense. But you ought to see them now! It would do your heart good to realize the complete enjoyment night after night they find in the musical medicine chest.

Why, if it's raining, they put on sunny music, such as "The Spring Song" of Mendelssohn, or "The Moonlight Sonata" of Beethoven or a Hungarian Dance of Brahms. And if it's a cold night, and everybody's shivering, they try "Rustles of Spring" of Sinding, and the "Pastoral" of Mozart. They've learned how to find the hidden meanings in the chords of music. For here is a secret—the big idea which makes music more important to you than you ever dreamed before.

When some chords sound they seem like messengers of tragic drama; when some notes sing they are like the voices of angelic heralds of hope; when some phrases are heard the blood flows faster, the heart leaps, the whole body feels imbued with the shock of new energy. If you can understand this next sentence, you know more about great music and its power than many musicians.

Just as food tastes well, but must perform its mission of nourishing, so the pleasantness of sound in music is only the first part of its value; the revitalizing, inspiring, improving, developing qualities are far more important.

While you're being entertained, good music does more for you. Like the spring sun, which wakens the vegetation, the music calls into being the impulses of your youth and your gayest memories. It acts like an electric battery in refurnishing your nervous system with energy.

When you are tired, just too tired to sleep, when your every nerve is tingling and you feel like crying out, if you might listen to the soft crooning of a cello or a violin in the beautiful "Swan" music of Saint-Saens, how the notes would soothe your brow and how your body would calm into a perfect quiet, devoid of all restless sensations. When you feel a melancholy creeping over you, how inspiring and arousing are the brilliant rhapsodies of Liszt, the mazurkas of Chopin, the operatic arias of Verdi.

In my medicine chest of music, I have a prescription of every kind for woman and man of every disposition, in every emergency and in every situation. For the holidays, there are musical compositions which fit ideally; Christmas and Easter have their perfect musical dress; birthdays and wedding anniversaries and little social gatherings, and the period after a mourning, and the period after a birth—when you know them, you can pick your music as you do your foods.

The man of the house will appreciate the wife who introduces the beauties and advantages of music to the farm; after he has once tasted of the invigorating influence of all the great masters of harmony, he will realize that prohibition has created a finer agency for the entertainment of all mankind, by the fact that it has drawn new attention to the harmless, beneficial habit of listening to good music.—Chas. D. Isaacson.

THE CHARM OF HOSPITALITY

Think of the homes you visit, and the homes where you casually call. Is not there something about many

of them that gives you a warm, comfortable feeling of being genuinely welcomed and wanted? What is that evanescent "something"? It is the cordial hospitality of the person on whom you are calling; or visiting.

And are there not other homes where the hostess has not learned the charm of hospitality? Where she accepts your visits in a good deal the same spirit as the grocer, the baker, the candle-stick maker?

Not that you expect any great celebration. Not that at all! But it does warm the cockles of your heart to see a large welcome, not on the doormat, but on the faces of your friends, and feel a good, hearty handshake and hear their urging you to come again, soon!

Everybody hates being taken for granted, I think. It usually takes time and effort getting ready to make a call. And it seems like a small thing, but it often means a sacrifice for the very busy woman.

Of course there is such a thing as over-doing, and over-entertaining the guest.

A house guest should be given some time to herself, for reading, writing letters and relaxation. Hospitality does not mean filling in every minute, whether to the guest's liking or no.

It is a good idea, before making up the day's program, to consult the guest. You may have arranged for a table of bridge; and your guest may have a scarlet loathing for cards. She may prefer a tramp in the woods.

And the friends who drop in. Do not hesitate to ask them for lunch or dinner, because the larder is not groaning with good things. It is a common saying that strange cooking delights the palate. You may have planned very simple fare; but the mere fact that you feel the guest a comfortable person of whom you do not make "company" is a compliment in itself.

So let us all not forget the value of—true hospitality!—Helen Grigg Green.

THE FARMHOUSE KITCHEN

During the winter, many a farmhouse kitchen is called upon to do duty as a living room. There are assembled the most comfortable chairs, the dependable clock, the best light and oftentimes, the long settee. The winter evenings start early and around the evening lamp on the kitchen table are spent the restful hours well earned after the hard work of spring, summer and fall.

Why not start the winter off right by making the kitchen a more attractive place both day and night? With a little careful planning and the expenditure of little money. This important room can be made well worthy of the constant use to which it is put. There are paints for the walls, which will make a remarkable difference in the light of the room, varnishes which reflect and increase the cheerfulness of a none-too-strong winter sun, and lighten the dull places, and at the same time protect the wood beneath from warping, from dampness and from weather changes. In winter, the floor whether of wood or linoleum, needs surface protection more than at any other season from tracked-in mud and snow.

Even the most old-fashioned kitchen, if its walls, floors, window frames, doors and cupboard doors are painted or varnished, will be a pleasant workshop for the farmers' wife, a cheerful dining room and a comfortable center of the home. For a few dollars, and very little trouble the kit-

chen can be made a place of beauty. Winter is the time to brighten interiors.

TAKE TIME FOR THE LITTLE ONES

Don't be too busy in these strenuous, hustling days, to take the time once in awhile to cuddle the little folks. How prone we are to think this thing and that thing must be done, the children can wait, and the first thing we know they are too big to cuddle! If we put everything else ahead of them and their wants while they are too small to help themselves, can we expect them to have very much time for us when we are old?

I am a widow with a little daughter of seven, my mother is entirely helpless, and I am teaching. It will be self-evident that I am a busy woman, but the little girl is unusually susceptible to scolding and fond of being petted—probably because her father died before she had a chance to know him, and I have always had to take the place of both parents—and I have never yet refused to give her a cuddle when she wants it, unless under stress of rare emergencies and at such a time she usually has better sense than to ask. Tonight I was sewing and was extremely busy but the girl has a bad cold and was coughing so much of the time it made her more "fussy" than usual so I took the time to rock her for a few minutes before a cozy fire and I don't think it was a waste in any sense whatever.

Once when she was a tiny baby she cried frantically for a long time one evening. It was evident that she was crying from pain, not temper, and I had no idea what might be the trouble. I sent for my neighbor and also for the doctor, but by the time the doctor arrived she was quieter and he said she had probably had an attack of colic. We called it a joke and of course calling a physician was very foolish but I have never been sorry (though if it had occurred more than once the condition of my purse would probably have made me sorry.) I surely prefer thinking that I paid for one very unnecessary call, rather than to have to think I saved the price of a call and lost my girl.

How often we hear little ones pleading "Mamma, take me," and the busy mother says "Run and play, I haven't time." Would we say it if we stopped to think that we won't always have them? And if nothing worse happens they will soon grow up. I rarely ever go anywhere and leave my small daughter. She likes to take all trips as well as I do and often the business trip for me is a holiday for her. This fall she was "crazy" to go beaching so I took an hour out of two busy Saturdays to go with her. Foolish? Perhaps, but much more frivolous foolishness can be and often is, indulged in by mothers of small girls.

Just at present the storm is howling outside and she says "I'm lonely tonight, Mamma, aren't we going to bed soon?" I told her "Yes, very soon" and we are for, after all, what could be more important than just keeping faith with these little ones? As they grow up they must know that what mother says is true and can be depended upon every time.

It's a saving of fuel, when cooking certain foods, to prepare enough to use for two meals. It need not be served in the same fashion each time.

PENNSYLVANIA FARMER PATTERNS
Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3165.—Nightie for Kiddie.—The pattern is cut in 5 sizes: 1, 2, 3, 4 and 5 years. A 4-year size will require 3 1/2 yards of 27-inch material. Pattern, 10 cents.

3088.—Combination for Girls.—The pattern includes all styles illustrated. It is cut in 6 sizes: 2, 4, 6, 8, 10 and 12 years. The drawers require 1 1/2 yard of 36-inch material, the petticoat 1 1/2 yard, and the undershirt 1 1/2 yard for a 10-year size. Pattern, 10 cents.

2484.—A Pretty Slip-on Night-dress.—The gown may be finished with openings at the shoulders if the slip-on style is not preferred. The pattern is cut in 4 sizes: Small, 32-34; medium, 36-38; large, 40-42; extra large, 44-46 inches bust measure. Size medium requires 7 1/2 yards of 27-inch material. Pattern, 10 cents.

3079.—Pajamas for Ladies.—The blouse is made in slip-on style. The bloomers may be finished with loose or gathered lower edge. The ruffle below the garters could be omitted. This pattern is cut in 4 sizes: Small, 32-34; medium, 36-38; large, 40-42; extra large, 44-46 inches bust measure. Size medium will require 4 1/2 yards or 36-inch material. Pattern, 10 cents.

HOMESPUN YARN

If you saved the paraffine from last year's jelly, washed it and stored it away in the cupboard you made a worth-while saving in this year's jelly-making.

Meat canning time is here. Many housewives would as much think of failing to have a good supply of canned fruit as to be without canned meat.

The A. B. C. of household arrangement: Place the necessary furniture within a given space in a way that will be reasonable for use and pleasant to see.

Do the children have a weekly allowance of spending money, or is it a nickel now, a dime then, and a quarter some other time, the total of which neither child nor parent can even guess?

The State of California

Makes You This Bargain Offer

The State Land Settlement Board of California will sell bona fide homeseekers an irrigated farm of 20 or 40 acres in San Joaquin Valley, with 36 1/2 years time for deferred payments

These farms are in Farm Land Unit No. 3, consisting of 1540 acres in Merced County, the heart of the famous San Joaquin Valley, and will be offered to bona fide homeseekers.

These carefully selected lands were acquired by the State of California for settlement purposes. A complete irrigation system is being installed. Price per acre varies according to location. Five per cent of purchase price payable when deal is made; remaining over a period of 36 1/2 years, with interest at 5 per cent per annum.

When this unit is exhausted, other similar tracts will be opened up as rapidly as land can be prepared for the new settler.

An unusual opportunity to acquire a small ranch in winterless California, at a minimum cash outlay.

All deciduous fruits are profitably grown, and alfalfa is a paying crop. Ideal conditions for stock and poultry. You have benefits of

established communities. Schools are ready, and fine roads. The various fruit associations have a remarkable marketing system. You raise the fruit; no bother about markets.

The Santa Fe operates five trains a day from Chicago and Kansas City to California. Two of them—the California Limited and the San Francisco Limited—are solid Pullman trains with dining cars all the way.

The Navajo, Scout, and Missionary carry standard and tourist sleepers and chair cars; meals in dining cars east of Kansas City and at station dining rooms west. Meal service for all trains by Fred Harvey. The California Limited and the Missionary have through sleepers by way of Grand Canyon of Arizona.

The Santa Fe tourist sleepers are comfortable, and you save about half the berth rate. Station meals also are economical—a "square meal" for a dollar.

You Can Farm All Year in California

The State Board's booklet about these lands and plans for financing improvements, Santa Fe illustrated folders descriptive of San Joaquin Valley and the trip there, mailed on request.

Let me help you plan your trip.
C. L. Seagraves, Supervisor of Agriculture, Atchison, Topeka & Santa Fe Ry., 932 Railway Exchange, Chicago.

HOW I RAISED MY PIG

On the 24th day of May, Mr. Brinton took me to look at some pigs and papa bought me one; I named it Polly and on the second of June I weighed it and it weighed fifty-five pounds.

Papa bought me a movable pig-pen, which seemed to be a great help as she always had a clean bed and green grass; until August I fed her three times a day on middlings, hom-

Mary McMullin and Her Pig

iny and tankage, but on account of the heat I thought it better to feed her but twice a day. I scrubbed her once a week, but she became too heavy for me to handle and now takes a mud bath.

Polly is fond of Seckel pears and I have enjoyed raising her very much as I had no idea what a pet could be made of a pig.

Mary McMullin,

Member of Brandywine Pig Club (1920).

HOW I RAISED TOPSY

On June 2nd I bought Topsy from my father for seven dollars and she weighed 45 lbs. On June 27th I penned Topsy in a small place, and then fed Topsy two parts cornmeal, two parts middlings and one part tankage, mixed with about one-part skimmed milk, every night and morning. I washed Topsy three times daily and she seemed to enjoy it, but I found that she was not getting enough feed so I increased the rations every day.

Frances Darlington and Topsy

This picture was taken July 27th, and Topsy seemed to enjoy being snapped as she stood still; on July 8th I weighed Topsy by measure, as this was much easier than putting her in a bag, and she weighed 112 lbs. and until Sept. 1st, I fed just good sense not to use any paint at middlings, tankage and milk; I kept all the neighbor women think she salt and water in the pen all the time. From Sept. 15th I fed about State Journal.

one bushel of new corn, which she seemed to enjoy and on October 12th, she weighed 217 lbs.

I had spent 34½ hours and she cost me \$26.50 and the day we had our roundup I sold her dressed for \$40. —Frances Darlington.

FARM BUREAUS IN DELAWARE

The third annual meeting of the Sussex County Farm Bureau was held Thursday, Dec. 2, at the Court House in Georgetown.

Dean and Director C. A. McCue, of the School of Agriculture; Mr. M. O. Pence, State County Agent Leader; Mr. Theodore T. Martin, State Boys and Girls' Club Agent; Miss Kathryn Woods, newly appointed Home Demonstration Agent for the State at large; Mr. M. C. Vaughn, County Agent, and Miss Dorothy Emerson, Boys and Girls' Club Agent, met with the executive committee, and a good representative crowd of men and women of Sussex County Farm Bureau Members, at morning and afternoon sessions.

The morning session was taken up with the committee meetings and reports of this year's Farm Bureau activities. Miss Dorothy Emerson, County Club Agent, reported that 32 boys and girls' club had been organized this year in Sussex County and the exhibit of canned fruits, garments, etc., showed that these clubs had been doing excellent work.

Mr. M. C. Vaughn, County Agent, discussed the following Farm Bureau projects, which have been very popular with the farmers and the furtherance of which has greatly benefited them: Sweet potato seed treatment; hog cholera; better plant project; poultry culling; soy beans; soil fertility; co-operative marketing; wilt resistant tomato seed; corn shows, permanent pasture; clover seed harvester demonstration; cow testing; drainage. The recommendation of Mr. Vaughn, that several of these projects be continued during the ensuing year, was acted on favorably by the program of Work Committee.

Mr. Thomas N. Rawlins, of Seaford, chairman of the Expense Budget Committee, recommended that the Farm Bureau budget for the coming year be increased \$1600 in order to more adequately provide for the growing needs of the Farm Bureau.

Albert M. Tarr, of Seaford, chairman of the Membership committee, recommended that the Farm Bureau membership fee be five dollars per family—to include children between the ages of ten and twenty-one years. Three dollars of this fee will be paid to the state and National Farm Bureau Federation and the remainder will be retained by the County Bureau.

The question of forming a State Farm Bureau Federation was discussed. Mr. Cosden stressed the necessity of the three counties of this state forming a State Federation, and stated that both New Castle and Kent County Farm Bureaus had already decided to federate.

Mr. Brooks L. Ross, of Seaford, president of the Seaford Produce Growers' Association, Inc., showed the need of a strong national farmers' organization.

What They Think

When a young woman has the good sense not to use any paint at middlings, tankage and milk; I kept all the neighbor women think she salt and water in the pen all the time. From Sept. 15th I fed about State Journal.

Neighborly Talks

THE STRENUOUS NEIGHBOR

There are not hours enough in the day for the strenuous neighbor. He works early and late. He takes time by the forelock and rides in the saddle all day. The supreme end of life for him seems to be work. If he is a day behind in his planting he makes life a burden for his family and for the hired man. His hired man is usually halter-broken, and leads well, but he objects to being driven. Help never sticks to him as it does to his winsome neighbor.

The strenuous neighbor cannot be strenuous moderately. He gets his potatoes in too early and the frost nips off the tender shoots as they spring from the ground. He overloads his wagon and the village blacksmith gets a job, for the wagon breaks down. He works his horses too hard and they give out. He lengths his days and shortens his life by burning too much oil in the lantern. He never has time for recreation. He has forgotten that recreation recreates. He forgets that a candle burned at both ends flickers out in the middle. Ambition is excellent in its place—it makes an excellent condiment but is hardly suitable for a full meal.

A strange blindness often affects the strenuous man. He becomes blind to the beauties of nature; to the charms of the wild flowers that life up their delicate faces to him; to the glory to the sunrise, to the charms of the clouds that once seemed to him "Argosies that sail the azure sky." He even becomes deaf to the songs of the birds, and has ears only for some strenuous hen who loudly boasts of an egg, fresh-laid, or eyes for the wheat or corn or products of his labors.

The strenuous neighbor misses too much of life's sunshine. He should stop occasionally, and rub his eyes for a moment, and realize the truth of these words of the poet: "Tis a goodly, pleasant world that we mortals journey thru."

And our Father's constant blessings fall around us like the dew. Now it is better to be strenuous than to be indolent, but it is hard to keep a whole harness on a strenuous horse, and a man who is too strenuous often works more comfortably in single than in double harness. He is always breaking something—possibly a record.

But, after all, the strenuous man is an inspiration to some of us who are naturally indolent, and who have an affinity for a rocker and a newspaper just at the time when crops are begging, in their dumb, voiceless way, for our attention. Possibly it may be beneficial for us to rub up against the strenuous neighbor occasionally.

Don't fool yourself that So-and-So has everything he wants. Do you imagine that he doesn't know how you and other people regard him? And do not think for a moment that he enjoys being looked at askance, or that he wouldn't exchange most of his ill-gotten gains to stand high with you and other people—and to stand high with himself.

The Sixth Annual NATIONAL TRACTOR SHOW And Educational Exposition

THIS is your show. It has been planned in the interests of all practical farmers. It has the backing of the Department of Agriculture and of all agricultural schools and authorities. The program arranged is the equivalent of a college course in tractor farming. You will gain a wealth of new ideas that can at once be turned to real profit. Plan now to come.

A College Course in Tractor Farming

Compressed into Four Days

Few men can picture, even in their own minds, the tremendous growth of power farming. Rapidly it is changing many of the established laws and methods of agriculture. Certainly today it is the foremost of all great opportunities confronting the farmer in his work. You will get real cash-value information out of these lectures, speeches and exhibits. The talks will be delivered in a special lecture hall and the program also includes daily discussions, mass meetings, band concerts, etc. Everyone who attends will have a good time and a profitable one.

National figures like Pres. Elect Harding, Sec. of Agriculture Meredith, J. R. Howard, Pres. American Farm Bureau Federation, Joseph Hirsch, Chairman Agriculture Commission, American Bankers Association, and others have been invited to speak. The American Societies of Automotive Engineers and Agricultural Engineers and a number of the foremost Agricultural Colleges will have educational exhibits. And don't forget that all of this is in addition to the biggest display of tractors and tractor implements that has ever been gathered.

COLUMBUS OHIO Feb. 7-8-9-10-11 and 12

Eight huge buildings belonging to the state of Ohio—modern, fireproof, well lighted, scientifically heated and connected with one another by covered passageways—will house this show. Every arrangement has been made for the comfort and convenience of those who attend. Write today for special free tickets of admission. Ask for our booklet explaining the entire program. A hundred thousand farmers will be here to meet the power farming experts of the country.

National Tractor Show Committee, Columbus, Ohio

A Natco Silo

Costs a Little More—
Lasts a LOT Longer

It does cost more to build with everlasting Natco Hollow Tile than with materials that soon decay, but it's far cheaper in the long run. A Natco Silo will not rot, burn, burst or blow down. It has no hoops to tighten, needs no painting and seldom any repairs. You can pass a Natco Silo to your children practically as good as new. On the farm will bring more should you wish to sell.

Farmers who figure costs closely are using Natco Hollow Tile for silos, dairy barns, hog houses, dwellings, etc. Our book "Natco on the Farm" describes and pictures many such uses. Send for it today—no charge. Ask your building supply dealer to quote you on Natco Hollow Tile.

500-Shot "Daisy" Air Rifle

We will send this Air Rifle, all charges prepaid, for 5 yearly subscriptions at 75 cents each; or with a single subscription and \$2.00 extra. The Daisy Air Rifle is a repeater, lever action, magazine holds 500 light rifle shot. Automatic retainer prevents shot from rolling out of barrel. 31½ inches long. Nickel plated barrel, walnut stock. An ideal rifle for target practice.

PENNSYLVANIA FARMER, 261 South Third Street, Phila., Pa.

Please Mention Pennsylvania Farmer When Writing to Advertisers

COUNTY NOTES

Lebanon County, Pa.—Mild and pleasant weather has prevailed so far this autumn. The general opinion of a local weather prophet is that the winter will be quite mild and open. All corn is husked and in the crib. Butchering is the order of the day now with our folks. We had a large apple harvest this autumn and much cider and apple butter were made. Tobacco stripping will soon start. Farmers are much concerned over the great drop in prices of farm produce and production will undoubtedly be curtailed the coming season. The local granges are very active and influential in membership and influence.—Leonard F. Strickler.

Blair Co., Pa.—We are having fine weather, we also had a green Christmas. The low price wave has hit this section of the county all right. Shredding stover, sawing wood and winding up threshing have been the jobs done lately. Some sod was plowed the past few weeks and manure has been hauled from yards for next year's corn crop. Owing to the unsettled milk situation, with no market for whole milk, more farmers are feeding steers than usual to turn the big corn crop into money. This county had a good fair in October, but the expenses were so heavy that no money was made. Frank Printzenhoff sold his farm of 160 acres in Kelly township for \$20,000 to a man from Pottsgrove. Three new state banks of \$25,000 capital each were organized in the county in 1920, and they are all doing some business. The annual meeting of the farm bureau will be held on the 15th of January when a paid membership will be fully discussed, and a corn exhibit will be made. Prices: Wheat, \$1.75; corn, 75c; oats, 60c; veal calves, 13c; pork, 15c; butter, 56c; eggs, 78c; chickens, 22c. The Pennsylvania Farmer is one of the farm papers which favors the interests of the producer at all times, and works for the best in country life on the farm and in the home. May 1921 be a good year for them in their business.—J. N. Glover.

Union Co., Pa.—The open weather has enabled farmers to finish husking corn and to store the stover, both of which were very good. Shredding stover, sawing wood and winding up threshing have been the jobs done lately. Some sod was plowed the past few weeks and manure has been hauled from yards for next year's corn crop. Owing to the unsettled milk situation, with no market for whole milk, more farmers are feeding steers than usual to turn the big corn crop into money. This county had a good fair in October, but the expenses were so heavy that no money was made. Frank Printzenhoff sold his farm of 160 acres in Kelly township for \$20,000 to a man from Pottsgrove. Three new state banks of \$25,000 capital each were organized in the county in 1920, and they are all doing some business. The annual meeting of the farm bureau will be held on the 15th of January when a paid membership will be fully discussed, and a corn exhibit will be made. Prices: Wheat, \$1.75; corn, 75c; oats, 60c; veal calves, 13c; pork, 15c; butter, 56c; eggs, 78c; chickens, 22c. The Pennsylvania Farmer is one of the farm papers which favors the interests of the producer at all times, and works for the best in country life on the farm and in the home. May 1921 be a good year for them in their business.—J. N. Glover.

Cumberland Co., N. J.—A two-day farmers' institute was held in the agricultural department of the Shiloh High School in December. There were 36 agricultural boys present with the farmers of the surrounding country. M. Robert Trimmell, was moderator for the meetings. The speakers were H. R. Cox, State College of Agriculture; Gilbert Barton, Woodstown, a practical farmer; Fred Gardner, Robbinsville; B. S. Ellis, Vineland, a successful poultry man; A. R. Kohler, Westville; H. E. Taylor, president N. J. Council of County Boards of Agriculture; Walter Minch, Bridgeton, and Mrs. Helen Minch App, of New Brunswick. The evening entertainment was given in the school auditorium by Mrs. Rose Morgan with her "Songs That Live."

A WINTER WHEELBARROW

A very handy implement for winnowing where there is much snow.

It is made just like an ordinary wheelbarrow except that a single runner is used instead of a wheel. The frame should be made and the axle attached to the same as for a wheel, but the axle should be square instead of round. Into the center of the axle mortise a piece of tough wood 2 inch square and about 1 ft. long. To the lower end of this upright the runner is attached. The runner should be 2½ or 3 ft. long and thoroly braced to the upright. The runner must come up higher in front than for a hand sled so it will push easily thru deep snow and over uneven surfaces. This is better than a hand sled, as it can be used on sliding ground or in a narrow footpath where a sled with two runners could not be used at all. A still better way is to have one of these runners made to fit the ordinary wheelbarrow, then by removing one iron where the axle is attached to the side-arm it can be changed in a few minutes from wheel to runner or vice versa, thus avoiding the expense of an extra barrow for winter use, and also saving storage.

TIME TO MOVE

Many young married people have enough of sentiment about them to wish to remain all their lives on one farm, whether they build a new house or not, and in many instances farmers and their wives can do no better than to remain on one farm indefinitely, but there are cases when moving is the only safe and sensible thing to do. Particularly is an inherited farm regarded with peculiar and tender feelings, and often the couple who dwell there think that nothing but bad luck will follow them if they forsake "the inheritance of their fathers." But take the case of the young man who outgrows his farm and can buy nothing near at hand. Should he handicap himself and his family on a little place when he has the capacity for greater things? Most certainly not! Keep the little place if sentiment dictates, but he should not lose opportunities simply because his ancestors owned the farm, or because he and his young wife began house-keeping there.

Then there is the case of the house where some tragedy has occurred. The death of some beloved child, a suicide, a murder, a shocking accident, long illness or some cause makes the wife and mother dissatisfied and restless, but the husband and father feels sure that everything will come right in time. Not being the woman, a farmer cannot understand how the stillness, the sight of the spot where the tragedy occurred, the familiar rooms and all the surroundings bring back the pain and sorrow to the heart of the one who must spend most of her days indoors. One man who sacrificed a fine farm for a poor one because of a tragedy was thought to be very foolish by his friends and relatives, but he knew his wife's reason and happiness depended upon the change. Another farmer who laughed at his wife's apprehensions and trusted to time to bring about a change, found to his dismay that nervousness and brooding caused by living in a haunted house, sent her to a sanitarium, and that a timely move might have saved it all.—Hilda Richmond.

We're hoping the New Year will bring peace, happiness and prosperity to all.

FRANCE RESTORES WAR REGION FARMS

Sixteen thousand square miles of ruined fields, an area of desolation equal to the states of Rhode Island, Connecticut, the southeastern corner of New York and all of New Jersey, was the war's legacy to the farmers of France. This stretch of agricultural territory had previously yielded a living to some 2,700,000 people and was ranged over by flocks and herds numbering more than 1,000,000 head of cattle, sheep and goats.

Armistice Day, 1918, saw this territory reduced largely to a sterile and trackless waste. Dispersed beyond official reckoning were its inhabitants and their possessions. Wiltedness of the war's desolation in these regions were hopeless of restoring the country.

But what then seemed impossible has taken place. The great war desert of France has since been made to bloom. More than 2,000,000 of the population driven from their homesteads by enemy invasion are back to native boundaries. Save only in a few regions where a thin top soil utterly vanished before the blast of war, the countryside has become productive; in some places even more productive than before it was ravaged.

This picture of agricultural restoration in France is drawn from official statistics of the restoration accomplished between the end of the fighting and Armistice Day, 1920. In these two years, according to returns made to the French Commission in the United States, the devastated regions have been nursed back from absolute barrenness to a productivity sufficient to feed the repatriated people.

Some conception of the work that was necessary to bring about this result is afforded by official figures of the Committee for the Devastated Regions. Gun fire had sown the torn-up battlefields thick with shells and other projectiles. The task here was to harvest this perilous crop from 16,000 square miles of France. It was accomplished by April 1 last.

The territory ranged over by the fighting armies was encumbered by thousands of tons of barbed wire entanglements. Then thousand square miles of territory thus encumbered was also cleared by April 1. Perhaps the largest ploughing operation in the history of the world was proceeding in the wake of this harvesting of steel. It involved the furrowing of almost 6000 square miles of French soil to permit of first sowing. And while the plough shares were combing desolated France back to productivity, 178,500 houses were repaired, 46,570 temporary homes were built and 13,100 damaged dwellings were restored.

This was the preliminary work accomplished early in the present year which made possible the later achievement in food production. One of the impressive evidences of this production is the huge stacks of unthreshed grain now dotting the fields which only a few months ago were bare like lava beds than farm land. Intense effort on the part of the returned peasantry aided by a good season has, according to official reports of the office of Agricultural Reconstruction, insured larger than pre-war crops in many sections of the invaded territory.

Estimates are that this year's cereal crops—wheat, barley, rye and oats—will be 11,578,000 quintals (220½ pounds to the quintal) compared to 20,500,000 quintals produced before the war. The beet and potato crops will total almost 20 million quintals or 25 per cent above pre-war production. The total agricultural production exceeds that of pre-war days.

The five departments of the Aisne, Nord, Oise, Pas de Calais, and Somme, favored by mild climate and the quality of their soil are foremost in the present year's production.

PENNSYLVANIA'S FORESTS

For several months past I have had the pleasure of talking occasionally with the readers of Pennsylvania Farmer. I am sure these little talks have helped to bring the story of Pennsylvania's forests close to the minds and hearts of the people of the Commonwealth, because they have brought me many letters from all sections. And each of these letters shows interest. They prove that the people of the state appreciate the needs of the state along forest lines.

Many people have asked me to summarize the forest needs of the state. I am therefore glad to submit the following:

First.

We must stop the forest fires. But we cannot stop fires without money. For that reason we must have the appropriations necessary to give effective protection against fire in the woods. We ought to have a million dollars for the years of 1921-22. This will mean but four and one-half cents to protect each acre now owned by the state (to say nothing of the private lands which must be protected also) and this amount per acre will be reduced with each new acre purchased.

The money available this year for fire protection amounts to but four and a half mills—mills, not cents—per acre. That is not sufficient to do the work. What we shall ask of the Legislature is little enough. This money will be spent for many permanent improvements, such as fire towers, fire trails and roads, and the establishment of communication systems. This appropriation for fire protection, therefore, is the first of our forest needs.

Second. We must set our devastated lands at work again growing trees. Therefore we must have legislation, in conjunction with Federal legislation, which will effectively check wasteful lumbering and all forms of forest devastation. This applies to all forest lands, including state forests and private timber tracts, but not to woodlots on farms.

Third. We must have more state forests, and to buy them we must have money. Just how much money the Legislature will be asked to appropriate for this purpose depends upon the revenues of the Commonwealth as reported to the Legislature by the Auditor-General. Every cent we can get will be none too much. The Commonwealth must add to its forest holdings, for no other forest lands are permanently safe. There are 5,000,000 additional acres in Pennsylvania which the state should own. It can make no better investment.

Finally, our great need is the patriotic interest and support of all the people of the Commonwealth.—Gifford Pinchot, State Forester.

Money-Saving Pointers on Wall Papering

There are certain points to be remembered in hanging wall paper if best results are to be obtained.
You would know the easiest way of removing the old paper; how to prepare the walls with the right kind of paper; how to hang the paper; how to match strips; how to hang the paper; and how much paper to order.

All these important points are now explained in an interesting book which the Charles Williams Store, Inc., are now offering at a special price. The book also contains over 100 of the latest and most attractive wall paper patterns, many of which are offered at prices far below the ordinary. Anyone who obtains this book will simply add a few cents to the Charles Williams Store, Dept. 78, New York City.

CLOTHES, WOOL AND SHODDY

An appeal of the National Sheep and Wool Bureau of America ought to receive an interested hearing. It is for stamped and branded fabrics. If a garment is made of fresh "virgin wool" it should be known. If it is of "shoddy" that, too, should be known.

There has been a lack of sincerity thrust into the time honored phrase "all wool." "All wool" once meant clean, new carded and spun wool. It has come to mean any kind of cloth made of any kind of wool. By "any kind of wool" is meant made-over rags. Worn out and castoff clothing is run thru the mill and made into cloth again. Garment buyers are paying top prices for shoddy.

Clothing manufacturers are at the mercy of the insincere fabric makers. They have no means of knowing that the cloth they buy in good

growers' associations, 25 on Nov. 18 had been supplied with wool sacks and shipping directions for sending their wools to the G. L. F. Warehouse at Syracuse. The total amount of wool expected from these counties will exceed the 500,000 minimum estimated that the marketing committee estimated that it would receive. This leaves five counties to be heard from. It is generally known that early in the spring five counties sold their wools or contracted to do so; therefore the wool from these five counties can not be consigned to the state warehouse. These county associations are the Washington-Rensselaer, Orleans, Monroe, Yates and Schuyler. However from some of these counties, small carloads of wool are being picked up and consigned to the state pool.

These wools are being graded and put into shape for sale. It is doubtful if the wool market will show any

Champion Shropshire Ewe, Ohio State Fair

faith as all wool is only all shoddy or at least 80 per cent shoddy. The purchaser of a suit cannot know that he is wearing cloth that has been worn many times before.

The wool raisers ask the right to use a label or hallmark that shall distinguish virgin wool from the shoddy. They ask that the marking be of such a character that the virgin wool may be known in every stage of the manufacturing process. Thus the manufacturers may know what he is buying and offering the retailer, the retailer may be able to guarantee his wares, and the consumer can be assured of the character of his purchase.

There is no assault upon the manufacturers of shoddy. Purchasers who want shoddy may have it. If virgin wool is branded the shoddy can be known because it is unstamped. Shoddy nowadays is fetching all-wool prices. It should fetch shoddy prices.

We have pure food regulations. Why not pure fabrics laws?—Chicago Tribune.

WOOL GROWERS RESPOND TO POOL PLAN

The wool-growers of New York feel they have reason to be proud of their ability to organize thru their state federation a plan for warehousing, grading and selling their wool pools. Out of the 35 county wool

activity before March or April. Meanwhile, the national fleece wool growers' association is planning to ask Congress, at its December session, to re-enact immediately the old tariff schedules on wool. It is well-known that wool has been allowed to enter the United States duty free for the past eight or nine years. Every county sheep association should help this plan along.—F. E. Robertson.

WHAT A HORSE EATS

From cost account studies made on 38 profitable New York farms in 1919, the State College of Agriculture found that the average horse ate in one year 6769 pounds of hay and 2804 pounds of grain.

One farmer was able to get his horses thru the winter of as little as 3125 pounds of hay but fed 4776 pounds of grain. One farmer fed only 770 pounds of grain in a year but fed 10,811 pounds of hay. The farmers who fed the smallest amount of grain per horse fed an exceptionally large amount of hay. The farmers who fed the smallest amounts of hay per horse fed an exceptionally large amount of grain.

Many western New York farmers have found that by roughing their horses thru the winter around a straw stack and feeding a very moderate amount of grain they can get their horses thru in good condition.

2871, 2872

You Can Cut Barn Work in Half

In the barns that are James equipped, the increasing cost and scarcity of labor is much less a problem; for James Equipment makes barn work easy.

James Equipment not only cuts labor in two, but makes it possible for children to do work that without James labor-saving devices would require a man's strength; chore time becomes almost play time for boys who work in the barn.

Cleaning The Barn

The easy running James Carriers turn the disagreeable, dirty task of cleaning out the barn into a near-pleasure. They make a boy's job of what used to be shirked by all—and are an investment that pay profits of 25% or more a year in labor saved.

James Scrapers make quick work of cleaning cement floors; the James Stanchions, with the James Alignment Device, keep the stalls and cows clean, by aligning the cows at the rear, so that manure falls in the gutter and not on the platform.

Feeding The Cows

The easy way of feeding the cows is the Jamesway—the James Feed Truck or Feed Carrier, and James Feed Mangers. Rolling easily along the track or on the cement floor, the James Carrier or Truck make unnecessary the lifting of heavy baskets filled with feed. With their big, roomy tubs they save much walking to and from the feed rooms, and in a short time pay for themselves in labor saved.

Watering The Cows

What a job this used to be in winter time—keeping a fire going in the old time tank heater, or creaking the ice in the tank so that the cows could drink.

And how they hated to drink—with the north wind howling, the snow or sleet driving, and the drinking water icy cold.

No wonder the milk yield dropped in winter time—for feed that should have gone to make the milk was used to warm the cow, and the water needed to make milk was never drunk.

James Drinking Cups have changed all that. A sanitary cup for each cow provides fresh water day and night. It flows in automatically as fast as the cows drink.

Water—the simplest means of increasing milk yields—is often disregarded by dairymen. Those who realize how greatly milk flow is increased by James Cups are reaping huge profits on their investment.

Reports based on milk records of 25 herds (739 cows) for instance, show an average increase per cow per day of 2.45 lbs. This is 490 lbs. in 260 days, which at \$3.50 per cwt. totals \$17.15; with a saving of \$2.50 per cow in labor and 55¢ in fuel. That's a profit of 400% the first year.

Other reports and other investigations confirm these figures. Ask us for the proof. Then get James Cups busy right away making these big profits for YOU.

"Airing" The Cows

Pure air is just as necessary to life and production of milk as feed and water.

And a cow needs TWICE the weight of AIR per day that she does of feed and water combined.

Do your cows get enough pure, fresh air?

Food, water and air. The feed costs money—lots of it. But water and air are

free—the only expense is getting them to the cow, and that amounts to very little. The James Ventilators help get the fresh air out of the barn, keep the fresh air in to the cows. Ask for full information regarding these wonderful ventilators and about the James Ventilating System.

Other Work-Saving James Devices

There are many other James devices that save labor, increase milk yields, help sanitation and improve cow health, such as Cows, Calf and Bull Pens, Feed Mangers, Calf Pen Holders, Sute-Stop Swinging Post Swinging Cranes, "Safety

First" Bull Staff, Honey Milk Steels, etc. Also equipment for the hog barn, horse barn and beef barn.

The James Way Sunny Hog Barn provides sunshine and sun warmth on the floor of every pen two-thirds of the sunlit hours. The James Hog Barn Book, sent on request, tells all about it.

Free Dairy Barn Book

The 336 page book—"The Jamesway"—tells all about the James inventions that save so much of labor, prevent spread of disease, promote better cow health, protect against dangerous bulls, make simpler the care of calves and sick cows, and increase milk yields.

Easy Installation

It explains the easy way of putting up carriers, setting up stalls and pens and attaching drinking cups.

Skilled help is not required, because of the ingenious James Anchors and because the equipment is assembled at the factory.

Barn Plan Service

It tells about James Barn Plan Service, the many James barn experts who are at your service—men who know what has been successful and what has not, what not to do as well as what to do in planning convenient, money-saving barns.

Their advice on barn planning, ventilation and other barn problems is free, with no charge for floor plans. Send for the book—a postal card request will bring it—get the full details of how to build a barn, how to ventilate a barn, how to cut the barnwork in half, how to make more milk and more money.

What Work Should a Farm Tractor Do?

Best Results Are Obtained by Applying It to a Variety of Work

By F. A. WIRT

Member Amer. Soc. Agricultural Engineers.

TO PLAN farm work in terms of the tractor is the first and possibly the most important commandment in successful power-farming. Yet how distressing it is to observe the purchase and use later of hundreds and hundreds of tractors without due consideration of this vital factor of farming based on tractor-use and not on previous methods of crop production.

Horses and mules have furnished the bulk of motive-power for farming for generations. Oxen are not included because of their relatively insignificant number. From boyhood the farmer of yesterday and today, excepting the city farmer, has worked around and with horses until it is second-nature to think of farming in terms of the horse. Crop rotations, kind of crops, labor hired, in fact all field operations are based on the use of the horse. It is not strange then when the modern tractor is purchased that the proud owner cannot change overnight his habits of thought and from that time on base his farming operations on the use of the tractor. Nor is it surprising to hear that common statement: "I want a tractor chiefly for doing the heavy work—carrying the peak load." Such a view is usually commendable but unless the owner discovers the possibilities of the tractor the utmost results will never be obtained from the tractor bought.

A tractor can be used for the peak load and more, and in the word "more" can be found the true success of power-farming. Much labor of the mind will be required to overcome the natural use of horses and to adopt new power-farming methods but to the forward looking tractor-farmer it pays and pays big.

Successful tractor use means faster work easier and better done which is exactly what every farmer wants and is a statement which should be stated again and again. With a three-plover tractor of good design from seven to ten acres can be plowed in a day, depending upon soil conditions, grades encountered, depth and speed of plowing, length of working day and a few other factors.

From 20 to 30 acres can be disked in a day, and 25 to 40 acres of grain cut. Stumps are pulled, rack wagons and hay loaders operated, fence posts pulled, wood sawed, grain threshed, silos filled and many other kinds of work quickly and profitably done if the tractor user thinks in terms not of the horse but of the tractor.

Considerable thinking mixed with real effort and seasoned with deep determination is a winning combination for the new or old tractor user who is dissatisfied with less than the best results from his mechanical source of power. One successful method is to plan out during the winter the year's work and by using a rough sketch of the farm and numbering the different fields, approximate dates of using the tractor can be entered into a book or calendar kept for their purpose. Every farmer knows of course that weather vagaries and soil conditions will change the dates decided upon, but by setting a mark to reach much more will be accomplished than could be done without such a plan, a fact proven thruout life's experience.

Proof of the pudding is in the eating thereof, so let's see what tractor users report when they acknowledge that the tractor is a failure or a success. Notice how many more different uses are reported by successful tractor users than by those who failed. Investigation made by the writer in Maryland:

Successful Tractor Users Report

Draw-bar—Plowing, 189; harrowing and disking, 213; grain binder, 44; hauling, 30; pulling stumps, 19; spreading manure, 15; pulling rack and hay loader, 13; dragging and grading roads, 13; other uses (from 1 to 6 each), 12; different uses mentioned, 21.

Belt-work—Wood-saw, 64; silo filler, 53; feed grinder, 42; threshing, 45; husker shredder, 20; corn sheller, 16; hay baler, 11; other uses (1 to

2 each), 4; belt work (not specified), 25; different uses mentioned, 11.

From Tractor Failures

Draw-bar—Plowing, 50; harrowing and disking, 54; grain binder, 7; hauling, 4; hay loader, 2; pulling stumps, 2; dragging and grading roads, 1; manure spreader, 1; uses stated, 9.

Belt-work—Wood saw, 12; silo filler, 11; threshing, 11; feed grinder, 6; husker shredder, 4; hay baler, 4; corn sheller, 2; belt work (not specified), 6; different uses mentioned, 7.

Notice the wide and varied use of the tractor by the successful owner both for drawbar and belt purposes as contrasted with the uses reported by tractor failures. A deep lesson can be learned by comparing 21 and 9 the respective drawbar uses also 11 and 7 belt uses.

Another noticeable fact is the predominance of drawbar over belt work which indicates that the tractor is used first for the peak load of plowing and harrowing and then for whatever drawbar or belt work that can be handled always remembering however that the user who thinks in terms of the tractor finds more work for the machine to do.

It Pays to Load a Tractor Well

Belt work, it will be observed from the data above, is quite important, altho it would seem that many more could find profitable use for the belt pulley. On the other hand many tractor users use their machine for belt work exclusively, or almost so. Just the other day a farmer told the writer that he used a tractor for belt work only and never used it for plowing, disking, etc. He went on to explain that his tractor was too heavy and didn't have sufficient power to plow the grades on his farm. This tractor user would be better off if he sold his present machine and bought a tractor adapted to his conditions.

Additional evidence on the necessity of farming in terms of the tractor is hardly needed but more light can be found from the same reports quoted above.

Successful tractor owners reported an average of 59.3 days use in the year while the failures reported only 35.7 days yet the farms owned by the tractor failures were a trifle larger.

Still more evidence of the same kind can be found in the answer to the question: "How large must the farm be before a tractor is profitable?" Successful tractor users 107.9 acres Failures 154.8 acres

In one case 107 acres furnishes enough for a tractor and in the other case it takes 154.8 acres. The tractor user who plans his farming operations around the tractor as chief source of motive power has far greater chances for success in every respect with his tractor.

THE PRIZE TRACTOR ARTICLES

In response to the request made a few weeks ago by Pennsylvania Farmer for the personal experiences of readers with tractors a number of articles of exceptional value have come in. We

are sure their publication from time to time will help to enlighten the many farmers who are considering the purchase of a tractor. Below will be found the first of the series. We give it first place because of the size of farm, difficult conditions and the variety of uses to which it is put.—Editor.

OUR TRACTOR EXPERIENCE

A Pennsylvania Farmer Finds a Tractor Valuable on a Small Farm of 45 Acres.

First Prize Article

It is a much-discussed question whether a tractor is practical under our eastern conditions or if they are adapted only in the West on their large, level farms. Of course, the advertisement and agents say they work anywhere, but the experience and advice of our fellow-farmers is more to be depended upon. Further, in a purchase of this kind we want to consider many things before taking a step that cannot be retraced and which takes many hard-earned dollars. It is because of the help to those who may be seriously debating what to do about buying a tractor outfit that we are giving our experience.

We live on a small, hilly farm in York County, Pa., of 45 acres, 40 acres of which is planted to trees from 1 year to 11 years old. About two acres are level, balance is hilly, not rolling. Part of these hills have always been plowed with a hillside plow, while part cannot be plowed at all. A year ago we scouted the idea of ever using a tractor. "New occasions teach new desires." At least they make us hunt up methods. When the dry period of last June hit us a plot of two acres of trees that had not been stirred for 7 years, gave signs of suffering from lack of moisture. This piece had been giving us \$25 worth of fruit to the tree, so something had to be done. Low trees and close planting precluded horse culture. Again, a disc drawn by horses would make little impression on such hard soil. This condition brought our first thought of a tractor. Was it possible to use one here? Was it practical? Was it economical? What kind should we get? Who ever can answer those questions to every farmer's satisfaction is surely a friend in need.

At a recent demonstration we saw the one, which if any of the three machines demonstrated, would answer our purpose. Saturday we telephoned the agent explaining just what we had to do—a hard sod to be cut up, a hillside to be disced that had to be plowed with a hillside plow, and stumps to pull. Pretty hard problems, but we did not want a plaything on the place. They said, "we will try it." Monday found them on the job, but as the operator looked from the top of the hill where he was supposed to go down and come up again, he said it was the hardest job he ever tackled. In a few words, they left in the evening, and we had a piece of machinery that cost a sum that makes a farmer think twice these days before investing in it. Fact is, it took courage and sober thought to lay out that much money when our friends said we could never use it, and again, we were on the eve of a great fall in prices.

Every winter and spring we put hay, weeds, manure, etc., under and around the trees in this two-acre plot and this was not decaying rapidly enough, so that the mice were beginning to make us trouble. We put a heavy slab of concrete on the disc and went thru there until there was not enough for a mouse nest left. This we did every two weeks until the middle of August, when we seeded the cover crop. Now, next spring we are ready to handle that without a plow, working it in the soil as it should be. The trees and fruit (Continued on Page Six)

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

COMMON SALT AS A FERTILIZER

COMMON SALT has been in use as a fertilizer for a long time. The farmers of the Orient long ago recognized its value as well as its limitations. For instance, the ancients knew that large quantities of salt tended to make land unproductive or even sterile. Thus, the Jews used large quantities of salt on enemies' fields that they wanted to make barren. The Romans used to spread large quantities of salt in places where some serious crime had been committed. While it is evident, therefore, that common salt has been used by Old World farmers both as a fertilizer and as a soil sterilizer, they did not understand how it acted in either case. In fact, the more enlightened farmers of the present day find it difficult to account for the contradictory results obtained from the use of salt. In order to understand the effect of salt on land, one should make an effort to find out what chemical or other changes are produced in the soil when salt is applied to it. The results themselves will depend on the soil, on the crop and on the methods of application. In the case of very heavy soils, small application of salt will tend to granulate the soil material and to make the soil texture more open and mellow in character. Salt will also have a tendency to hasten the decomposition of cer-

tain soil minerals, particularly those containing potash, lime and magnesia. Similarly, small quantities of salt will stimulate the activities of soil bacteria and, in this manner, cause the formation of larger quantities of ammonia and of nitrates. On the other hand, larger quantities of salt may injure the crop directly or indirectly thru the chemical changes produced in the soil.

There are crops which seem to be favored in their growth by fairly large applications of common salt. Mangels and asparagus, and, to a lesser extent, flax, cabbage, turnips, etc., seem to react favorably to applications of common salt up to several hundred pounds per acre. Asparagus in particular seems to be able to stand large applications of salt that would unquestionably prove very injurious under the same conditions to other crops. This fact was brought out strikingly in the vicinity of Riverton, Burlington County, New Jersey, in the summer and fall of 1920. The entomologists at the Riverton laboratory, in their attempt to check the spread of the Japanese beetle, applied large quantities of common salt along the roadsides for the purpose of destroying roadside vegetation. The applications were at the rate of two tons of common salt per acre, and in some places the application was repeated so that the total quantity used was at the rate of four tons per acre. Most of the vegetation along the roadsides was destroyed by the application of two tons of salt per acre. It was evident, however, that this quantity of salt did not cause serious damage to volunteer asparagus which grows in abundance along the roadsides in that region.

It has been observed, likewise, that common salt may affect the quality as well as the quantity of the crop. In the case of potatoes, larger

applications of salt seem to make the tubers less mealy. Similarly, in the case of sugar beets, applications of several hundred pounds of salt per acre will reduce the proportion of crystallizable sugar in the juice. For this reason, there is an objection to salt itself or to other fertilizers containing large proportions of common salt for crops like potatoes, sugar beets and tobacco. Muriate of potash will produce a similar effect on these crops and for this reason, sulfate of potash is often preferred by potato, sugar beet and tobacco growers who practice intensive methods of fertilization.

While common salt is not in itself a direct fertilizer, it can be so used as to help increase the supply of available food to growing crops. When used in amounts of 150 pounds per acre, or less, common salt will often help the crops to secure a more ample supply of potash from the soil. This is true also of nitrogen and of phosphoric acid, but to a lesser extent. It is probable, however, that salt may be used most effectively together with farmyard manure. Farmers of 50 or 75 years ago not infrequently added salt to the manure before hauling and spreading it on the sod land. They firmly believed that salt increased the returns from the manure. It is not unlikely that this practice may be revived with profit even in this day of commercial fertilizers. Additions of common salt at the rate of 5 or 10 pounds per ton of manure are likely to improve the quality of the latter and to lead to larger crop yields. In a word, while common salt is not a direct fertilizer, it can be so applied as to increase the availability of certain of the plant-food constituents in the soil. It can also be used for mixing with farmyard manure, thereby making the latter a more efficient fertilizer.

Why the East Failed to Get Any Blue Ribbons

An Observing Visitor to the "International" Describes Winning Qualities in Corn

By A. D. Radebaugh, Maryland

CAN YOU imagine yourself and four other men having nearly three thousand entries of corn (ten ear and single ear exhibits), wheat, oats, barley and rye staring you in the face and have to tell the exhibitors and on-lookers which is the best sample in each case and on down to fiftieth place without a single mistake in placing? This is what really happened at the International Grain and Hay Show in Chicago Nov. 27th to Dec. 4th, 1920.

As one interested in this work, and because of the wonderful benefits derived from attending this show, I will endeavor to give Pennsylvania Farmer readers an idea of what is necessary to be one of the few prize winners.

First, we must know what are the essential points to make an exhibit attractive enough to catch the judges' eyes and hold them fast on the exhibit until the final decisions are rendered. These points I am going to discuss as I noted the judges in their work of placing the samples.

- First. Attractiveness of exhibit.
- Second. Uniformity of exhibit.
- Third. Market condition of exhibit.
- Fourth. Points of perfection in exhibit.
- Fifth. Adaptability of exhibit to region where grown.

Attractiveness of Display

The old saying, "The first impression is the most lasting," seems to apply here better than any other I can think of. By attractiveness of display I mean placing each ear, if it be corn, so it will show its imperfections least. Place the

Grand Champion 10-Ears at International Hay and Grain Show, Chicago, 1920. Grown and Exhibited by C. E. Troyer, Indiana

ear according to length and color so one will not bring out the defects of another, but will help to cover the defects and bring to the front the strong points of each individual ear. This may seem to some readers as though I advise being deceitful to the judges but one who has tried to pick show corn will realize the perfect ear of corn has never as yet been produced and we can pick only those as nearly perfect as possible, and arrange each ear to show off to its best advantage. As a corn judge and breeder I can safely say this is what even the judges look for the exhibitor to do.

Uniformity of Exhibit

Uniformity of exhibit is where more real work can be spent to make an exhibit a prize-winner than any other factor. Now, to cover a few points noted in particular from the judges. Each ear of corn should contain twenty rows, no more or less. The length of variation should never be greater than one-half inch and the best exhibits at this show did not have over one quarter-inch variation. The color shades of the exhibit

should be regular. Do not have deep yellow and light yellow ears in the same sample. Uniformity of color counts a great deal. This applies more to yellow than to white corn. Also be careful of the starch content of each ear. One starchy ear in a sample, even though it may be a wonderfully well shaped ear, will be very apt to eliminate your sample from the winnings. I noted the western judges are far more opposed to starchy

corn than the judges in the east as this has been studied by them and even the farmers lay great stress on corn not being starchy, when picking for seed and show. The question of smooth or rough types of corn seems to still be open for argument, and the judges themselves do not agree. The corn growers of Indiana and Missouri where the growing season is long, prefer a large, rough type of corn, the ears being from ten one-quarter to eleven inches long, while the Ohio, Illinois and Iowa growers prefer a medium smooth type, with ears nine and three-quarters to ten and one-quarter inches long. Therefore, the exhibitor having ears about ten to ten one-quarter inches in length, and medium rough grain, is apt to receive the support of all, as a compromise is always necessary before finally placing samples.

Much good can be gotten from a careful study of the Grand Sweepstakes sample. These ears were from ten to ten one-quarter inches in length, contained twenty rows each, and were medium rough in grain. The kernels pulled clean and each one contained large germ and showed a

(Continued on Page 17).

Farm Products Show

THE PRODUCTS SHOW which will be held next week at Harrisburg promises to be the biggest thing of its kind ever held in the state. It will, no doubt, be well worth while for farmers— young and old, male and female—to make any reasonable sacrifice to attend. In addition to the usual line of exhibits, the blue-bloods of Pennsylvania's cattle will be exhibited. They will include the blue ribbon winners at the International Cattle Show held at Chicago, and will offer the first opportunity for visitors to see high-bred cattle at a Products Show. Every visitor to the Show should become a booster for a State Fair in which the agriculture of the state would have a better chance to be displayed both as to space and season.

Daylight Saving Bills Again

THERE is little doubt but that the old fight over daylight saving bills will be staged in Pennsylvania, New York and New Jersey Legislatures this winter. This is one subject upon which there is a very definite disagreement between the people of the cities and those of the farms. The division of sentiment arises out of the difference in working practices in city and country. The universal eight-hour and nine-hour day of the cities and towns makes it not only possible but desirable in most instances to practice daylight saving during the summer season. On the farms the situation is just reversed. From necessity farmers must work "from sun to sun." It is not only an economic necessity, but the very nature of their work makes the standard day better suited to farm work. Under the daylight saving plan, farmers in many lines of work lose an hour at each end of the day and save time no place, so that the term is a double-barreled misnomer.

Government and Business

THERE is a bit of unconscious humor in the action of the National Grange which, after it quoted and approved the cryptic saying, "Less government in business in government," turned around and demanded that the government do several specific things. There has been a very general demand on the part of the public that the government shall not engage in competitive business enterprises, and this general public sentiment has been construed by many people who wish

Pennsylvania Farmer

to be "left severely alone" to mean that the government (the people) shall not have any control over the rates, prices and methods of "Big Business." There is a danger just at this time when reactionary sentiment is uppermost that we will lose what was gained before the war. The demands from every quarter for "relief," "freedom" and "unmolested opportunity" are most insistent and present signs indicate a tendency to grant a greater degree of special privilege than formerly existed. It is because of this danger that we oppose the farmers' asking or accepting special favors and class privileges at this time. It is not enough that a governmental policy apply equally to all classes; all policies, to be acceptable, should be economically sound and morally just. The world war interrupted the upward movement in government and governmental regulation in this country, but the reconstruction period provides an opportunity for taking backward steps which certain interests are not slow to embrace. Farmers, look out for baited traps.

Wanted: A World-Trade Policy

This Country Must Continue to Export Farm Products if Agriculture is to Prosper

IF THE INDUSTRIES of this country are to be run to capacity it is necessary that our national policies be such that we can hold a large part of the world's trade which we secured during the war. Every one of our great national industries is capable of producing more than can be absorbed among ourselves. In spite of this fact, there seems to be prevalent just at this time a desire to detach ourselves from the world's trade by demanding wages and prices which make it next to impossible to do business with other countries. Of course, there is the unfortunate condition of exchange rates, but that will gradually improve in most instances and it will be shortsighted on our part if, for the sake of temporary gain, we lose our export trade.

Just how much farm prosperity depends upon a foreign market is strikingly illustrated by a comparison of the present prices of farm produce with those of two and three years ago when we were feeding a large part of the world. At the conference of Governors held at Harrisburg a few weeks ago the farmers' condition was pronounced "acute," "alarming" and "tragic." Farmers' organizations everywhere have been discussing this question almost to the exclusion of every other. Congress has given it more attention the past month than anything else, but, unfortunately, nothing of a broad, constructive nature has yet been proposed. The only thing suggested is the exclusion of food products from other countries, seemingly forgetting that that policy alone will, if it does what it is hoped it will, set a price which will make the exportation of food from this country impossible. We agree with others that farmers should have the same consideration in setting tariff schedules as other industries, but our criticism is of the future national policy, or lack of it.

The American farms are big enough and rich enough, and American farmers are capable of operating them so that we can feed not only our own people but millions more, and it is essential to the prosperity of agriculture that a steady stream of products be kept flowing to foreign markets. If this stream stops, farmers must reduce production or the market in every line of production will be continually over-supplied, with consequent low prices.

During the last ten years our agricultural products furnished an average of 46 per cent of our total exports. During the war the proportion ran as high as 55 per cent. Yet in spite of this large exportation, and even with the handicap of help shortage, under which American farmers labored, they were able to produce it and keep America well fed at the same time. The necessity for a continuation of export trade is self-evident. A meeting of the National Foreign Trade Council, of which James A. Farrel, President of the U. S. Steel Corporation is chairman, will be held in Cleveland next May and it is likely that the question of agricultural exports will be given equal consideration with other lines.

In the meantime, let us see that we do not adopt a policy that will make a revival of foreign trade impossible. We will be creating nothing short of a 1903 paradise if we, for the sake of

continuing war-time investment income, wages and prices, drop out of the world's trade, hoping to continue our prosperity simply by trading among our own people. Our financiers and statesmen have an unequalled opportunity to prove their ability in working out a plan by which we may safely and profitably help European nations to recuperate and keep on buying their necessities from this country.

The consular service of a country is an important factor in the development of trade in foreign countries. Many other nations make a special point of developing and training competent men for this work so that when they are appointed to a country they are able to develop business for their native country. Unfortunately, the consular service in this country is merely a political plum tree and the posts are too often filled by men who are appointed as a reward for partisan service instead of fitness for the position. The greater part of the normal trade of this country has been developed by private enterprise with all too little help from the consuls. It is an opportune time to agitate the formation of a new basis for our consular service.

Our Washington Letter

Co-operative marketing, farm cost accounting and farm efficiency were among the outstanding subjects discussed at the eleventh annual meeting of the American Farm Economics Association held in Washington during the week ending January 1, 1921.

In his address on "The adjustment of the Farm Business to Declining Price Levels," Dr. H. C. Taylor, of the office of Farm Management of the Department of Agriculture, quoted history showing that war is always followed by high prices, and then a disastrous slump. He said that in the main the sudden collapse in farm prices was due to under consumption rather than over production. In the present instance, however, the cost of living on the farms remains relatively high. In regard to the question, "What can farmers do to curtail expense," Dr. Taylor suggested that every farmer will find it to his interest to repair old machinery. They should co-operate in putting their machinery into shape and in use of machinery.

The economic and legal status of collective bargaining was discussed by C. Morrill of the Bureau of Markets, who said that when the Sherman anti-trust measure was before Congress back in 1890 the need of exempting farmers from the provisions of the bill was discussed and an amendment to that effect added to the bill. When the bill was passed, however, the amendment had disappeared. He argued that the Volstead collective bargaining bill, as it was passed in Congress, does not permit the federation of farmers' co-operative associations under a central sales organization. The bill in effect seems to give additional jurisdiction to another agency of government to investigate and regulate co-operative marketing associations; but it does not take away anything from the Department of Justice in anti-trust law enforcement. As federations of marketing associations do not come under the Volstead bill they go back to the Sherman anti-trust law.

Mr. Morrill said he did not look upon the Volstead bill in its present form as accomplishing a great deal of what the people are looking for.

Ashur Hobson, of Columbia University, in discussing the fundamentals of co-operative marketing, said he believed that success in marketing co-operation will come thru efficiency rather than elimination of private profits. Co-operation which does no more than eliminate private profits is on the high road to starvation. The success of farmers co-operatives depends upon their ability to furnish a continuous supply of standard products.

The necessity of having along side the marketing association an educational movement was emphasized by Charles A. Lyman, of the National Board of Farm Organizations. In regard to farm legislation Mr. Lyman said it took a year to get the Volstead bill thru Congress. Months were required to get it out of the committee, then it came out in a form which nullified its effective provisions, and it is rumored that it is due for a veto.

Some interesting facts and figures on farm tenancy were given by Professor B. H. Hubbard of Wisconsin University. Tenancy is much more prevalent in regions of high priced farm lands than in sections where the prices of farm land are low. In Ohio there has been a decided decline in tenancy in twenty years, according to the 1920 census. In the North Atlantic states farm tenancy has decreased since 1910, while in Iowa it has increased slightly. It is evident, concludes Dr. Hubbard, that farm tenancy and ownership have reached a balance, with no prospect of a landed aristocracy.

"Propaganda cost accounting," was the way

Dr. Durand characterized the system coming into quite common use. "I am a great believer in cost accounting, but cost accounting in this country is in danger of being a mere tool of the propagandist. Things are getting to the pass where cost accounting might almost be defined as the science of making the public think you need a higher price."

"If a propagandist wishes to prove that the farmers need a higher price for a product, it is easy to do so; but if he colors the cost too high the result may be to turn many farmers from producing that product though it may actually be relatively a very profitable one. Another possible result is that the public will fail to believe, and the last state of the farmer will be worse than the first. * * * There is a tendency in propaganda cost accounting to try to get all the items in that will make the price seem reasonable, or keep it from going down."—Elmer E. Reynolds.

HARRISBURG LETTER

An Expectant Legislature.—The members of the general assembly of Pennsylvania having demonstrated that they could organize a biennial session in unprecedented harmony are now awaiting the legislative program with considerable interest. It is doubtful if in years so many members have arranged to keep bills in their inside pockets until they see what is coming from the Governor's office. Various commissions and committees have been meeting and have prepared drafts of measures which will be laid before the Executive and the heads of departments are waiting to talk over their plans. The Governor has determined upon the plan of personally addressing the two houses instead of sending in a message which is printed and to which no one reads when it is read. He takes the position that a personal address makes a better impression and that delivery after the recess is more opportune than at the start. There is no question but what he is right and as far as the precedents go Spruill was a legislator so long that he feels at home with the members and they with him. The Governor will outline his ideas on educational allowances, taxation, liquor, reapportionment, highways and public works.

Going to be Short.—Notwithstanding the misgivings which prevented the formal fixing of April 28 as the date for adjournment when the lawmakers met, a sort of understanding to quit that day was reached. It is subject to change and during the recess the opinion has been freely voiced that the session is to be ended before May and that things will go with a rush. By steady work the Legislature can finish easily in April, but it cannot do so by adjourning at the close of two days' work each week and allowing a racket in Philadelphia or Pittsburgh or some up-state boss's aggrieved feelings over apportionment to drag out the sittings.

Some Big Things.—The biggest proposition of the session is, how much additional money is to be voted for the schools? Some of the lawmakers declared in favor of at least \$20,000,000 and both President pro-tem Frank E. Baldwin, and Speaker Robert S. Spangler are inclined to be liberal in regard to education, but if that \$20,000,000 is given it means a tremendous chop either in state governmental or hospital appropriations or the alternative of new taxes. Much is being said in high quarters about new taxes, but they mean a fight and a fight with the federal patronage not yet given out might turn out to be one-sided. And as for reducing the state payroll, that is about as likely as adoption of a wholesale policy in regard to charitable appropriations. Then there is the question of money for highway building for two more years and the \$2,500,000 which is needed to start a real forestry program. The state may have \$120,000,000 to appropriate, but it will have to be thinner in spots than some people now realize.

Control of Firearms.—The time seems to be coming when in addition to stiff sentences for persons who turn to banditry there will be a system of registering sales of firearms just as druggists register poison sales. It is also suggested persons be required to demonstrate fitness to have

Pennsylvania Farmer

firearms. As there are questions every now and then about the fitness of some people to run automobiles which are more dangerous than shotguns in the hands of some individuals it would seem legislative clarity would have to be invoked.

Up to the State.—The net result of the conferences in regard to milk standards is that the State will establish rules to carry out provisions for the certified, pasteurized and grade A milk. The Department of Health will make some suggestions and the fight will be carried into the House of Representatives. The temperature problem seems as great as ever. And it will be until an agreement on decrees that all will support is reached.

State to Buy Few More.—The State of Pennsylvania will not buy many more toll roads. Under rulings made state money will be used only for purchase of toll roads on state highways and there are but one or two left that are worth while. But there are still many toll roads on township highways that are a cause of complaint and which counties must purchase. Lancaster, for instance, has over sixty miles of toll road.—Hamilton, Harrisburg.

NEW YORK LETTER

Cattle Prices.—At the first day of the ninth consignment sale of purchased Holstein cattle in Liverpool the average price received for 70 head was but \$125, a very low figure considering the quality. Dairy stock sold for beef brings about \$15 to \$20. Even veal calves have dropped to a low figure.

Bigger Milk Drop Forecast.—The Jefferson County dairymen expect a further drop in milk prices in February of a few cents a hundred. Cheese factories of northern counties are running at a minimum and these dairymen believe the problem of cheese and butter manufacture so different from liquid milk sale and distribution that it demands a separate management. League officials, however, believe that one management, wherein each line of work is made to supplement the other, with a division of sales pro rata, will be best for both interests.

Pooling Plan Extends.—During the past few days Dairymen's League officials have been pushing the pooling plan very vigorously, with splendid results. If only an average of 10 new signatures from each local branch in the state is received the needed number will be obtained. Over 30,800 on hand with 5,000 in transit, and the greatest handicap now being in the limited number of signers available to explain conditions. The 15,000 additional signatures will be a matter of but a few days, it is thought. The tripling of the sums to be spent in advertising milk as a food in the East the coming year is expected to do much towards easing up the dairy situation.

New State Administration.—Governor Miller's inaugural address sounds a new keynote in administrative circles, that of conducting the government for the benefit of those who pay taxes instead of those who spend them.

Co-operative Development.—It is shown that Michigan potatoes are sold in New York State markets and New York potatoes sold in St. Louis, with the consumers paying the freight. Co-operative marketing organizations will correct such evils. They are developing so rapidly in this state that the next problem to consider is the relation of these organizations to each other. The G. L. F. Exchange is expected to assemble much of the products to be sold, and to unite and harmonize all such efforts. It has organized units in some 20 counties now, and is growing fast.

Working for Big National Event.—S. A. Vandervort of Sydney is entrusted with securing outstanding state animals to enter in the big sale at the annual meeting of the National Holstein-Friesian Association in Syracuse in June. The meeting is expected to be an even bigger event than the St. Paul meeting was last June.

Standards for Table Potatoes.—Representatives of all the potato sections of the state recently met in Syracuse to establish standards for grading potatoes and to establish local selling organizations.

Regional committees will be appointed to develop such selling organizations. There are now 23 local organizations functioning successfully. These will be used as a nucleus for forming other new ones. Warehouse facilities will be provided, so that fall overcrowding of markets will be avoided.
—M. G. F.

NEW JERSEY NEWS

Jersey Legislature Opens.—The one hundred and forty-fifth session of the New Jersey Legislature convened on Tuesday. Collins B. Allen, former Senate floor leader and prominent Republican, of Salem, is president of the Upper House, while William B. Mackay, of Bergen, is majority leader in the Senate. George S. Hobart, of Essex, is Speaker of the House, while T. Harry Rowland, of Camden, is House Majority Leader. There are fifteen Republicans in the Senate and six Democrats, while in the House there are fifty-eight Republicans—two of whom are women—and one Democrat, who comes from the agricultural constituency of Warren. One of the Hudson Republican delegation died since election, thus reducing the majority to the number named. The Republicans have a majority of nine in the Senate and 57 in the House, while the Republican majority on joint ballot in the entire Legislature is 67. One of the measures of a party character and proposed by the women wing of the Republican party provides for women sitting on juries as well as serving as presidential electors, while others place two women on the State Board of Education and State Board of Health. Party bills presented this week provide means for the financing of the bridge from Camden to Philadelphia and the tunnel from Jersey City to New York. A measure enabling the State Bureau of Markets to show to the consumers of produce in the state what the prevailing prices should be was also introduced. The prevention of raising of foxes in New Jersey in order that farm crops will not be damaged or destroyed by these animals is now almost ready for introduction. In his message to the Legislature, Governor Edwards urged that that body refuse to enact any legislation that would revive the old "Blue Laws" or strengthen them, and that he believed it to be to the advantage of the churches that such legislation should not prevail. He suggested the creation of a special committee from both the Senate and House to confer with him, so that there will be presented to the present Legislature some concrete program that will take into account the necessity for good roads, requirements of state institutions and agencies, etc. In regard to taxation, Governor Edwards stated that "the practical problem of taxation now confronting us is the problem of so making our tax levies, that all property subject to taxation shall contribute to the support of government precisely in proportion to such property. In respect to motor vehicle license fees, Governor Edwards said that "experience of the past few years demonstrates that the receipts from motor vehicle fees have not been sufficient to keep pace with the maintenance needs of the highway system and of county roads. The reason therefore seems to be the destructive effect of the modern motor vehicle—both pleasure and business. There are two remedies—one to limit the weight of motor vehicles and load to a minimum of twenty-eight thousand pounds, and the other, to increase the amount of the revenues. He suggested modification of the labor laws of New Jersey, so as to provide for women an eight-hour day, a forty-eight hour week, and the prohibition of night work for women employed in manufacturing after ten o'clock at night and six o'clock in the morning. Speaking of a revision of the criminal laws, the Governor stated that "my constitutional duty, as a member of the Court of Pardons, has brought me into such close relation with the operation of the criminal laws, that I feel impelled to suggest the necessity of appointing at an early date a commission to revise and codify such laws." He suggested the passage of bills that would ameliorate the condition of labor.

—Kelly, Trenton.

The announcement that "the government will prosecute coal profiteers" is one of those things that comes under the category tersely described as "interesting, if true."

He Forgot That Little Fish Sometimes Grow to be Big Fish

CRABINE TRIPLE WALL SILOS

YOU can easily rebuild your old broken-down stave silo into a new, permanent Crabine—the hand-somest, strongest silo made—and save half the cost of a new silo. The Crabine is a great economy because its moderate first cost is its only cost for many years. The inner wall is of upright staves, closely fitted. Then comes a wall of Silafelt—waterproof, air-proof, frost-fighting. Outside is the spiral smooth-finish Crainelox covering that winds to the top—protecting and reinforcing every square inch. No hoops, no repairs—your silage is better, your investment is safer, your work and anxiety are reduced.

Ask us for full particulars of how to rebuild silos. Write today for literature and agency terms.

TRACTOR EXPERIENCES

(Continued from Page Two).
recovered at once and we had the heaviest crop up to this time. In another plot of 200 trees we had rye that was in head, and blackberry canes on the tree rows. You all know what this would mean with a long plow. This was cut both ways with a disc and then plowed as smooth as a garden. Next came the old strawberry bed. Here is one of the most difficult pieces to get in shape after tramping over in picking, also having weeds, and coarse manure used for the winter mulch. This was gone over both ways with the disc and then plowed. Then disced again both ways. And behold, the finest prepared piece of land you ever saw. Fine in the bottom to allow capillary attraction to furnish the moisture, and plowed deeper than ever before. All done with the tractor.

Another operation that made us money and saved time was the raising of three trees that went down under their load of fruit. In one hour we did what would have taken several days and much hard work. Of course, I understand it would not pay to buy a tractor to pull up a few trees, but this is only one of the many instances in which it performed the unusual job.

Another piece of work that we could not have done without the tractor outfit was the re-seeding of a worn-out meadow of three acres. We cleared an acre of woodland to this, cutting down the large trees and pulling the smaller; the briars were disced into the soil. All was covered with manure and ground limestone. This was worked into the soil by going over it three times and then seeded to grass. A cleaner, better looking piece of work was never done on such land.

In seeding corn ground the tractor outfit is something marvelous. Parts of our corn were so weedy that it would have been necessary to mow, rake and burn the weeds before preparing the soil for the grain. We cut two rows of corn where we wanted the shocks and threw it to the side. This was seeded with the drill and the boots fastened up. Then the disc was run over it, cutting the trash and covering the grain. When corn was cut, the operation was repeated between the shock rows. All the weeds and many of the stubble had disappeared and were in the soil supplying the much-needed humus instead of having to be hauled off and burned.

Another place we worked to advantage was in clearings in which the stumps had not all been removed. With these cut low we seed to buckwheat or rye and work into the ground with the disc, going over the top of the stumps. Later in the season a sawmill was added to the equipment and now we are sawing lumber for needed repairs as well as for sale.

As to cost of operation, we find that the plows and the saw-mill require the most fuel—we use all gasoline. It takes 12 gallons of gasoline per day and one quart of oil. So far, no repairs have been needed; have had no trouble, and it starts readily in cold weather. To date we have done 45 hours field work at a cost of \$17.93, or 40c per hour. This allows nothing for upkeep nor depreciation, only actual expenses. Forty-five hours seem a short time for operation, but remember we bought after the spring work was done, and we put little seeding out. Neither does this take into account of the time spent on odd jobs on the place,

such as cutting fodder, sawing wood for home use and market, grinding, pulling the sprayer, etc. All this may sound like a small affair, but I said in the beginning I would give our experience, not what we imagined we did. It seems to me we farmers want each other's experience, rather than the high flown theories, and flowery language of those whose hands have never been soiled, nor trousers torn by bumping up against real farm conditions.

What is my judgment after a summer's trial? I honestly believe that the large farmer with the proper conditions, cannot, I say cannot, afford to do without an outfit, providing he gets a good disc and a tractor that will not pack and which will do what is claimed for it. About the small farmer? Well, he had better go slow unless he has plenty of money and wants to experiment. Were it not for three things we could not afford to have an outfit, looking at it from the practical side, also the economical. Our fruit first. It seems to me a suitable tractor and disc and successful fruit-growing are inseparable, especially under present day conditions. Further, in the clearing of new land it is invaluable, and then the heavy power can be utilized on the saw-mill.

Finally, study your conditions, be sure you know what you need, and then get only what you want.—Clayton F. Weaver.

GOOD VENTILATION A BOON TO STOCK

If your stable has a foul, stifling odor in the morning and if there is frost on the side walls and ceiling, then your building needs ventilation. It is not always possible to keep out all frost, but there should be very little, if any, except during the bitter cold days of winter.

Barns should have walls that are built to keep in the warmth of the stock. There should not be cracks around the doors and windows where the snow and icy blasts can blow in. It is best to use storm windows on all openings into the stable. Do not have a large stable with only a few head of stock in it. If you do not need all of the room, partition off a part of it. Even a canvas can be used for this purpose. A cow should not be required to heat more than 700 cubic feet of space; about 550 cubic feet is an average value. A horse may be expected to heat about 1000 cubic feet of space, but 700 or 800 cubic feet is a fair value.

Make sure that the air intakes are provided with shutters or dampers so that you can control the amount of air coming in. Likewise, a shutter is needed on the foul air flues to control the amount of air removed. It is a good investment to buy a thermometer for your stable. Hang it in front of the stanchions, about level with your head. The temperature of the barn should be about 32 to 40 degrees when outside temperatures are around zero to 10 below.

With the proper number of cattle or horses in it, and with the ventilators working properly, a well built barn will not be colder inside than 35 degrees even at outside temperatures of below zero.

As milk is about 88 per cent water, it stands to reason that cows must drink heavily. A few dollars invested in a tank heater to bring the water to a comfortable drinking temperature, will save a good many more dollars thru the coming winter.

Your Private Cow Doctor

If cows could tell their feelings, many a serious illness would be prevented, and constant milk losses would be saved.

Milking cows, particularly, are subject to many ailments that are first manifested only in a reduced milk yield.

Such cow ills you can treat yourself with the aid of Kow-Kare, the great cow medicine. At the first sign of reduced milk flow try Kow-Kare. Use it according to directions and watch the story the milk pail tells.

Dairymen everywhere know the value of Kow-Kare both in preventing disease, and in treating such ailments as Barrenness, Abortion, Retained Afterbirth, Scouring, Lost Appetite, Bunches.

No cow barn should be without Kow-Kare, your private cow doctor. Sold in 70c and \$1.40 packages by feed dealers, general stores and druggists.

OLEO LICENSES BREAK ALL RECORDS DURING PAST YEAR

The Bureau of Foods, Pennsylvania Department of Agriculture, shattered all records in the number of oleomargarine licenses issued during 1920. During the year just closed there were 6,284 licenses issued, as against 5,788 issued in 1919, which previously held all records.

There is a strong indication that 1921 will show more licenses issued than during any previous year, as more than 4,100 were issued up until New Year's Day, 1921.

Following are the tables showing the licenses issued in 1919 and 1920:

Retail	5,543
Boarding House	157

THE SILO A SIGN POST

The silo is a good place for a farm sign. It is the most conspicuous building on the farm. As a rule, it towers high above the other buildings, and is matched only by the windmill or a very tall tree. Any farmer who believes that it pays to advertise should seriously consider a farm sign. Get some painter who can do fairly good lettering and get him to put a sign on your silo. Go to the road in order to get the correct view. Take a view from the road in front of your barn and to right and left, then choose the most conspicuous part of the silo. This is generally found close to the top. If you are advertising the name of your farm, use the name and follow with your own if you wish. Breeders of all kinds of pure-bred stock should keep in mind the fact that advertising is a very essential feature in their success. There are continually going thru the country men looking for various breeders of livestock. Give them a chance to learn of the business you are in without looking you up in the field or calling at the door.

Occasionally the farm buildings are so situated that the "ad" should appear in more places than one. The gable of the barn or a conspicuous building so located that it can be observed for a long distance from either railroad or highway should bear the sign. As practically all silos are round, it is hard to get a view from any point that does not give a good surface for a short-to-the-point sign. For this reason the silo is the most conspicuous billboard on the farm.

However, the principal use of a silo is not in the capacity of a billboard or sign post. That is only one of its many good uses. The stock farmers without a silo is likely to need such an equipment more than he needs a sign. The fact that he has no silo is a sign in itself that he lacks the best and most economic food for his stock. All feeding experiments and tests prove this to be true, and our progressive stockkeepers are indeed "reading the signs" and recognizing the silo's value.—A. I. Haecker.

Designed with consideration for the cow and in observance of the principles of milk secretion

A Better Way of Milking

LONG ago the De Laval Company realized there is no more reason for hand milking than for harvesting a grain crop by hand. But designing a milker was not simply a problem in mechanics. A successful mechanical milker must work in harmony with the delicate organism of a living cow.

After many years of thorough research and test, and after four years of commercial use, the De Laval Milker has proved itself to be a better way of milking.

Now the many De Laval users are practically unanimous in their agreement that it not only saves time and eliminates drudgery, but actually increases the flow of milk.

The De Laval will make your dairy business more profitable and pleasant. Write for full information.

HORTICULTURE

A Call for Co-operation

By Dr. J. P. STEWART

READERS of the horticultural section of the Pennsylvania Farmer have doubtless noticed that we have been pegging away for several years in an effort to give them the benefit of any improvements or helpful suggestions that came to our attention along fruit-growing lines. We have also called for opinions, experiences, suggestions or criticisms from our readers from time to time, and have received some very valuable items in this way, but as a rule the responses were conspicuous by their absence, or in any event they were much too few, so that we had to lapse into the usual one-sided monologue, without knowing whether our discussion was really reaching its goal and assisting in meeting any one's actual problems or not.

This course can still be pursued, but we would rather not have to do it, if it can be avoided. It would be so much better, and would put so much more life into the proceedings, if we could simply have an idea of what is on the other fellow's mind, what his real problem is, how he has solved it or tried to solve it, and where additional help may be needed. We do not make any promises to furnish immediate solutions to the multitude of problems that may beset the fruit-grower at the present time, but we will be glad to lend a hand where we can, and to pass on the striking successes or unsolved problems of our readers, to the balance of our circles where the greatest good may be secured. In other words, during the coming months we shall be especially glad to have the full co-operation of our readers in getting only the liveliest matter into this column, and also the matter in which they are now most vitally interested.

If therefore you have been able to do something out of the ordinary or have seen some one else do something in our line a little better than before—whether it be in getting out the borers, making or applying sprays, or in beating the general slump in prices—let the balance of us hear about it, together with any queries about matters that you may also desire some assistance on, and the proper steps will be taken to make the most possible out of it. It is said that adversity or necessity is the mother of invention. In that case, we ought to have a lot of new schemes or revision of old ones cropping out in the fruit-growing profession that would be of interest to all of us.

Quantity of Fruit in Cold Storage

Those who still have apples to sell will be interested in the recent report to the effect that the quantity of apples in cold storage on December first was greater than in any recent year, being the equivalent of 6,748,362 barrels as against 5,922,879 barrels a year ago. This looks like a big increase, but as a matter of fact it is only about 14 per cent more fruit than last year, while the decrease in price to the producer is fully 40 to 50 per cent. This decrease in price should be ample to move the relatively small increase in supply, if it were not for the fact that the peculiar state of mind which is largely responsible for the general slump in other lines were not also in full operation in the fruit market.

In other words, the general public has become thoroughly saturated with the idea that there is now a big surplus of everything, together with a limited amount of credit at the disposal of the holders, so that whatever they want is likely to be lower, hence why should they be in a hurry about buying? This of course does not apply in full to a perishable product like fruit, but until the present general impression is corrected, we can expect a very slow movement of fruit even at the greatly reduced levels.

If the decided value of fruit in lightening the average, too-heavy diet were fully realized, there would be no question whatever about the farmers in his neighborhood that the grain farmers were offering as high as \$4 a day and board for corn cutters and huskers, one of these men decided

that something drastic had to be done. He therefore cleared up his extensive packing house for the temporary storage of picked fruit, coopered up his barrels, set a price of 40 cents a barrel for picking, and centered all activities on the picking until it was out of the way, after which he took up the packing and grading of his fruit at comparative leisure.

Incidentally, he left the fruit out over night in most cases, so as to get the benefit of the cooler air and also to give the force suitable employment in the early mornings when it was frequently too dewy or foggy to pick without injuring the looks and "finish" of the fruit. In this way he had no trouble at all in securing an ample force to get all his apples picked and under cover before any serious frost occurred.

The other grower, with a still larger acreage, had adopted the plan of pitching camp right in his orchards, where he furnishes both eating and sleeping accommodations for all the men desired during the entire period. With the aid of a little judicious advertising he then gets the men in from all directions, and keeps most of them there until he is done with his job. This year he paid \$3 to \$3.50 a day and board, for most of his men, and also maintained a lecturer and a movie show about three times a week for their benefit. The cooks are real specialists in their lines, and altogether everybody seemed to be satisfied, even under the general conditions obtaining this fall, which is saying a lot.

Uncle Ab says: Only a lazy man wants an easy job; the hard jobs are the ones worth doing.

It's not too early to get garden and nursery catalogs for the planning of next year's fruit and garden crops.

ultimate cleaning up of all the fruit now in storage. Here is a food opportunity for all of us to serve both our own and humanity's interests, in spreading the gospel of more fruit in the diet.

GROWING RHUBARB IN THE CELLAR

The first and all important requisite for success in forcing rhubarb in the cellar is the root supply; young plants are useless to experiment with also debilitated plants as they are of no value and should be reset and allowed to form new roots. Vigorous plants only, are to be depended upon.

By attracting the attention of the gardeners, to the forcing of rhubarb, it has been my pleasure to see the work taken up and verified not only by commercial growers but by the state experiment stations as well.

No other vegetable takes the place of the apple so often as does rhubarb, and considering the ease with which it can be grown, there is no reason why every family, either in city or country, should not have an accessible supply at all times, from January until the latter part of April as the only requirements of the forcing place are freedom from frost and absolute exclusion from daylight. This last point must be heeded as light injures the color and quality, causes crooked stalks and expands the blade of the leaf; lamps or lanterns can supply the necessary amount of heat, the globes of which have been smoked black to modify the light. The construction of the floor is immaterial, but the better plan is to cover it with from three to five inches of good soil, and set the clumps closely together, filling up the space with the same soil, if the entire surface is covered, only enough should be used to level the top, which makes watering easier.

Rhubarb in the forcing house will stand any temperature from freezing to 98 degrees or more, and should the lights in the lamps go out and the heat run down, it will do no harm but of course a steady heat will bring the crop more quickly. Lower than sixty will cause slow growth but give stalks of good quality, while above that temperature will make rapid growth and stalks of less solidity.

A box placed by the cook stove will grow rhubarb nicely, but of course only a small amount can be grown at a time, and in this case the heat from the stove will be sufficient. The only care required will be to water occasionally and keep the roots covered from the light. Where space is limited, the stock can be replaced by fresh stock as soon as their bearing season is over. In fact, it is a good plan to take them out and store them as soon as the stalks become feeble and sprinkling for they will grow until they die. After forcing, store the roots in a cool place, and if they freeze it will do no harm, as it must be borne in mind that the roots must be solidly frozen before any attempt is made at forcing them. I hope every reader of this article will try forcing a few hills of rhubarb and see how you will like it, as well as how much money you can make.—C. A. Umosselle.

Uncle Ab says: Only a lazy man wants an easy job; the hard jobs are the ones worth doing.

It's not too early to get garden and nursery catalogs for the planning of next year's fruit and garden crops.

Superior The Even-Seeding Grain Drill

BUYING a Superior Grain Drill is the best long-life implement investment you can make. For over 50 years the work of the Superior has been the recognized standard of good seeding. Superior Drills seed evenly—all the time. They plant every seed at an even depth and at an even space. Every furrow opener makes a perfect, roomy trench and then properly covers the seed.

For Team or Any Tractor

THE Superior is built for good work and long, hard service. Simple in construction—and extra strong where strength is needed. It is extremely light of draft—easy on team both on hillsides and in heavy soils. It is the drill you need on your farm.

SUPERIOR Tractor Drills have an adjustable hitch for use with any tractor, and a special power lift that enables the operator to raise or lower the discs without leaving the tractor seat. Your dealer will be glad to show and explain all special features.

Of Interest to Farm Women and Girls

Standards for the New Year

Do not let the Hard Work and Disappointments of the Past Discourage Efforts for the Future

AS THE year 1920 recedes into the background are we satisfied with the records of its use in the farm homes of the country? What have we left to remember its passing by?

Many, in fact, most of us, must credit to 1920 unusual hardships, overwork, disappointments in rewards and other unpleasant data. Few of us have seen the long desired home improvements installed. The matter of labor scarcity alone has been a big handicap in the work of farm and home improvement.

Yet shall we despair of these good things and join the posts that are marching into the cities? Perhaps the only way to get the coveted home conveniences may seem to be to remove to the city where the matter

The Old Cupboard as it Looked in Our First Home

of installing a bath room is comparatively simple with the city water mains and sewer lines in the street in front of the house.

By all means do not let us forget the many intangible rewards there are in life in the country for those who like life in the open—independence of thought and action, high thinking and clean living. "All things come to him who waits." As the city man, minus a job or laid off about two to three days a week, casts about for means of recouping, the farmer isn't so badly off as he might be, if he can only be content for a

Baby's Clothing Chest Was Made Out of the Top of the Old Cupboard

time with inconveniences and with apparent injustice in return for hard labor.

While we are sitting tight and doing our level best to strengthen and

develop all the various farm co-operative agencies in the country, to which producers and consumers alike must look for future relief from old-time haphazard-lazy-grab-as-grab-can methods of distribution of foodstuffs let us take inventory of things near at hand out of which we might derive much more real benefit and happiness.

Are we neglecting culture in the farm homes? By this I mean not the culture born of schools which is in a sad state, and which is one of the crying shames in the country today. That is a story in itself—and one that is going to be "manhandled" soon in New York state by the committee of twenty-one that is getting under way for big things in the line of rural education.

I mean the use of books, papers and magazines in the farm homes. How many really good things are to be found year in and year out on our reading tables and book shelves? Is the farmer himself getting the right help and inspiration that is to be had from the large number of farm papers that are offering him such wonderful service today? I would class this kind of reading as the most important of any for any farm family today, as it caters to the needs of every member of the family and adds to their efficiency, their health and their content and happiness.

Are there children or young folks? If so, are we giving them at least one of the several valuable magazines arranged especially for their tastes, and for the shaping of their very destinies today? If not, let us not postpone an order for some of these at the first opportunity.

Of course the thinking farmer and his wife need at least one, and better two or more good daily papers, that they may keep in touch with civic affairs, with the markets, and the affairs of the government and the world at large.

The writer's family would feel lost without one or more of the weekly and as many of the monthly magazines that are noted for wise editorial comment, on affairs of the day, for feature articles and biography, for stories of life in the great world of industry.

You say you cannot find time to read. Enough time is mispent on the average farm to make the residents on that farm well informed men and women. Mind, I do not say spent in idleness, but too often spent in a misdirected fashion. We are daily almost hourly at times, faced with the need of making a right choice as to activity.

Do we always choose aright? Which is more desirable, a house immaculate in all respects at every minute of the year round, or a mind that is well equipped and well furnished with knowledge of the best things of life?

Given no schools or colleges at all the young people of today and their elders as well can be really well educated men and women if they will make the right use of books and pa-

pers. I prefer to sacrifice a new coat, hat or dress on occasion to sacrificing the furnishings of my reading table, which have so much to do with the mental, moral and spiritual food for my family.

And then our friends. Farmers have gotten to thinking they can't afford to have friends, to take time to visit or confer with them; to extend the graceful little courtesies and tokens of affection that are so dear to those who have known us long. We cut short the time devoted to the making of new friends. Indeed as we grow old we find the making of new friends not so simple a matter as it has been.

As 1921 comes along with its manifold duties let us hold close our friends. Let us cherish them as one of the richest things of life—Let us turn our faces to the wall awhile and think things over. Don't let's wait until July to take inventory. We won't do it then.

This is a good time to take stock of things, to make plans for the future. If there are things to be done it is a good thing to set a time limit. Without it we are apt to see results that are disappointing.

And in our plans for the New Year do not let us forget what we owe our Creator, in time, in money, in service. Especially if there are young people in the family let us be particularly careful in the ideals we set before them. For, as a noted educator of the day says, "All the problems of the world will be settled, and there will always be someone to

The Lower Part of the Cupboard Made This Handy Buffet

come forward to do the world's work, if we make every boy and girl into the best kind of a man or a woman."

In all our plans culture or development, let us make daily study of the Bible the cornerstone. We need to be so careful what we do, what we teach. Christ says "Whosoever shall break one of the least Commandments and teach men so to do shall be called least in the Kingdom of Heaven."

—A Farm Woman.

TWO PIECES OF FURNITURE OUT OF ONE

We have from time to time seen in the household department of the Pennsylvania Farmer directions for making over things to serve in the most practical way. Now I venture to tell you what we did with an old cupboard that looked like the one illustrated.

When we were married we came to a cupboardless house, and we used this cupboard. We kept our groceries in the top portion, in which there was a shelf. In the bottom part we kept our pots and pans. This part also had one shelf. This cupboard was made of wood, with the sides perforated in some sort of a design, as illustrated. The sides were painted green, but the rest of the cupboard had a golden oak finish.

When we moved into another home which had cupboards, we did not need this old one, so husband sawed off the upper part just below the long double doors, and just above the small drawers. Then he put the top on the cupboard on the lower just above the small drawers, as you see in the second figure. Then he sawed off a broom handle so that it was just as long as the cupboard, and fitted it on, by means of three supports, to the back of this lower part of the old cupboard, thus making a rack against which I lean four nice plates. Then he sandpapered and finished the cupboard, and I have a handy and good-looking buffet for my dining-room, at very little outlay. I keep my tablecloths on the shelf behind the double doors, D. D.

Husband next took the double doors off the upper portion of the cupboard, and used them for top and bottom of the shirtwaist box shown herewith. For the front and back sides he used the perforated paneling. For the two ends of the box he used the 1-inch material from the back of the old cupboard, making it two-ply around the edges, as illustrated, in order to get the panel effect. This box was then painted with two coats of white enamel inside and out. When our little daughter was about to arrive, this dainty box became the receptacle for her little garments as they were finished, and is now referred to at our house as "baby's chest."

—Mrs. Lillian Carr, Wayne Co., Pa.

STOP! LOOK! LISTEN!

"You cannot buy back the past; no matter how much of the future you are willing to pay for it."

Did you ever write a sentence with an indelible pencil and then wish to erase it? Probably. But it cannot be done, no matter how hard you try.

So it is with life. You cannot erase the words, the acts, the deeds. Once said, once done, they are the same as the indelible sentence.

So let us all form high ideals, lofty thoughts, and act sanely and wisely. Is it not much better to look back on a past full of the acts of our "best" selves, rather than one grinning implicitly at us; tell of lack of self-control, lack of restraint, and lack of wisdom?

Stop, look and listen! when in doubt as to the better course to follow along the roadway of life. There are the two roads; one leading straight as an arrow to health and happiness; the other, a muddy, murky, rocky road leading to tired, fagged nerves and a restless conscience.

When in doubt: Stop! Take time and consider if you are undecided. Look at the prospect from all angles. Is it going to bring you any lasting peace and happiness? Or merely a transient pleasure, with no particular good for any concerned. If so, why waste your time, thought and energy? Save them for something worth while.

Look! Does the prospect loom up brightly in your mind's eye? Or does it leave a muddy, doubtful little puddle, with no gleam of sunshine? Is the "adventure" you are going to have one that would bear the light of day? And that you would go home and tell the "folks" about? One that you would store up in your mental treasure box for future generations? If not, why have it? There are so many real adventures in life. Why not have only them?

Listen! To the words of those older and wiser. They will be glad to tell you their honest opinions with no reservations. With added years

come added foresight and knowledge. Why not heed their advice? It is valueless.

If, at the end of the journey, the slate is white and clean, there will be no regrets. There will be no desire to buy back the past, so that it might be lived again—differently.—Helen Gregg Green.

The man whose wife knows how to work over into appetizing dishes the smallest scraps of food left from meals has just cause to be thankful in these days of high-priced food-stuffs.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3352.—Pretty One-piece Dress for Girl.—The pattern is cut in 3 sizes: 12, 14 and 16 years. A 14-year size will require 3 yards of 38-inch material. Made of wool fabric, the ornamentation could be done with braid or beads. Pattern, 10 cents.

3405.—A Stylish Gown.—The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inch bust measure. A 38-inch size will require 5 1/2 yards of 36-inch material. The width of the skirt at lower edge with plaits extended is about 2 yards. This is an excellent model for crepe de meteor, crepe de chine, velveteen, satin, taffeta, serge, tricotine, divoyn and gabardine. Braid, fur, pipings, lace or embroidery may serve for decoration. Pattern, 10 cents.

3420.—Accessories for Suit or Gown.—The pattern includes all these attractive styles. It is cut in 3 sizes: small, medium and large. No. 3 will require 7/8 yard. No. 5 will require 1 1/2 yard. No. 1 will require 1 yard for collar, and 3/4 yard for the cuffs. Pattern, 10 cents.

3428.—Quaint Little Dress for Little Girl.—The pattern is cut in 4 sizes: 2, 4, 6 and 8 years. A 4-year size will require 2 1/2 yards of 27-inch material. Challie, all-over embroidery, voile or batiste, taffeta or china silk, serge, albatross and gabardine, also linen, and gingham may be used for this style. Pattern, 10 cents.

How About It?

Are you going to install a modern water supply system this year, or will you be obliged to pump and lug water by hand for another year?

THERE'S a lot of convenience to be had from a Hoosier Water Supply System. It benefits every member of the household, eliminates drudgery, and provides a worth-while comfort.

Any form of power may be used for operating a Hoosier System—gasoline engine, electric motor, or windmill. We supply motors which will operate from farm lighting plants. Hoosier Systems are easily installed and easily operated.

HOOSIER Water Service

The interiors of Hoosier water service tanks are treated with a rust resisting preparation, which prevents rust and water contamination.

Send today for Bulletin P and become acquainted with Hoosier Systems.

A Syracuse Plow for Your Soil

NO matter what the conditions are on your farm, whether your land is wet or dry, level or hilly, or whether the soil is sand, gravel, clay or loose loam, there is a Syracuse plow to meet your every problem and do your work perfectly.

JOHN DEERE SYRACUSE WALKING PLOWS

Fifty years of successful plow-manufacture stand behind Syracuse Plows. The results of careful investigations of your plowing problems built into Syracuse Plows by men old in plow-building experience, have given the Syracuse line well-earned leadership. The man who owns a Syracuse Plow knows what real plow value is.

Syracuse Plows do good work after long usage as well as when new. Wearing surfaces are chilled deep and uniformly by the special Syracuse process. Shares are chilled on under side of cutting edge as well as upper side.

Beams are guaranteed not to bend or break. All parts, whether originals or extras, fit perfectly, and are made absolutely true to pattern design.

See the Syracuse line of plows at your John Deere dealers. Write today for folders and the 114-page book, *Better Farm Implements*, which describes the full line of John Deere tools, and tells of their care and operation. Address John Deere, Moline, Illinois, and ask for Package SW736.

THE OUTLOOK

If any business is to attract the young manhood and womanhood of the country it must present a bright outlook to them. A young man goes to college for the purpose of preparing himself for some position that looks attractive to him. And the colleges save no space in their catalogues showing to the prospective student the high salaried positions that are open to him when he has completed the course in their college. The student who takes an engineering course hopes some day to be able to build a big bridge, a tunnel, an irrigation dam, or perhaps a Panama Canal. He looks forward to the opportunity for achievement. The student who pursues a classical course looks forward and sees himself as a minister preaching the gospel to a dying world, or perhaps, as a man of letters. And so on no matter which way we look, we see the young manhood and womanhood of the country directing their energies towards the accomplishment of some great task.

But what of the position of a farmer? What of the life lived out in the country where freedom has not been adulterated by the artificial tenets of society. Is there no outlook for achievement here, no financial reward, or opportunity for one of ability to become a man among men? Is there nothing for a woman but a life of hard work and drudgery? Has the farm no outlook for her? Must the farm always be a place for the growth and development of character and not for the exemplification of that character?

It is true that for those who are short on capital the farm offers a long hard struggle of self-denial before the point is reached where one may move with more freedom; but, though the task is hard, carefulness, industry, good judgment and self-denial will have its reward. However, I well know that too often this reward comes too late in life to be of much benefit, but it is thus with many of those in other walks of life. On the other hand, for those who come thru early enough in life to have many of their best years yet ahead of them there is now as there never was before opportunities for achievement and service to their fellow men which should not be overlooked or despised.

The pursuit of this opportunity for service and achievement lies in the great movement now getting under way for the complete organization of the farmer. The season of talking is about over and something definite and tangible must come into being. Old prejudices must be given up and farmers must come together in community organization with a national scope, first, then commodity organization both locally and nationally. Happily, we need not wait for the first kind or community organization. The Grange, which for more than fifty years has stood the test of time and fought and won more battles for the farmers than any other organization that has yet come into existence, is already here with full equipment of machinery to do the farmers' will. If only more farmers would lay aside their prejudices and join with their neighbors in strengthening and financing this self-help organization to the point where its voice could not be denied. The day is coming in Pennsylvania and in the nation when the farmers must step out and show by their support just what kind of an organization they wish to represent them. And may I suggest that in my judgment the only

one that will benefit the great body of farmers is the one fully financed and officered and supported by the real dirt farmers of the nation.—V. Ross Nicodemus, Bedford Co., Pa.

ELECTRICAL PLANT A SUCCESS

Since I had an electric water system installed I have always found that a supply of running water anywhere I want it is one of the most valuable things on my farm.

The system is operated by my electric power and light outfit and automatically starts when the pressure in the tank lowers to a certain point and stops when it raises to another. That saves me the trouble of operation, as well as lot of time I would otherwise have had to take to pump the water by hand and it saves me countless steps carrying pailful after pailful of water required for household uses, and for my horses and livestock.

Besides this daily saving, running water at the barn saved me considerable expense when I filled my silo in October.

My corn was very dry, making it necessary to add water in order to keep it in good condition. Here is where my electric water system stood me in good stead; the little pump drew water from the bottom of a forty foot well and distributed it at my barn 300 feet distant. Then it forced the water up about 25 feet into the silo. Some pump, I'll say.

It saved me the services of a man and team. Without my water system I would have had to use a team to haul the water and a man to pump it at the well and empty it in the silo.—W. E. S.

IF YOU CAN'T TRUST HER, DON'T MARRY HER

I was greatly interested in the article "The Business Farmer's Wife" and I wish all farmers and their wives could and would read it.

If a man thinks his wife is so stupid she couldn't possibly comprehend his business and there is no use telling her about it, why on earth did he marry her? He may die before she does and what will become of their business then? A widow with no knowledge of the firm's business is certainly in a bad fix. Is it any wonder that many lose their minds?

How few men, comparatively, ever consider their wives as partners in all? Often she is housekeeper, cook, and a sort of "handy man" about the place but when it comes to money matters she is counted out entirely. This, I believe, is less frequently the case in these days than formerly, but it is still by far too common. Some men honestly think their wives are busy enough without bothering with business, but these men are not the ones who scrimp the spending money. Far more men keep their business strictly to themselves because they have no intention of sharing their money with the other member of the firm—her share consists exclusively of work. I know a sweet little woman with no end of work to do whose husband refused to buy her any shoes because the price didn't suit him. If such instances were not common why would the question of "pin money" for farm women exist at all? It never did at our house; as long as my husband lived he always gave me far more money than I spent or had any need of spending. I had free access to his purse and his bank book and was told to help myself. If a man can't trust his wife he should have bid her "adieu" before she became his bride.—Mrs. A.

"The use of a truck on Goodyear Cord Tires has enabled me to release three teams and three drivers from threshing work and is shortening the length of my harvesting season three to four weeks, thus helping the thresher to finish the job while good weather lasts. The pneumatics roll easily over plowed fields, through stubble, barnyard mud, snow and so on. At 12,000 miles, they look good for 12,000 more."—Carl J. Gustafson, Owner of Willow Grove Farm, near Aberdeen, South Dakota

MORE and more farmers constantly are reporting, as above, marked benefits obtained from motorization and particularly from motor trucks on Goodyear Cord Tires.

They have found that quick field hauling assists power-machines by prompt supply and removal of loads, and that the pneumatics make such hauling possible.

A sturdy truck on Goodyear Cord Tires, therefore, is of vital aid to year 'round motor-farming; to motorized pumping, spraying, threshing, silo-filling, feed-grinding and other work.

Pneumatic traction overcomes soggy, slippery going; pneumatic cushioning prevents severe shaking and loss of load; pneumatic activity saves much time.

By the development of the rugged Goodyear Cord construction, all these advantages of the big pneumatics have been made most intensely practical for farm service.

Farmers' accounts of how motorization and pneumatics have saved labor, crops, time and money, can be obtained from The Goodyear Tire & Rubber Company, Akron, Ohio, or Los Angeles, California.

GOODYEAR CORD TIRES

"U. S." Boots—Reinforced where the wear is hardest. Made in all sizes and styles—Hip, Half-hip, and Knee. In red, black and white

Backed by 74 years of experience

Built of rubber from our own plantations—the "U.S." Boot

SEVENTY-FOUR years of expert manufacture—years of careful research and constant improvements—are behind this U. S. Boot.

Wear — comfort — appearance — it has them all!

Built of the finest quality rubber from our own plantations—modelled on scientifically designed lasts—shaped by expert workmen who take real pride in the finished product—these are the reasons why farmers everywhere should get U. S. Boots whenever they buy.

Reinforced where the wear is hardest

1. The Sole—Five soles in one, all of the finest rubber.

2. Back of the Heel—Every step you take puts a strain on the seam in back. At this point every U. S. Boot is reinforced with *ten thicknesses*.
3. The Toe—Has three heavy layers, a special toe-cap, and an extra sheet of highest quality rubber on the outside.
4. The "bend" in front—A boot has no lacing in front to "give" as you walk. Every step you take, the rubber bends and buckles. Six heavy thicknesses give long wear to U. S. boots at this point.

The U. S. Boot is built layer by layer carefully and skilfully, then welded into *one solid piece*.

The U. S. Boot is just one type in a complete line of rubber footwear to meet every need on the farm.

A new kind of overshoe for farmers

All the warmth and convenience of a cloth-top arctic, as watertight and easily cleaned as a rubber boot—that's the new U. S. Walrus.

It's an all-rubber, buckled overshoe that you can slip on and push off in a moment. It has a warm, fleecy lining—and its smooth rubber surface is absolutely watertight. Best of all, you can clean it instantly under a faucet or at the pump while it's still on your feet. It will keep your shoes clean and the house clean, too.

A watertight shoe for all-round wear

The U. S. Bootees give you the protection of a boot with the comfort of a shoe. They slip on over your socks like a leather shoe. You can wear them all day long in mud and water—your feet will stay dry and comfortable.

"U. S." Bootees—Worn over the sock like a leather shoe. An all-rubber surface—easily washed off. Hy-Bootee, six eyelets; Lo-Bootee, four eyelets. In red, black and white

"U. S." Rubbers—A wide range of models, in light and heavy styles to meet every need. Made in all sizes, for men, women, and children

Other types of "U. S." Footwear—built for rough service

The U. S. line of footwear has a type for every need—arctics, rubbers, "overs"—all built in the same rugged, reliable way.

They all have tough, heavy soles—special reinforcements at every point where the wear is hardest—and the highest quality rubber.

Ask your dealer to show you his U. S. line. Pick out the type best suited to the work you do. Every one has been designed by experts—every one is backed by over half a century of experience.

Always look for the U. S. Seal—it means solid wear and long service for your money.

"U. S." Walrus—an overshoe with an all-rubber surface that can be cleaned instantly. Warm as an arctic. Absolutely watertight. All weights and sizes. In red, black and white

POULTRY

WHY PULLETS DO NOT LAY

If you were constantly knocking around among farmers where poultry is a considerable source of revenue as I am perhaps you would realize as I have realized the necessity of getting the chicks out early. In doing culling work thru the combelt I seldom find a farm flock which can be said to be profitable where the chicks are not gotten out in March or at least by the first week in April. This is especially true of the larger breeds such as Reds, Rocks, Wyandottes and Orpingtons of which most farm flocks at the central west are composed. And I find the most profitable of all of these are found where the chicks have been gotten out at one or at most two hatches.

Although the April hatched Leg Horn will mature in time to start laying before cold weather sets in the larger breeds hatched in this month, particularly after the middle of the month, will seldom begin to lay much before January under the methods of handling practiced on the average farm. It is a regular thing to find weak pullets in the fall when three or four hatchings have been made in the spring. The latter hatches are almost invariably left to run with the early chicks and altho two hatches made three weeks apart get along fairly well when they are large enough to leave the brooder, there is a vast difference between chicks six weeks or more old. The earlier ones naturally grow faster, beg the feed and continually worry the younger chicks and their growth is consequently set back. The older chicks usually have the advantage of fresh ground, get a larger proportion of the natural supply of animal food in the shape of worms and bugs and have more succulent green food on the range.

From November until late December I am constantly being asked to call and cull flocks because they are laying no eggs and their owners are under the impression that they have a lot of slackers on their hands. Except where such culling is done from the standpoint of selecting breeding birds I discourage culling at this time to any considerable degree. Culling should be done between August first and December first to be of most worth in eliminating the slacker hen and the later cullings primarily to make a better selection of birds from which eggs are to be hatched.

The reason no eggs are had at this time of year is simply that the old hens are taking a seasonal, and perfectly normal rest. November and December are not normal producing months for hens. Pullets must be depended upon at this time to fill the egg basket and to keep it filled during the winter for the old hens will not normally start production much before the first of middle of January. But pullets often do not perform and the man doing private culling or the extension worker from the experiment station is asked to tell why.

Now in my own experience I have found that at least seven times out of ten it was simply a matter of immaturity among pullets. It is true that housing conditions and feeding methods and ration sometimes have something to do with the matter and

occasionally an especially poor laying strain of pullets is found. But all in all the late hatches can be blamed for most of the trouble. So if you expect November and December—in short any number at all of winter eggs—impress upon yourself that now is the time to prepare for them. No amount of culling, feeding or forcing will make up for mistakes made in failing to get the chicks out. Cull the old hens rather than the pullets and expect the latter to be the winter profit payers.

Most of us have been admonished to get our chicks out early until the saying seems trite but I assure you that nothing is more vital to putting the balance on the right side of the ledger than that very thing. So not only make a contract with yourself to do this thing this spring but provide the necessary hatching capacity and brooder room to get out all the chicks you are going to need in two hatches if you can or at most three. And if you do run three start the first one early enough so the last one will come off not later than the first week in April for the general purpose varieties and be sure to provide separate ranges for at least the last batch of chicks.

All of your Leghorns or other light breeds may be hatched in April with a very fair promise of success and it is a big help both in caring for the chicks until they go into the laying house in the fall and in feeding them afterward to have the pullets as near the same size as possible. The fact that you have done very well with late hatched chicks should not mislead you for nine times out of ten such cases are the exception and prove merely that a lot of work was put in in caring for the chicks or that the owner was exceptionally lucky or both so if you want full egg baskets at the time the old hens are taking their yearly rest provide for it by getting out a sufficient number of pullets that will mature before cold weather starts.—W. C. Smith.

SELECTING VIGOROUS CHICKS

The chick with the big bright eye and the short stout beak is apt to be more vigorous than the dull-eyed chick with the beak that appears longer. In some cases the beak of the weak chick will seem long because the head is undersize and droopy. Note a flock of skillfully managed brooder chicks that are growing rapidly. Their beady eyes fairly sparkle with life.

The best day old chicks will have a medium long and broad back without suggestion of the undersized runt. The fluff will be rounded out and glossy. The shanks and toes will appear sturdy and stocky suggesting vigor and ability to scratch for a living. The wings should be well folded. This seems to be a mark of vigor at all ages. When the wings of the growing chicks are strong and tightly folded to the body those chicks seem to be making an even thrifty growth. We do not like to see the wings of chicks get too far ahead of the bodies and tire out the chicks from carrying them around.

Incubators now do their work so well that the breeding stock or the poultryman are to blame if chicks are puny and dull.—R. C. Kirby.

RUST'S EGG PRODUCER

Makes Hens Lay Winter Eggs

Mix RUST'S EGG PRODUCER with their daily ration. Soon you have crackling red round chickens laying more and more eggs each week.

RUST'S EGG PRODUCER tones up the egg producing organs. Used by professional poultrymen for thirty years. If your dealer can't supply you, send us his name and \$35 and we will send you postpaid 1-lb. trial package.

Beware of Roup

One ounce of prevention is equal to a pound of cure. RUST'S ROUP POWDER keeps healthy in the drinking water of the flocks during the Fall and Winter months will keep your flocks free from this dreaded disease.

Make 'Em Lay

Get thirty to forty percent more eggs from the same flock by feeding SEMI-SOLID BUTTERMILK. Numerous experiments absolutely prove that your egg yield may be increased by feeding this wonderful food and tonic for poultry.

Semi-Solid Buttermilk

(A Tonic as well as a Feed)
Semi-Solid Buttermilk is a highly nutritive poultry feed and the best tonic and conditioner. Contains no injurious preservatives. Stays fresh indefinitely. It will keep your hens laying all winter. Be sure to get the genuine Semi-Solid Buttermilk. Write or order today.

EUREKA Colony Brooder

Use it 30 days at our expense. You take no risk. Burns coal or natural gas. Easy to operate.

(Continued from Page 3).

good protein content. The rows were very straight running from butt to tip.

Market Condition

This factor, strange as it may read to the eastern farmers is why more of our corn failed to place than for any other reason. This I particularly noted was the case with the samples exhibited from Pennsylvania, Delaware, Maryland and Virginia. The western states having realized the necessity of market condition in judging show corn several years ago.

If the grain is loose on the cob, do not put the ear in your sample as one loose ear will 'kill' the sample. The grain on each ear must be solid and the germ bright when cut open. There was not more than four samples from the East that showed good market condition as every other sample had one or more loose-grain ears. I appreciate the fact that the grain always dries faster than the cob and this causes the grain to temporarily loose until the cob dries. But after this happens the ear will be from one-quarter to one-half inch shorter and under all probability will not fit in your sample so as to retain uniformity of length. Therefore, the judges realizing this, discard your sample. Again these loose grain ears are an evidence that you grow a variety too late in maturing for your locality, and in a short season it would fail to mature. Therefore, show ears solid and in good market condition.

Points of Perfection

What constitutes a perfect ear? In order to pick a good sample of corn for exhibition we must always bear in mind what constitutes a perfect ear. According to the present score card a perfect ear is one containing twenty rows of grain and each row running straight from butt to tip; length of ear, ten to ten one-half inches; circumference, seven one-half to seven three-quarter inches, one third distance from butt of ear, and the ear must be cylindrical, or only slightly tapering from butt to tip.

Adaptability of Exhibit to Region Where Grown

This factor perhaps does not count so much in the show game as the other points mentioned. However, it does count often in placing an exhibit of small corn over an exhibit of larger corn where they are grown in two distinct regions, the number of days in the growing season being different but are competing in the same class. The judges realize that a sample of corn grown in a region having 120 days for growing should not be as large as a sample grown in a section having a 140-day growing period. Therefore, pick an average-size sample for your section, one not too large or too small, in an effort to bring out some other points of perfection. The smoother and tougher types of corn count considerably here as the shorter the growing season the smoother should be the corn.

In conclusion I wish to say this is of great importance to our eastern farmers and if we will only spend more time in selecting our show corn for exhibition I feel confident we can equal the exhibits of the corn belt. We have equally as many and as good show ears but we have failed to give the required time in selecting them.

The Healthy Cow, the Hungry Cow is the Business Cow

She's the cow that will convert her feed of grain and fodder into pails of milk. Remember, the better the appetite, the greater the food consumption, the greater the milk production. Hence, good health, a strong appetite and good digestion are the absolute essentials of a big milker.

Dr. Hess Stock Tonic

Keeps cows healthy. It makes cows hungry.

It contains Nux Vomica, that greatest of all nerve tonics. It whets the appetite, brightens the eye, invigorates the system. It contains Quassia, that bitter Stomachic tonic that produces appetite. It contains Iron that helps to replenish rich red blood, so essential to a cow in milk.

Lastly, but just as important is it—it contains Laxatives and Diuretics that cause the kidneys to filtrate and the bowels to operate regularly, so as to throw off and carry off the waste material. There is no clogging of the system where Dr. Hess Stock Tonic is fed.

Good alike for cattle, horses, hogs and sheep. It keeps animals healthy, the whole herd thrifty. It expels worms. Always condition your cows for calving with a course of Dr. Hess Stock Tonic before freshening.

Dr. Hess Stock Tonic is compounded strictly on scientific lines. You buy it according to the size of your herd. Tell your dealer how many cows you have. He has a package to suit. We guarantee good results in the milk pail.

25 lb. Pail, \$2.50

100 lb. Drum, \$8.50

Except in the far West, South and Canada. Smaller packages in proportion.

TALKS WITH THE BOYS

THE EDITOR'S LETTER

To the Boys:

Well boys, what is your opinion by this time about our department? Is it worth while? Of course, I have not had time yet to hear from you and so, for this week again, I will have to do most of it myself. After this week I am sure I will have received letters from some of you. No doubt some of them will be good to print while others will give me suggestions on what to talk about. Some day we will have a talk on how to write a good letter. One of the first rules about writing for publication is to write on one side of the paper only; another is, leave a margin down the left hand side of the sheet.

I received a letter the other day from a grown-up, urging me to start a campaign for the preservation of birds. He said that people should study birds more and be willing to give some attention to feeding them during the winter and to furnishing them with nesting places in the spring. That is a good thought. Boys, do you realize how much depends upon the work of birds? It has been said that if all birds should die this country would become a desert in three to five years. Insects would kill all kinds of vegetation. Did you ever try to see how many different birds you could identify by sight or song? I find that most of us grown-ups don't know much about birds, and I doubt if grown people will take up the question seriously. It will depend upon the young people, since their eyes are keener and their memory of sound better. I am sure we will have something from time to time that will be interesting and also teach us how we may help in preserving the bird life about our homes.

I hope you are all taking a real interest in your school work and that no boy under sixteen years of age is staying out of school. If any of you are doing so, will you not tell me why? The more of life I see the more I am convinced that no boy can afford to miss any opportunity to get a good education. I know that some boys think it is more manly to stay out of school and work, or maybe just loaf around. Boys, it's a mistake. You can't afford it. The day will come when every day missed will show up in your income. Don't be fooled by somebody's saying, "There's old Mr. So-and-so who never went to school and he got rich." That was possible to a few in the past, but it is not possible now.

But making money is the least of the advantages of an education. The intelligent man has more enjoyment in life. He is more useful in his community, and can render better service to his country. Now, I hope you will not think I am going to use this column for lecturing you, but there are some things we want to get straight at the beginning, and one of those things is that a good, keen, trained mind is a necessary foundation if you are going to build a life that is worth while. By a trained mind I mean a mind that is able to read understandingly, think clearly and see intelligently. That's what an education is—the ability to do these three things.

EULOGY ON THE DOG

The following is a plea which Senator Vest once made before a jury when a case involving a dog was being tried. It is said that spectators and jurymen broke down and wept. It is needless to say he won the case. Gentlemen of the Jury—The best friend a man has in this world may turn against him and become his enemy. His son and daughter that he has reared with loving care may become ungrateful. Those who are nearest and dearest to us, those whom we trust with our happiness and our good name, may become traitors to their faith. The money that a man has he may lose. It flies away from him when he may need it most. Man's reputation may be sacrificed in a moment of ill-considered action. The people who are prone to fall on their knees and do us honor when success is with us may be the first to throw the stone of malice when failure settles its cloud upon our heads. The one absolutely unselfish friend a man may have in this selfish world, the one that never deserts him, the one that never proves ungrateful or treacherous, is the dog.

A man's dog stands by him in prosperity and poverty, in health and in sickness. He will sleep on the cold ground, when the wintry winds blow and the snow drives fiercely, if only he may be near his master's side. He will kiss the hand that has no food to offer, he will lick the wounds and sores that come in encounter with the roughness of the world. He guards the sleep of his pauper master as if he were a prince.

When all other friends desert, he remains. When riches take wings, and reputation falls to pieces, he is as constant in his love as the sun in its journey thru the heavens. If fortune drives the master forth an outcast into the world, friendless and homeless, the faithful dog asks no higher privilege than that of accompanying him, to guard him against danger, to fight against his enemies; and when the last scene of all comes and death takes his master in its embrace and his body is laid away in the cold ground, no matter if all other friends pursue their way, there by his graveside will the noble dog be found, his head between his paws and his eyes sad, but open in alert watchfulness, faithful and true even to death.

GOOD HEALTH HABITS

Start the New Year with the resolution that you are going to do daily many little things that will add to your mental and physical welfare.

Let the other fellow do the worrying.

Hit the hay early—and regularly. Brush the teeth and rinse the mouth before retiring and again in the morning. You will appreciate the good condition of your teeth in later years.

Drink plenty of water daily—an excellent precaution against future ills.

Give more care to the choice of food.

Partake of fruit and vegetables daily.

Leave the flivver in the garage occasionally and walk.

The Voice of the Pack

by Edison Marshall

SYNOPSIS

Dan Pauling had just received from his physician the unenviable information that he had but six months to live. After desponding from a long line of hardy pioneers, his life had been spent in the city where confinement in an office had destroyed the physical foundation which his forebears had laid. He strolled out to the city park, seated himself on a bench where he made the acquaintance of a squirrel. The squirrel's antics awoke a latent love and appreciation for the things of Nature and he suddenly resolved to spend his last six months in the forests of the Northwest where his grandfather had lived. He acts at once upon this resolve and he is soon in the virgin forests of that great country. He is fortunate in becoming an inmate of a home owned by a man who knew and loved Dan's grandfather. A daughter, nicknamed Snowbird, is also a member of the family.

CHAPTER I—BOOK II The Debt

IT WAS true that in the two months Dan had spent in the mountains he had learned to be very receptive to the voices of the wilderness. Lennox had not been mistaken in thinking him a natural woodsman. He had imagination and insight and sympathy; but most of all he had a heritage of wood lore from his frontiersmen ancestors. Two months before he had been a resident of cities. Now the wilderness had claimed him, body and soul.

These had been rare days. At first he had to limit his expeditions to a few miles each day, and even then he would come in at night staggering from weakness. He climbed hills that seemed to tear his diseased lungs to shreds. Lennox wouldn't have been afraid, in a crisis, to trust his marksmanship now. He had the natural cold nerve of a marksman, and one twilight he brought the body of a lynx tumbling thru the branches of a pine at a distance of two hundred yards. A shotgun is never a mountaineer's weapon—except a sawed-off specimen for family contingencies—yet Dan acquired a certain measure of skill at small game hunting, too. He got so he could shatter a grouse out of the air in the half of a second or so in which its bronze wings glinted in the shrubbery; and when a man may do this a fair number of times out of ten, he is on the straight road toward greatness.

Then there came a day when Dan caught his first steelhead in the North Fork. There was no finer sport in the whole west than this—the play of a fly, the strike, the electric jar that carries along the line and thru the arm and into the soul from where it is never quite effaced, and finally the furious strife and exultant throb when the fish is hooked. There is no more beautiful thing in the wilderness world than a steelhead trout in action. He simply seems to dance on the surface of the water, leaping again and again, and racing at an unheard-of speed down the rapids. But now and again amateur fishermen without souls have tried to pull him in with main strength, and are still somewhat dazed by the result. It might be done with a steel cable, but an ordinary line or leader

breaks like a cobweb. When his majesty the steelhead takes the fly and decides to run, it can be learned after a time that the one thing that may be done is to let out all the line and with prayer and humbleness try to keep up with him.

Dan fished for lake trout in the lakes of the plateau; he shot waterfowl in the tule marshes; he hunted all manner of living things with his camera. But most of all he simply studied, as his frontiersmen ancestors had done before him. He found unceasing delight in the sagacity of the bear, the grace of the felines, the beauty of the deer. He knew the chipmunks and the gray squirrels and the snowshoe rabbits. And every day his muscles had hardened and his gaunt frame had filled out.

He no longer wore his glasses. Every day his eyes had strengthened. He could see more clearly now, with his unaided eyes, than he had ever seen before with the help of the lens. And the moonlight come down thru a rift in the trees and showed that his face had changed too. It was no longer so white. The eyes were more intent. The lips were straighter.

"It's been two months," Silas Lennox told him, "half the four that you gave yourself after you arrived here. And you're twice as good now as when you came."

Dan nodded. "Twice! Ten times as good! I was a wreck when I came. Today I climbed halfway up Baldy—within a half mile of Snowbird's cabin—without stopping to rest."

Lennox looked thoughtful. More than once, of late, Dan had climbed up toward Snowbird's cabin. It was true that his guest and his daughter had become the best of companions in the two months; but on second thought Lennox was not in the least afraid of complications. The love of the mountain women does not go out to physical inferiors. "Whoever gets her," he had said, "will have to tame her," and his words still held good. The mountain women rarely mistook a maternal tenderness for an appealing man for love. It wasn't that Dan was weak except from the ravages of his disease; but he was still a long way from Snowbird's ideal.

And the explanation was simply that life in the mountains gets down to a primitive basis, and its laws are the laws of the cave. Emotions are simple and direct, dangers are real, and the family relations have remained unchanged since the first days of the race. Men do not woo one another's wives in the mountains. There is no softness, no compromise; the male of the species provides, and the female keeps the hut. It is good, the mountain women know, when the snows come, to have a strong arm to lean upon. The man of strong muscles, of quick aim, of cool nerve in a crisis is the man that can be safely counted on not to leave a youthful widow to a lone battle for existence. Although Dan had courage and that same rigid self-control that was an old quality in his breed, he was still a long way from a physically strong

man. It was still an even break 'tween the vision had been whether he would ever wholly recover from his malady.

But Dan was not thinking about this now. All his perceptions had sharpened down to the finest focal point, and he was trying to catch the spirit of the endless forest that stretched in front of the house. The moon was above the pines at last, and its light was a magic. He sat breathless, his eyes intent on the silvery patches between the trees. Now and then he saw a shadow waver.

His pipe had gone out, and for a long time Lennox hadn't spoken. He seemed to be straining too, with ineffective senses, trying to recognize and name the faint sounds that came so tingling and tremulous out of the darkness. As always, they heard the stir and rustle of the gnawing people: the chipmunks in the shrubbery, the gophers who, like blind misers, had ventured forth from their dark burrows; and perhaps even the scaly glide of those most-dreaded poison people that had lairs in the rock piles.

Then, more distinct still, they heard the far-off yowl of a cougar. Yet it wasn't quite like the cougar utterances that Dan had heard on previous nights. It was not so high, so piercing and triumphant; but had rather an angry, snarling tone made up "ows" and broad, nasal "yohs." It came tingling up thru hundreds of yards of still forest; and both of them leaned forward.

"Another deer killed," Dan suggested softly.

"No. Not this time. He missed, and he's mad about it. They often snarl that way when they miss their stroke, just like an angry cat. But listen—"

Again they heard a sound, and from some far-lying ridge, they heard a curious echo. So far it had come that only a tremor of it remained; yet every accent and intonation was perfect, and Dan was dimly reminded of some work of art cunningly wrought in miniature. In one quality alone it resembled the cougar's cry. It was unquestionably a wilderness voice—no sound made by men or the instruments of men; and like the cougar's cry, it was simply imbued with the barbaric spirit of the wild. But while the cougar had simply yowled in disappointment, a sound wholly without rhythm or harmony, this sound was after the manner of a song, rising and falling unutterably wild and strange.

CHAPTER II

Dan felt that at last the wilderness itself was speaking to him. He had waited a long time to hear its voice. His thought went back to the wise men of the ancient world, waiting to hear the riddle of the universe from the lips of the Sphinx, and how he himself—more in his unconscious self, rather than conscious—had sought the eternal riddle of the wilderness. It had seemed to him that if once he could make it speak, if he could make it break for one instant its great, brooding silence, that the whole mystery and meaning of life would be in a measure revealed. He had asked questions—never in the form of words but only ineffable yearnings of his soul—and at last it had responded. The strange rising and falling song was its own voice, the articulation of the very heart and soul of the wilderness.

And because it was, it was also the song of life itself—life in the raw, life as it is when all the superficial

things that blunt the vision had been struck away. Dan had known that it would be thus. It brought strange pictures to his mind. He saw the winter snows, the spirits of Cold and Famine walking over them. He saw Fear in many guises—in the forest fire, in the landslide, in the lightning cleaving the sky. In the song were centered and made clear all the many lesser voices with which the forest had spoken to him these two months and which he had but dimly understood—the passion, the exultation, the blood-lust, the strength, the cruelty, the remorseless, unceasing struggle for existence that makes the wilderness an eternal battle ground. But over it all was sadness. He couldn't doubt that. He heard it all too plainly. The wild was revealed to him as it never had been before.

"It's the wolf pack," Lennox told him softly. "As long as I have been in the mountains, it always hits me the same. The wolves have just joined together for the fall rutting. There's not another song like it in the world."

Dan could readily believe it. The two men sat still a long time, hoping that they might hear the song again. And then they got up and moved across the cleared field to the ridge beyond. The silence closed deeper around them.

"Then it means the end of the summer?" Dan asked.

"In a way, but yet we don't count the summer ended until the rains break. Heavens, I wish they would start! I've never seen the hills so dry and I'm afraid that either Bert Cranston or some of his friends will decide it's time to make a little money fighting forest fires. Dan, I'm suspicious of that gang. I believe they've got a regular arson ring, maybe with unscrupulous stockmen behind them, and perhaps just a penny-winning deal of their own. Suppose you know about Landy Hildreth—how he's promised to turn state's evidence that will send about a dozen of those vipers to the penitentiary?"

"Snowbird told me about it."

"He's got a cabin over toward the marshes, and it has come to me that he's going to start tomorrow, or maybe he has already started today, down into the valley to give his evidence. Of course, that is deeply confidential between you and me. If the gang knew about it, he'd never get thru the thickets alive."

But Dan was hardly listening. His attention was caught by the hushed intermittent sounds that are always to be heard, if one listens keenly enough, in the wilderness at night. "I wish the pack would sound again," he said. "I suppose it was hunting."

"Of course. And there is no living thing in these woods that can stand against a wolf pack in its full strength."

"Except man, of course."

"A strong man, with an accurate rifle, of course, and except possibly in the starving times in winter he'd never have to fight them. All the beasts of prey are out tonight. You see, Dan, when the moon shines, the deer feed at night instead of in the twilights and the dawn. And of course the wolves and the cougars hunt the deer. It may be that they are running cattle, or even sheep."

But Dan's imagination was aflame. He wasn't content yet. "They couldn't be—hunting man?" he asked.

"No. If it was midwinter and the pack was starving, we'd have to listen better. It always looked to me as if the wild creatures had a law against

killing men, just as humans have.

They've learned it doesn't pay—something the wolves and bears of Europe and Asia haven't found out. The naturalists say that the reason is rather simple—that the European peasant, his soul scared out of him by the government he lived under, has always fled from wild beasts. They were tillers of the soil, and they carried hoes instead of guns. They never put the fear of God into the animals and as a result there are quite a number of true stories about tigers and wolves that aren't pleasant to listen to. But our own frontiersmen were not men to stand any nonsense from wolves or cougars. They had guns, and they knew how to use them. And they were preceded by as brave and as warlike a race as ever lived on the earth—armed with bows and arrows. Any animal that hunted men was immediately killed, and the rest found out it didn't pay."

"Just as human beings have found out the same thing—that it doesn't pay to hunt their fellow men. The laws of life as well as the laws of nations are against it."

But the words sounded weak and dim under the weight of the throbbing darkness; and Dan couldn't get away from the idea that the codes of life by which most men lived were forgotten quickly in the shadows of the pines. Even as he spoke, man was hunting man on the distant ridge where Whisperfoot had howled.

Bert Cranston, head of the arson ring that operated on the Umpqua Divide, was not only beyond the pale in regard to the laws of the valleys, but he could have learned valuable lessons from the beasts in regard to keeping the laws of the hills. The forest creatures do not hunt their own species, nor do they normally hunt men. The moon looked down to find Bert Cranston waiting on a certain trail that wound down to the settlements, his rifle loaded and ready for another kind of game than deer or wolf. He was waiting for Landy Hildreth; and the greeting he had for him was to destroy all chances of the prosecuting attorney in the valley below learning certain names that he particularly wanted to know.

There is always a quality of unreality about a moonlit scene. Just what causes it isn't easy to explain, unless the soft blend of light and shadow entirely destroys the perspective. Old ruins will sometimes seem like great misty ghosts of long-dead cities; trees will turn to silver; phantoms will gather in family groups under the cliffs; plain hills and valleys will become, in an instant, the misty vales of Fairyland. The scene on that distant ridge of the Divide partook of this quality to an astounding degree; and it would have made a picture no mortal memory could have possibly forgotten.

There was no breath of wind. The great pines, tall and dark past belief, stood absolutely motionless, like strange pillars of ebony. The whole ridge was splashed with patches of moonlight, and the trail, dimming as the eyes followed it, wound away into the utter darkness. Bert Cranston knelt in a brush covert, his rifle loaded and ready in his lean, dark hands.

No wolf that ran the ridges, no cougar that waited on the deer trails, knew a wilder passion, a more terrible blood-lust than he. It showed in his eyes, narrow and never resting from their watch of the trail; it was in his posture; and it revealed itself unmistakably in the curl of his lips. Something like hot steam was in his brain, blurring his sight and heat-

ing his blood.

The pine needles hung wholly motionless above his head, but yet the dead leaves on which he knelt crinkled and rustled under him. Only the keenest ear could have heard the sound; and possibly in his madness, Cranston himself was not aware of it. And one would have wondered a long time as to what caused it. It was simply that he was shivering all over with hate and fury.

A twig cracked, far on the ridge above him. He leaned forward, peering and the moonlight showed his face in unsparing detail. It revealed the deep lines, the terrible, drawn lips, the ugly hair long over the dark ears. His strong hands tightened upon the breech of the rifle. His wiry figure grew tense.

Of course, it wouldn't do to let his prey come too close. Landy Hildreth was a good shot too, young as Cranston, and of equal strength; and no sporting chance could be taken in this hunting. Cranston had no intention of giving his enemy even the slightest chance to defend himself. If Hildreth got down into the valley, his testimony would make short work of the arson ring. He had the goods; he had been a member of the disreputable crowd himself.

The man's steps were quite distinct by now. Cranston heard him fighting his way thru the brush thickets, and once a flock of grouse, frightened from their perches by the approaching figure, flew down the trail in front. Cranston pressed back the hammer of his rifle. The click sounded loud in the silence. He had grown tense and still, and the leaves no longer rustled.

His eyes were intent on a little clearing, possibly one hundred yards up the trail. The trail itself went straight thru it. And in an instant more, Hildreth pushed thru the brush and stood revealed in the moonlight.

If there is one quality that means success in the mountains it is constant, unceasing self-control. Cranston thought that he had it. He had known the hard schools of the hills; and he thought no circumstance could break the rigid discipline in which his mind and nerves held, his muscles. But perhaps he had waited too long for Hildreth to come; and the strain had told on him. He had sworn to take no false steps; that every motion he made should be cool and sure. He didn't want to attract Hildreth's attention by any sudden movement. All must be cautious and stealthy. But in spite of all these good resolutions, Cranston's gun simply leaped to his shoulder in one convulsive motion at the first glimpse of his enemy as he emerged into the moonlight.

The end of the barrel struck a branch of the shrubbery as it went up. It was only a soft sound; but in the utter silence it traveled far. But a noise in the brush might not have been enough in itself to alarm Hildreth. A deer springing up in the trail, or even a lesser creature, might make as pronounced a sound. It was true that even unaccompanied by any other suspicious circumstances, the man would have become instantly alert and watchful; but it was extremely doubtful that his muscular reaction would have been the same. But the gun barrel caught the moonlight as it leaped, and Hildreth saw its glint in the darkness.

(Continued Next Week.)

A woodlot is just as deserving of care and good treatment as is the garden, orchard or the pet horse.

A Story for Children

"How the Bunnies Were Saved"

THE Bunny household was in great excitement. Father Bunny had closed up the back door to keep the house warmer. Now, he decided it must be opened and quickly so he set to work.

First, he pulled down the props and then started to dig. The dirt flew in his eyes but he must not stop. The sounds were getting closer and closer and he could hear the hunters shouting to the dogs. Poor Father Bunny grew so tired he could hardly dig, but then, he thought of his poor frightened wife and children and he worked faster and faster. At last, a light appeared and then it was easy except that he must be very careful not to make a noise.

Finally the door was opened again and now he must get his family ready for a quick flight. So he spoke very harshly, something he never had done before, but he knew their lives were in great danger and there was no time to be lost.

"Hurry!" he said, "run out that door as quickly and quietly as you can after me. Follow me and don't look back! Ready, now, here I go!"

So saying, Father Bunny dashed out the door and across the ground. Mother Bunny and the two small Bunnies followed. On they went, over fallen trees and thru bushes until at last, Father Bunny led them into an old hollow tree. There they lay panting for breath. They did not go back to their old home but built a new one the next day where the hunters could not find them.—L. M. K.

THE BABY'S PILLOW

"So tired, mamma!" our darling one whispered when the day was done, "And climbed upon my knee. 'This is the nicest place to rest—' His curly head upon my breast— He placed so trustfully. We thoughtless mothers little know How far each day the children go.

If we could measure all the miles They travel, with their tears and smiles. We should not chafe and fret Because they leave their books and play.

And come to us at close of day, Their cheeks with tear-drops wet; Or think it such a grievous wrong They ask for story or for song.

"So tired, mamma! A story tell To baby; one he likes so well. About the 'Blessing Man' Who had that gentle, loving look, And in His arms the children took; Please, mamma, if you can." And so I told the story o'er As I had told it oft before.

But at the close that night I said, "Christ had not where to lay His head

When He was tired, my child. 'Foxes have holes, the birds have nests,' And children have their mother's breasts."

The baby's blue eyes mild Looked into mine, and then they strayed Where his own wee soft bed was made.

"I wish that I'd been there that time,"

He gently said, "I'd given mine— My little pillow white— I'd let Him have it, too, to keep, So he could have a place to sleep

As I do every night. 'Mamma, do tell Him that I would Give Him my pillow if I could."

Not Impressed

"Here's a very fine landscape, sir," said the art dealer. "It's only \$10,000."

"Why, there's nothing in that picture but a couple of cows and a pasture," said the war millionaire.

"True, but it's a work of art."

"Umph! I could buy the land and the cattle for \$10,000."—Birmingham Age-Herald.

True Value DAIRY FEED

It's No Fun to Get Up Early in Winter

It's no fun to get up early in winter—milk a whole string of cows and find they are producing only a small amount of milk. It kind of takes the "pep" out of a fellow—especially when prices for milk are none too high.

There's always a reason for low milk production—You may have the best producers—housed in a warm, well-ventilated barn—with every known convenience at hand, but, if your cows are not being fed a *truly* productive ration, they will not produce as *much* milk as they are capable of producing.

True Value Dairy Feed
The Name Describes It

Record Maker Dairy Feed
The Feed With a Sweet Taste

True Value Dairy Feed and Record Maker Dairy Feed are truly *productive* rations—They supply just what a cow requires for maintaining her bodily vigor, and producing the maximum amount of milk.

Our chemists know the exact nutritive value of every grain. They know just what a cow needs and what she can digest and assimilate *profitably*. Every ingredient in True Value and Record Maker Dairy Feed is supplied for a certain definite purpose—to build new tissue—replace worn-out parts—to produce milk. There is no waste to our feeds because we do not use fillers.

The immensity of our mills makes it possible for us to purchase the best grains at the lowest price. Hence our feeds are always priced the *lowest* of *quality* Feeds.

A trial will convince you that True Value or Record Maker Dairy Feed is the most profitable feed for you to use.

If your dealer cannot supply you write to us direct.

75 Cents per Year

A Plea for Higher Yields Per Acre

Experiments Show That High Yields Are Better for the Farm and the Farmer

By Dr. J. G. LIPMAN
Dean New Jersey Experiment Station

fertilizer returned handsome dividends to the farmers.

THE department of soils of the Ohio State University is publishing a monthly leaflet under the title "Timely Soil Topics." In the September issue of these leaflets Professor J. I. Falconer makes a strong plea for higher crop yields per acre on the ground that higher yields are not only more profitable, but that they also provide for the more effective maintenance of soil fertility. In order to prove his case he makes use of the results obtained in the soil fertility experiments conducted by the Ohio Experiment Station at Wooster.

A four-year rotation consisting of corn, oats, wheat and clover is employed in this experiment. The corn receives an application of 10 tons of manure reinforced with 40 pounds of acid phosphate per ton. The manure is spread on the clover sod in the fall and plowed under in the spring. The only other crop in the rotation which received a direct application of plantfood is the wheat. The application for this crop is 400 pounds of a complete fertilizer per acre. Aside from the manure and fertilizer already mentioned, ground limestone, at the rate of two tons per acre, is spread on the plowed ground before the planting of the corn. As a result of this treatment the four 10-acre fields included in the experiment have averaged, in 15 years, 75 bushels of shelled corn, 62 bushels of oats, 35 bushels of wheat and 3 tons of hay per acre. This compares very favorably with the average yields for the entire state of Ohio for the period 1910-1919. The yields were: 38.5 bushels of corn; 17.1 bushels of wheat; 36.4 bushels of oats and 1.43 tons of hay per acre. The question now arises whether the higher yields at Wooster really gave a greater net profit per acre than did the lower yields obtained with a smaller expenditure of labor and plantfood on the average farm in Ohio. To answer this question the writer cites farm management studies in which approximately the same number of farms whose crop yields were designated as poor, fair and good were compared. The comparison shows that in the first group the value of crops per day of labor was \$11.92. In the second group it was \$15.01. In the third group it was \$18.01. Evidently, therefore, the higher yields paid much better than the lower yields for the labor invested in the crop. Other

From the cost standpoint the higher yields are relatively cheaper, since a number of items which enter into the production costs are not affected by the yields. Thus in the case of corn 65 per cent of the costs would be the same for a 60- and 40-bushel yield per acre. In the case of wheat, 70 per cent of the total costs would be the same for a 24- and 16-bushel yield per acre. As the author puts it: "The farmer who studies carefully his crop yields in relation to his farm business, and who balances the increased costs of securing larger yields against the increased returns, usually will find that the larger yields will give the greater net return for the labor and capital invested."

To what extent the individual farmer will find it to his advantage to reduce his crop acreage in order that he might farm a part of it more intensively will depend on local as well as general conditions. The more important factors that must be reckoned with in this connection are the cost of land, labor and fertilizer on the one hand, and the market value of the crops on the other. However, after all is said and done, the tendency in the United States is toward more thorough tillage and the more generous use of fertilizers. The effect of this condition is apparent in the very slow, but nevertheless, quite distinct increase in the average crop yields per acre. As time goes on this tendency will become more pronounced here as it has become in the industrial countries of Europe. Newer and more economical methods for manufacturing soluble phosphates; the increasing supply of by-product ammonia from our coke ovens; the increasing production of air nitrates, and the more intelligent use of potash and lime will of necessity stimulate a more liberal feeding of crops. This will be still further favored by the use of more concentrated fertilizers whose handling and transportation should be relatively cheaper. All told, then, the rapid growth of the non-agricultural population of this and of other lands, the improved means of communication and transportation, the better appreciation of quality in food products, specialization in cropping, and the further extension in the

"COMRADES"

are also told that 36 farmers in Scioto County raised, in 1919, an average of \$2,855 worth of crops on 65 acres at an average expenditure of \$130 for manure and fertilizer. The most profitable five farms in this group produced \$3,445 worth of crops each at an average manure and fertilizer cost of \$226. It is quite clear, therefore, that the larger investment in manure and

izers whose handling and transportation should be relatively cheaper. All told, then, the rapid growth of the non-agricultural population of this and of other lands, the improved means of communication and transportation, the better appreciation of quality in food products, specialization in cropping, and the further extension in the

ON A LATEST MODEL UNITED STATES CREAM SEPARATOR

SEND
COUPON
TODAY

DIRECT
FROM
FACTORY

At last—a really high-grade standard Cream Separator of national reputation is to be sold direct from the factory at **factory price**.

It's revolutionary; but it's what many of you have asked for. Now you can obtain one if you act quickly.

For 50 years we have been building dairy machinery and Cream Separators. We know from experience that the dairyman is a keen judge of merit. He needs only to be shown.

During the war, with our factory largely turned to war work, our inventors found time to make the few possible improvements necessary to place the United States Cream Separator definitely ahead of all others. This is what we are **ready to demonstrate to you**. Because we are building for the future we make this great money-saving demonstration offer.

Now comes **your** chance. Until April 1st, a few live dairymen in every community will get the benefit of this great price-saving offer—with our money-back-if-you-want-it guarantee. Our benefit will come from the recommendation you give to your neighbors. We ask no more.

During this Big

Demonstration Offer

Until April 1st

the saving is so great no one can afford to overlook this unusual opportunity to secure a United States Separator. **Furthermore we will make you a reasonable allowance for your old Separator** if you have one.

We must be the judge of the number of Separators, at the Demonstration Prices, we can distribute in each community, and those who apply first will be considered first. Needless to say, this offer requires quick action.

Fill out the coupon and mail today to the home office. The Separators we distribute will be shipped from our warehouse at Toledo or one nearer you. No delay.

The World's Best—and Why

Every part of the **United States** is made for long life and smooth running. One piece frame; no corners to collect dirt. The easiest running, easiest cleaning and closest skimming bowl made. No fussing with numbered discs; they assemble quickly in any order. All gears enclosed and run in oil bath. Low crank speed (42 to 48 turns). Equipped

with speed indicator bell. Scores of other mechanical refinements that make the **United States** a labor-saver at every turn. Every **United States** is sold under our

UNLIMITED GUARANTEE

YOU are the sole judge; your money back, if you want it, after a fair trial.

Clip and mail the Coupon AT ONCE!

A Plea for Higher Yields Per Acre

(Continued from Page One).

use of labor-saving machinery and devices will all tend to encourage larger yields per acre.

It may not be amiss to consider briefly the ultimate effect that the method of cropping and fertilization described above will have on the fertility of the land. In the four-year rotation in question there is being removed in the 75 bushels of corn 120 pounds of nitrogen, 40 pounds of phosphoric acid and 80 pounds of potash. In the 62 bushels of oats 60 pounds of nitrogen, 22 pounds of phosphoric acid and 50 pounds of potash. In the 35 bushels of wheat 60 pounds of nitrogen, 23 pounds of phosphoric acid and 37 pounds of potash. In the 3 tons of clover hay, 125 pounds of nitrogen, 30 pounds of phosphoric acid and 75 pounds of potash. The total quantity of the three constituents removed in the four crops would correspond to 365 pounds of nitrogen, 115 pounds of phosphoric acid and 235 pounds of potash. However, in the case of the corn, oats and wheat there has been lost from the soil by leaching at least half as much nitrogen as was taken up by the crop; hence the entire loss of nitrogen has been 485 pounds rather than 365 pounds. But the nitrogen contained in the clover was largely taken up from the air, and the roots and stubble of the clover added to the soil approximately 60 pounds of nitrogen. Hence, the four crops of the rotation caused the soil to lose 300 pounds of nitrogen every four years. From this amount there should be subtracted 110 pounds furnished by the 10 tons of manure and 400 pounds of fertilizer. There should also be subtracted from this amount 20 to 25 pounds of nitrogen furnished in each four-year period by rain, snow and dew. At best, however, the method of cropping practiced at Wooster would cause a net loss to the land of approximately 150 pounds of nitrogen in each four-year period. Furthermore, there is every probability that the clover will sooner or later fail to grow satisfactorily and other legumes will have to take its place. Under such conditions, the fixation of air nitrogen may not be as large as that indicated above. For this reason it must be assumed that in the course of time more manure or fertilizer nitrogen will have to be applied, or the rotation modified to allow the addition by means of legumes of larger quantities of nitrogen to the soil. Otherwise, the maintenance of the yields at the present high level will not be possible.

As to the balance of phosphoric acid and potash, it will be observed that of the first of these there are being removed in each four-year period 115 pounds per acre. The offset to this loss is represented by the 140-150 pounds of phosphoric acid supplied by the manure and fertilizer. The net gain is, therefore, approximately 25-40 pounds in each four-year period. Obviously, then, adequate provision is being made for keeping up the needed supply of available phosphoric acid in the soil. In the case of the potash the net loss in each four-year period is at least 125-150 pounds per acre. It may not be felt for a very long time. Nevertheless, even in this case the time will come when corn and clover will call for more generous fertilization with potash if the high yields are to be maintained. From what has been said above it follows that the maintaining of high crop yields is less costly, from the standpoint of fertilization, on the newer soils. Gradually, sometimes almost imperceptibly, the need for larger additions of available plant-food becomes more pronounced. When this need comes it is usually met, for the older soils return larger net profits where the yields are kept at a high level. This is true for practically all conditions where available plantfood, rather than climate or insects and plant diseases, is the limiting factor of production.—J. G. Lipman.

Home-Mixing of Fertilizer

There is an old trite saying that is quite applicable in a discussion on the subject, namely, "It is hard to teach an old dog new tricks." This saying never stood out more boldly than it does when trying to convince farmers to purchase ingredients or raw materials and mix them at home. The average farmer does not feel competent to mix his own goods; and he likes to work along the line of least resistance. Again, many farmers buy ready mixed goods because they can obtain six to eight months' credit, a thing that cannot very well be done when raw materials are purchased.

Slowness in changing is an attribute not hard to develop in view of the fact it has been inherited thru many generations. This can be readily seen when we observe the attitude of farmers in the evolution of agriculture thru the last century. When David Peacock invented and introduced the first cast iron plow, it was ridiculed by many farmers. They claimed that the metal that wore off the plow would poison the soil, and not as good crops could be grown as could be by stirring the surface with the old crooked stick. But that plow had its day and was used for many years until superceded.

For a quarter of a century influences have been brought to bear to induce farmers to mix their own fertilizers and never during all that time was it more advantageous than at the pres-

nitrogen they carry to the growing crop. But why use numerous carriers of nitrogen in any one mixture fertilizer? Two or three at most is all sufficient. For the last couple of years the writer has used nitrate of soda only; because it was the best, also the cheapest. Where a farmer must have a fertilizer, the nitrogen content of which must last thru the growing season, he should have at least one carrier in an organic compound like blood, fish, or high grade tankage. These are named in their order of availability, together with their agricultural value. On truck or market garden crops where an after side-dressing can be applied during the vigorous growing season, nitrate of soda will give best results, and for the least money.

Many fertilizer companies put great stress on a bone base fertilizer. This is misleading because very little fertilizers are compounded today with real animal bone as a base. Dissolved South Carolina rock, or acid phosphate as it is known in the trade, forms the base of most all commercially mixed fertilizers today. Many farmers think they are buying a more valuable goods if it has an animal bone base, when in reality it is no better.

The phosphoric acid in acid phosphate is all available to the plant when applied, while that contained in animal bone, either raw or steamed, must decay before it can give up its plant food content; hence in animal bone it is much slower.

Potash needs no discussion; our main supply is the German potash salts, either sulphate or muriate; muriate is the one mainly used. In view of the fact that many of our soils have become depleted in this valuable plant food element, due to its high cost during the war, the writer thinks it advisable to use from 3 to 6 per cent even at present prices.

We have discussed the various ingredients that go into a fertilizer. Let us consider these special-crop fertilizers upon which so much stress is laid. For example, "Corn Special," "Special Truck Grower," etc. What compound or mixer can build up such a plant food mixture? What would suit on one man's farm and crops, would not suit on an adjoining farm. The thing hinges on the kind of soil and previous cropping; hence, if the commercial mixer makes his product rich enough to be safe on all soils,

many purchasers will be paying for excess plant food. This is a strong point in favor of home mixing. The farmer can build his analysis to suit his individual needs.

Now let us see what a 4-8-6 fertilizer (or better) can be compounded for at home. Nitrate of soda can be bought today for \$60 per ton. This means \$4 per unit of nitrogen (not ammonia). In blood, fish or tankage, it will cost \$4 per unit of ammonia. Acid phosphate, 16 per cent can be purchased, freight paid to most stations for \$24 per ton reduced to unit basis is \$1.50. Potash is \$2.20 per unit. These prices are for car-load lots.

If nitrogen and ammonia carriers cost us \$4 per unit and we have four units in this fertilizer, we multiply the cost, \$4, by the number of units (4) and we have \$16. Next, we have 8 units of phosphoric acid in the formula. A unit of this costs \$1.50. Multiply this by 8 and we have \$12. Last, we have 6 per cent of potash, which at \$2.20 per unit, will cost \$13.20; total cost \$41.20. In order to obtain this in proper amounts at the same time deriving our ammonia and nitrogen from two sources, nitrate of soda and blood analyzing 12 per cent of ammonia, half our percentage from each we want 266 pounds of nitrate of soda, analyzing 15 per cent nitrogen; this gives us 40 pounds nitrogen or nearly 54 pounds of ammonia; 333 pounds of 12 per cent blood or 400 pounds of 10 per cent ground fish will give us 40 lbs. more of ammonia; now we have 80 lbs.

(Continued on Page 17).

Member Standard Farm Paper Ass'n and Audit Bureau of Circulations

PHILADELPHIA, PA., JANUARY 22, 1921

VOLUME 49 NUMBER 4

OUR JOB is to serve our readers. Whenever you are puzzled, write to us and we will help you if we can.
—The Editors.

The dogmas of the past are inadequate to the stormy present; the occasion is piled high with difficulty and we must rise to the occasion—Lincoln

The Contest Articles

A GOODLY number of articles have come in in response to our request for papers giving the personal experience of readers with tractors and milking-machines, and in improving farm homes. Pressure of work has prevented a prompt critical examination of all these papers, but we have seen enough to know that in the main they are valuable and they will be edited and most of them used as soon and as fast as time and space permit. This is the kind of information our readers like and which we are always glad to receive and publish.

Crop Insurance

IT HAS been said that farming is the biggest gambling game of anything in which men engage. Of course, the farmer has nothing of the spirit of the real gambler about him but there are so many elements of uncertainty in the business that the end cannot be seen from the beginning—hence the saying. One of the most frequent statements made by farmers during the past year is, "I did not get the cost of production." Farming can be conducted longer without a money profit than can any other business, but even farmers would be forced to the wall very soon if they fail to get enough returns to pay the cost of production. For the same reason that they take out fire insurance, to re-emburse them in case of loss by fire, farmers are beginning to investigate the idea of crop insurance so as to be assured of getting back the cost of production in case of crop failure from any cause. Some sections have been insuring against specific damage such as hail, frost, flood, etc., but general crop insurance against failure from any and all causes has just begun. We should be glad to have letters from any of our readers who have had experience in this line of insurance telling us how it worked out.

Learn to Advertise

WE HAVE frequently mentioned the fact that farmers have yet to learn to practice one of the arts of business and that is the advertising of their products. We are not saying this in the interest of Pennsylvania Farmer, for we realize that the class which farmers would wish to reach is city consumers and they are not readers of this paper. The sale and use of almost any food product may be increased by judiciously

Pennsylvania Farmer

and persistently presenting the arguments for them thru the printed page. While it is possible that the total sum of food might not be materially increased, yet certain foods may be and have been. In the case of milk, fruit and vegetables the increased consumption of them would be beneficial to the human race even at the expense of some other classes of food. But first the public must be educated as to their value and economy. On the question of advertising milk, Milk News publishes a pointed article from which the following is quoted:

"Dairymen have failed to successfully sell their own products; moreover, they have been extremely slow to recognize their relations between dairy products and publicity advertising and a fair and equitable price for themselves. Very little use has been made by dairymen of the tremendous selling power of advertising which is so freely employed in all other lines of the industry.

"The trouble with the dairyman has been that he has devoted too much of his time to price controversies, which, after all, have had but a small influence in bringing about higher prices."

Profitable Production

A GOOD BIT of the twaddle about the "encouragement of agriculture" is inspired by the same kind of spirit that animated the monkey while he encouraged the cat to pull the chestnuts out of the fire for him. The cat got nothing for herself and quit. A fair and just recompense for honest effort is the kind of encouragement that never fails to bring results from any class of producers, but farmers are often compelled to toil on without the stimulus of this kind of encouragement. If the consumers of the world wish to make sure of a continual supply of something to eat, let them join with farmers in plans that will assure "a fair and just recompense" to producers of food and an abundant supply at fair prices will always be forthcoming.

The watchword for farmers which Pennsylvania Farmer suggests is Profitable Production first, and Increased Production is needed. We have little sympathy with any interest which continually cries for increased production regardless of the economic phase of the question. On the other hand, we believe in the adoption of methods and practices which will increase the returns per acre and per day's labor. This does not mean an increase in the total production, necessarily, because the farming of fewer acres with increased yields will return the greater profits up to a certain point. We would suggest the careful reading of the first page article by Dr. Lipman this week. We believe no one will deny that the chances of profit are greater for the farmer who uses such methods as will produce 1,000 bushels of potatoes on five acres, rather than poorer methods which will necessitate the cultivation of ten acres to obtain 1,000 bushels. It is this kind of better agriculture that we urge. This principle will not necessarily increase the total production, but it will increase the profits of farming.

A Sensible Veto

FARMERS and sensible people of all classes will applaud the action of President-elect Harding in requesting that no expensive preparations be made for his inauguration. It would be most inconsistent in this time of retrenchment for the Government to set an example of extravagance by appropriating public funds for that which would in no wise add to the dignity nor the efficiency of the event. Of course, there will be opposition by those who would profit by it, but we are sure that the rank and file of the people of the United States will approve Mr. Harding's stand. The said rank and file realize the hardships they will have to endure in order to raise the immense taxes made necessary by the calamitous war without adding an unnecessary dollar for things purely wasteful and unnecessary.

For the same reasons we hope the Pennsylvania Legislature will not sympathize with Governor Sproul's reported wish to send the Pennsylvania National Guard to the inauguration as public expense. There is no more reason for parading the military strength of a state at a public function than there is for displaying any other force or institution.

January 22, 1921

Farmers' Position Improving

ALTHOUGH the individual may discern little if any improvement in his own situation the fact is more and more clear that the farmer has already reached the half-way mark in passing thru the dark woods of business depression and is now on his way toward the other side. The path is not entirely straight but there is no question about its general direction.

Thus far the losses resulting from the decline have not been equally distributed. The following table based upon the November, 1920, whole sale prices compiled by the Bureau of Labor statistics shows this fact clearly. The price level of commodities during 1913 is taken as 100. The highest point attained and the November, 1920, figures are given.

		% Decr. since Highest Nov. high't 1913.	Point 1920 point.
Cloths and clothing.....	100	356	234
Farm products.....	100	246	165
Food, etc.....	100	287	195
Lumber and building ..	100	341	274
Metals and products ..	100	195	170
Miscellaneous	100	246	220
Fuel and light	100	284	258
Chemicals and drugs ..	100	222	207
House furnishings	100	371	369
Weighted total	100	272	207

It is shown that the farm products, clothing and food have declined about one-third and much more sharply than other lines. More recent figures are not now available but they would show some improvements in these relationships.

These figures may be construed into reasons for self pity on the part of the farmer but there are ample grounds for taking encouragement from them, since such disparities cannot continue. During the past two months the farmers' buying power has been at maximum disadvantage because of low prices for his own products and high prices for those he must purchase. The chances now taking place are improving his position. Lower prices for other commodities are coming as well as slightly higher prices on the principal farm products. Altho the farmer has gone half way or more thru the woods, most other groups have not yet reached that point and have farther to go before they will reach the open again.

Other lines of endeavor also can show wounds. A compilation of twenty selected industrial and railway issues show a loss of \$2,722,540,000 in the market value of their securities, compared with the high point reached during the war. Ownership of these securities is not confined to rich men but many small investors are included. The dwindling in value of these holdings is somewhat similar to a decrease in the value of the farmer's investment in land and equipment.

The farmers' dollar will gradually increase in value during the coming months, while the dollars of other lines which have not yet declined will gradually shrink from their present bloated state. "The law of compensation is universal."

Our Washington Letter

Hearings of general tariff revision before the House Ways and Means Committee, and on the Fordney Emergency tariff measure before the Senate Finance Committee, are occupying much time, and are bringing many representatives of the various interests to Washington.

The woolgrowers have presented a strong plea for a protective tariff on wool before the Senate Finance committee. F. J. Hagenbarth, president of the National Wool Growers' Association, said he was pleading for the preservation of the industry, which is facing ruin. Many Western stockmen are being sent to the market to liquidate debts.

George D. Briggs, of the National Sheep and Wool Bureau, declared that there is now in the world outside of the United States a vast accumulation of wool produced at about one-third the cost of producing wool in this country; that the wool is ready to be dumped into this country just as soon as the market shows any life, and unless this foreign wool can be held back by a protective tariff the wool industry in this country will be wiped out. Without a tariff the country is going to be without a sheep industry, and in case of war it would have to pay exorbitant prices for foreign wool.

While the bill does not include the manufactured products of wool in its schedules, John P.

January 22, 1921

Wood, representing woolen manufacturers, favored the Fordney bill as an emergency measure to save the sheep industry, with the confident expectation that the permanent tariff bill will soon give equal protection to the woolen manufacturers.

The proposition to add dairy products to the emergency tariff bill was presented by W. F. Schilling, of Northfield, Minn., president of the Twin Cities Milk Producers' Association, and A. M. Loomis, secretary of the National Dairy Union. Senator Hackney, of Minnesota, W. A. Wentworth of Iowa, and other representatives of the dairy interests have presented strong arguments in favor of a tariff on butter and cheese. Senator LaFollette of Wisconsin has agreed that he will use his best efforts to see that amendments covering these products are added to the bill before it leaves the Senate.

The sugar growers of Louisiana, in asking for more protection on sugar, testified that their industry was in just as bad a condition as that of the grain and livestock farmers. They demand a tariff which will make sugar cost the consumer eleven cents a pound.

In a discussion precipitated by the testimony of a New York City produce importer in opposition to a tariff on Bermuda potatoes, the state was made that potatoes were being shipped from Denmark to Philadelphia at a lower rate than from Allentown, Pa., a few miles away, to the Pennsylvania metropolis. The rate from Denmark to Philadelphia was given at ten cents a bushel, while the Allentown rate to Philadelphia is seventeen cents a bushel. It was also stated that potatoes were being shipped from Denmark to New York at a lower cost than from Maine to the same market.

An amendment adding canned salmon, herring and cherries to the bill, has been submitted by Senator Jones of Washington. The committee is besieged by men who want to be heard in favor of amendment or against duties on commodities in which they are interested. All this means delay for the bill, and jeopardizes its chances for success. Senator Smoot declares that "to amend this bill means that it is gone. It won't pass if it is changed." Senator Boies Penrose, chairman of the Finance Committee, has reversed his former position in regard to the emergency tariff, saying that he is in favor of the Fordney bill with a few changes. He believes the rates should be modified in some schedules. The New York bankers, it is said, fear that the legislation will result in retaliatory measures by foreign countries, which will seriously injure our American industries, and are bringing some pressure to bear against its enactment.

Commenting on the Capper-Horsman collective bargaining bill, Senator Arthur Capper of Kansas, says the friends of the measure are going before the House and Senate conferees, when they meet. The farm organization representatives will declare that they regard the Senate amendments as objectionable, and there are fair prospects that these nullifying amendments will be stricken from the bill. Senator Capper considers the bill as it passed the Senate better than no legislation. Its greatest value is the fact that it recognizes the farmers' co-operative movement. In the course of five years, he predicts, a vast development along co-operative lines will take place, as this is the only practical suggestion toward eliminating the great spread between producers' and consumers' prices. Ours is the most inefficient system of marketing in the world, and we have got to work out a practical programme that will solve the marketing problem.

In regard to the five or six bills designed to wipe out gambling in futures, Senator Capper says he does not see any conflict between his bill and the others. It is not his desire to wipe out the boards of trade. Hedging may be desirable on the part of men actually dealing in grain, but speculative and gambling in products that do not exist should be stopped. The Senator does not expect to set up something better that will take the place of the grain exchanges, he doubts if it would be wise to eliminate boards of trade. All these anti-gambling bills are being opposed by Chicago bankers.

The Federal Trade Commission has made a report to Congress, dealing with country elevators and grain marketing. The report is based upon returns of about 10,000 country elevators throughout the nation. According to this report, "commercial elevators are most important in Nebraska and the fourth Northwestern states, and independent elevators in Iowa, Kansas and the states east of the Mississippi."

Dr. T. C. Atkeson, Washington representative of the National Grange, says it is his conviction that the committee will report the bill favorably to the Senate. If it passes the Senate it will be in a different form from the House bill, which will delay it in conference. If it should go to the White House, it is believed that President Wilson will veto it, and that its friends in the Senate will not have enough votes to pass it over the President's veto. Dr. Atkeson is unqualifiedly in favor of the bill. Even if it is rejected on the tariff and the sentiment so strongly presented at the hearings in favor of the same protection for farm products that other commodities receive may be reflected in the general tariff bill which will come before Congress in an early date.—Elmer E. Reynolds.

Pennsylvania Farmer

HARRISBURG LETTER

Down to Business.—Pennsylvania's Legislature is down to business after much backing and filling and the resumption of sessions after a fortnight's intermission to permit the committees to be made up and the jobs to be apportioned in the time-honored style finds many of the members desirous of getting thru with a minimum of rows and loss of time. It might be added they are not inclined to be "meanly-mouthed," to use an expression much employed around here, in saying so. One of the things which must have impressed the legislative leaders in the convening days was the general demand that the program be worked up and worked out. For this it is more than suspected there is the hearty support of one Boies Penrose. Hence prospects are bright for a well handled session, if not the adoption of some method of getting expenditure of state money or clerical time that system city folks are so fond of lecturing the farmer about. There have been intimations at the advance of the last three sessions that the cost unit system was to be applied to hospitals where it would be found to operate as well as on the farm, but the coming of spring has put such promises among the moth balls. Governor William C. Sproul will enunciate his ideas on legislation in the first formally delivered address and then the legislative mood rates will be opened and bills will pour into the houses. Whether the admonitions of the presiding officers to enact as few laws as possible will be heeded is uncertain. In any event, the Legislature is down to business with a prospect unusually good for a beneficial session. If the men at the helm of Republican affairs wish to avoid explanations they have an easy way to do it.

Women to Take a Part.—It is evident the new women's organizations are going to make themselves felt during the session and it will have a wholesale effect. Legislators will not be likely to antagonize women by joining in raids on Sabbath or liquor laws, tinkering with the labor laws or similar matters. Where the ladies and the legislators may differ will be over the amount to be voted for mothers' pensions and the educational program. The Governor is inclined to favor various plans to increase the state's revenues and may have the support of a considerable element among the women, but Governor and legislators alike are apt to find women more or less inclined to want more information about the charities that has been commonly available.

Want to Go to a Vote.—The policy of the Sproul administration will be to have the question of a constitutional convention go to a vote of the people. This position has become stronger than ever as the result of events of the week just closed and the speeches made in Philadelphia will probably be supported by a strong declaration from the Governor. Coupled with the move for speedy submission of the question is a hope that the convention might meet next year.

Strong Weed Bill.—While Secretary of Agriculture Fred Rasmussen was presenting his preparing much legislation the last week because of a severe cold he has outlined his scheme for a new weed bill, which it is hoped will aid materially in his plans for ridding the state of noxious growths which lack of labor have made a nuisance. The secretary has had strong support from many people in his move for a good weed law. His plans for extension of state supervision and the building up of the services which he has developed are to be worked out, having received the approval of the Governor.

More Cars on the Farm.—If what State Highway officials say is true the number of automobiles and farm wagons mechanically driven to be registered for use on farms in 1920 broke all records for increase. Heavy purchases of cars for rural delivery are reported to have been made during the fall and the January 1 registration of cars has shown a surprisingly large number of automobiles on the farm. And by the same token the decrease in horses is rather more than looked for. Efforts to get complete data on farm owned cars and wagons and on live stock are under way by the statistical bureau of the Department of Agriculture.—Hamilton, Harrisburg

NEW YORK LETTER

Exporting Choice Seed.—The fame of New York state's certified seed potatoes has extended until Danish growers are purchasing seed of Cortland County growers, thru their Danish co-operative association. The seed will be used to determine its adaptability to Danish soil, climate and diseases.

Decrease in Farms.—Cortland County is one of the smaller counties, but of rather more than average prosperity. Yet, in the last 20 years there has been a decrease of 439 farms in the county. In 1900 there were 2751 farms. In 1910, 2616 farms and in 1920 but 2315 farms.

Violations of Storage Laws.—In 1920, retail dealers paid \$1182 in fines for selling cold storage eggs under false pretenses. A total of 3283 pounds of meat in cold storage was destroyed by inspectors as unfit for food and \$3594 was paid in fines for holding food over 12 months.

New York Has Fifth Place.—New York state

ranks fifth in agricultural production, according to Federal figures. In 1909 it ranked eighth; from 1914 to 1918 it ranked twelfth, in 1919 it ranked fourteenth. New York state apples, potatoes and tame hay production ranked first this year and nearly if not quite first in dairy products. Despite greatly increased yields the state's crops sold for \$2,000,000 less than in 1919, or 41.4 per cent lower than a year ago, and 3.6 per cent lower than the average the past ten years.

Action Against Milk Dealers.—For the first time in many years the State Department of Agriculture is prosecuting milk dealers who persist in violating the law by using bottles other than their own.

New Commissioner of Education.—Dr. Frank B. Gilbert, former deputy commissioner of education has been appointed commissioner to succeed Dr. Finley. Dr. Gilbert and his department are engaged in a new budget that shall conform to the new Governor's recommendations for economy. One line where saving will be made is in the imparting of physical training in elementary schools, the teachers to be required to fit themselves to give their pupils this work. Another cut will be made in Americanization work.

Big Holstein Sales.—The first sale of purebred Holsteins, under the management of the State Holstein Association, opens in Rochester this week with 140 of the state's highest class animals offered. Last week at the ninth sale of the Liverpool association 233 purebred Holsteins sold for \$69,050, or an average price of \$296 per head. The state's two champion butter and milk cows were sold, among other fine animals. The majority of the buyers were from other states. The purebred industry is looking up with promise of better conditions in dairying.

NEW JERSEY NEWS

Convention a Credit.—It is not far-fetched by any means for one who is not engaged in agricultural pursuits to say, that the 1921 convention of the farmers of the state and kindred workers held in this city was a credit to everybody participating. Representative in every detail, the gathering attracted unusual attention and admiration from thousands of persons interested in agriculture. Men and women of high standing in communities thruout New Jersey viewed at the Second Regiment Armory splendid displays of produce and stock, while in the Assembly Chamber at the Capitol, informative addresses were delivered to willing listeners on subjects of much importance to the success of the state from a farmer's viewpoint. The management of the convention was excellent. The members of the State Department of Agriculture, the officials and attaches of the State Department of Agriculture were among those present.

Resolutions adopted were: Whereas, experience with the operation of the daylight saving law has proven it to be confusing and definitely harmful to the agricultural industry without apparently adding to the efficiency of its beneficiaries, be it resolved, that we reaffirm our previous opposition to this scheme on either a municipal, state or national basis, and urge our representatives at Trenton and Washington to oppose it at all times;

"Whereas: Trespassing by hunters on private property is common during the hunting season with damage to livestock and various violations of property rights; be it resolved, that the New Jersey State Agricultural Convention favor legislation requiring the obtaining of written permission from the owner or lessee of the property to be hunted over, and request the State Fish and Game Commission to include this requirement on all hunting and fishing licenses;

"Where, the increasing use of the automobile by the criminal element renders unprotected rural districts more liable to attack, as well as rendering pursuit and capture more difficult, be it resolved, that we favor the establishment of a State constabulary that will give greater protection to the rural districts;

"Whereas, the farmers of the State of New Jersey are suffering serious financial loss from the ravages of wild animals protected by the game laws of the state, therefore, be it resolved, that the State Board of Agriculture in convention assembled recommend that in the appointment of a Fish and Game Commission, the farmers of the state be given a representation of at least fifty per cent.

"Be it resolved, that the State Agricultural convention approve the action of Commissioner of Motor Vehicles William L. Dill, in revoking the driver's license of any and all automobile drivers detected in using automobiles or any other motor vehicles to aid in stealing farm produce from the farms of the State."

Governor Edwards expressed the hope that before the expiration of his term as Chief Executive of the state, as many good roads as possible should be built in front of the farm properties in New Jersey in order that the best of facilities could be provided for the rapid transportation of farm produce from the growing points in the state to the centers of population. He asserted that he had named Charles Seabrook, of the Seabrook Farms in South Jersey, to the State Highway Board for this reason.—Kelly, Trenton.

CALORIC means-HEAT

CALORIC is the name of the heating plant that heats buildings like the sun heats the earth—by natural circulation of air.

To your family the Caloric Pipeless Furnace offers; June-like warmth in every room (70° guaranteed in coldest weather)—fuel bills cut $\frac{1}{3}$ to $\frac{1}{2}$ —clean rooms—drudgery banished.

The Caloric has no pipes and heats old or new homes of 18 rooms or less, through one register.

Usually installed in one day. No alterations, no plumbing, no pipes to freeze. Made and guaranteed by the largest manufacturer of warm-air furnaces in the world.

The Caloric guarantee—your satisfaction or money back. See nearest dealer or write today for book giving details.

The Dairy Feed Market

A Discussion of Present Prices and Future Outlook of the Market

By SANDERS SOSLAND

LATE winter often witnesses a bull market for feedstuffs. Of course, there have been exceptions in recent years. In view of the abnormal influences surrounding the trade, which are more perplexing today because they have not been felt in previous winters, consumers and operators on markets are wondering whether advances will occur this year. Probably the most favorable factor so far as the usual winter bull price trend is concerned is the already low level of feeds and the sharp recessions witnessed during the fall and early winter. A reaction is a natural development, and this could be hastened by the normal enlargement in winter feeding operations. However, it is questionable whether these influences can offset the bearish tone created by the depression in live stock, the strained credit situation, the enormous supplies of various feeds in the country and the fact that deflation has not yet been terminated.

Among the feedstuffs in which Pennsylvania consumers and those of surrounding Eastern states are vitally interested and which give promise of enjoying a winter upturn in prices, cottonseed cake and meal probably are in the first rank. Few feeds have undergone as radical readjustment as the by-product of cottonseed and, having reached a level which is low compared even with the pre-war average price, it is not reasonable to anticipate any further material recessions in the market. Instead, cottonseed cake and meal are, according to close students of the trade situation, around their bottom, with moderate rallies in prices to be expected from time to time. However, it is as unound to look forward to sharp advances in the high protein feed as to anticipate still further sharp declines. Cake and meal are not in a position where radical upturns can be easily recorded, yet the consumer who has the funds and other facilities available will doubtless profit by accumulating requirements a few months ahead, possibly as late as the opening of the summer season.

Operations of cottonseed crushing plants in the South have been sharply curtailed, many of the larger mills having shut down temporarily at least. One of the important influences in the curtailed activity of crushers is the large accumulation of cottonseed oil, both crude and refined, and the inability of producers to work off their burdensome stocks because of the extremely light demand. The keen disappointment over prices being offered for seed has caused a sharp letup in the sales of the product by planters over the South, and comparatively little is now moving to mills, this also restricting operations of crushers. However, there are still large quantities of seed in hands of the planters, and while it is true that considerable will be fed and used as fertilizer, the bulk of the farm holdings must yet move to crushing plants. As the demand for cottonseed oil and cake and meal improves, crushers will increase their production, which will thus tend to check a rising market for the protein feed.

As to the demand prospects, the market is in a firmer position. Feeders have bought on a slightly more liberal scale and the retail feed distributor in the interior who has been a very small buyer thus far on the crop is now taking hold more freely, accumulating stocks for the remainder of the winter in a great many instances. This is rather significant, indicating that the retail dealer, who is in close touch with his trade, anticipates an enlarged demand from consumers. Manufacturers of mixed feeds and commercial fertilizer continue very small buyers, and foreigners display an almost total lack of interest in the market. While there is no immediate prospect that these interests will soon take hold more freely, their entrance into the market might easily start values upward. Cottonseed cake and meal of 43 per cent protein content is selling around \$26 to \$27.50 a ton in Little Rock, \$23 to \$24 at Texas points, \$26 to \$27 in Oklahoma and on a freight differential at Memphis and other southern points.

While the two high protein feeds are rather closely related, the influences surrounding linseed cake and meal do not make for as firm or strong a market as in cottonseed feed. The stocks of linseed feed in crushers' hands are burdensome, new buying is of an extremely light volume and jobbers and other handlers are providing crushers with shipping directions very slowly. The same condition prevails as to the demand for linseed oil as for cottonseed oil, the stocks being large and buying almost stagnant. But there is a large amount of flaxseed available, coming largely from Argentina, and so long as these imports continue on a liberal scale, it is improbable that any material upturns or even firm prices will be witnessed. Of course, to those who recall that at this time a year ago linseed cake and meal were bringing around \$82 a ton, basis Minneapolis, or more than double the present price, the current market may offer some bullish prospects. Still, the current level is considerably above the pre-war basis and far above a parity with cottonseed feed and oil products. Linseed feed should decline further.

A perplexing condition exists in the bran and shorts market. Bran has sold at an actual premium over brown and gray shorts, one of the few times in the history of the milling industry of the United States that such a disparity was noted. Hardly four months ago gray shorts were enjoying a very keen demand at a premium of \$20 a ton over bran, while it is true that considerable the entire value of the offal today.

Have you ever
used

Mechling's SCALE OIL?

There are many conditions
under which it is the
ONE BEST

Dormant Spray

and under all conditions
it is the least disagreeable
spray to use.

The normal differential on shorts over bran is about \$4 a ton. The fact that the present disparity exists means that bran must recede in price. Market observers almost generally manifest a bearish attitude toward the lighter offal, while the feeling is apparent, too, that brown and gray shorts must enjoy a slight upturn. Bran is above a parity with other feeds and can easily undergo a readjustment downward in price, and this is expected to be hastened by the slight improvement in demand for flour and probable enlargement in the production by mills of the country. An over-extended short interest in the bran market, though not of pronounced proportions, has been an influence in sustaining the offal above shorts.

Bran is being quoted around \$27 a ton, basis Minneapolis, \$24.50 to \$25 in Kansas City, \$30 in St. Louis and \$37 to \$38 a ton on the Philadelphia market. For gray shorts, Kansas City quotes around \$24 to \$25 a ton for prompt or thirty-day shipment and about \$23 to \$24 for brown. Minneapolis is offering brown shorts or standard middlings around \$24 to \$25 a ton and flour middlings at \$28, with \$30 asked in St. Louis. The Philadelphia basis will figure around \$34 for brown and \$39 for gray shorts. Bran is about \$2 a ton higher than a month ago, while the shorts market is about \$2 to \$3 a ton lower. As the winter season advances, the spread between bran and shorts will widen in favor of the heavier offal. Around the time that the spring pig crop begins using feed on a large scale, shorts are at the sharpest premium over the lighter mill feed.

Dairymen of Pennsylvania and surrounding states of the East are small buyers of alfalfa hay. The feeders could make use of alfalfa hay to good advantage, but the delivered cost of the legume is too prohibitive to feed on an extensive scale. The Eastern dairymen do not look upon the prices at Western distributing markets as abnormally high, around \$22 to \$25 a ton in Kansas City, but after the exorbitant freight rates are added, the hay is on too abnormal a plane. The delivered cost in the East is around \$45 a ton. At the same time that the Eastern dairymen is complaining of the high cost of alfalfa, the producer in the West is refusing to sell because the price is too low. But this is a buyers' market, and with enormous stocks of alfalfa still in the country, lower prices must be recorded. As the movement of alfalfa from the Northwest increases as a result of the reduction in freight rates from Idaho to Kansas City, values will work down. Other consuming outlets are slow buyers of alfalfa.

Corn, oats and the sorghum grains have undergone moderate declines, but now are in a slightly stronger position than a month ago. Cash corn is bringing around 63 to 74 cents a bushel in Chicago, about 5 to 10 cents lower than last month. Oats are holding between 45 and 48 cents a bushel on most Central States and Middle West markets. Kafir and milo are selling at an abnormally low level, down to 65 cents per hundredweight in the interior of Kansas and other southwestern states and around \$1 in Kansas City, the leading distributing point for the sorghums. There is a prospect of a heavier movement of corn to market, but the almost general dissatisfaction over prices is retarding the marketings.

Hand mixing
us

TI-O-GA FEED SERVICE

Time was when folks ground their own flour, tanned hides and made boots, spun yarn and wove cloth. Mixing grain by hand on the barn floor today is just as unprofitable.

Admitting that the feeder knows all the requirements of a balanced ration—knows where, when and what to buy to supplement feeds already on the farm, hand mixing is inefficient, costly, and hard work.

TI-O-GA Feed Service is under the personal supervision of experts who know what to buy and where to buy; they know what ingredients to use in compounding feeds to maintain scientific standards at lowest cost to the feeder. Modern machinery is used for mixing feeds to form balanced rations which make results certain when fed with the class of roughage as intended.

Red Brand TI-O-GA Dairy Feed

to be fed with low protein succulent roughage: Silage, Pasture, Green Fodder, etc.

White Brand TI-O-GA Dairy Feed

to be fed with medium protein dry roughage: Timothy Hay, Mixed Hay, Corn Fodder, etc.

Blue Brand TI-O-GA Dairy Feed

to be fed with high protein dry roughage: Clover Hay, Alfalfa, etc.

In each case the cow gets the same amount of nutrition in the same nutritive ratio and you get more money from your roughage.

If your dealer does not have the kind of TI-O-GA Dairy Feed to balance your roughage, advise us and we will arrange for some nearby dealer to supply you.

Our book on TI-O-GA Feed Service and explanation of how the three feeds give the same results, sent free on request.

Tioga Mill & Elevator Co.
Waverly, N. Y.

The same careful service is furnished through:
TI-O-GA Brood Sow and Pig Feed.
TI-O-GA Growing Shout Feed.
TI-O-GA Fattening Hog Feed.
TI-O-GA Chick Feed.
TI-O-GA Growing Mash.
TI-O-GA Growing Grains.
TI-O-GA Laying Food.
TI-O-GA Poultry Grains.
TI-O-GA Calf Food.
TI-O-GA Horse Feed.
Colonel's Ration (Full Feed for Horses).

Use the TI-O-GA Dairy Feed which forms a balanced ration with your own roughage.

Bankers and Fertilizers

Bankers are keen judges of what is "good" and what is "bad" in the business of farming. The Federal Land Banks, and bankers in general, consider good fertilizers a sound investment always. The world must have food—a new supply must be grown annually—over-production and low prices one year usually mean smaller production and higher prices the next.

They are quick to recognize the progressiveness of the farmer who, too, reasons it out that way and orders his fertilizers with an eye to the future. It strengthens his credit. It is good business—for him and for them.

And that is the sort of farmer who insists on good fertilizers. A A C Fertilizers are good fertilizers. They are a farm asset that never fails to make farming a better business—each crop a better crop—than it would be without them.

When you use A A C Fertilizers you put into your agricultural efforts the results of over half a century of crop and soil study, of thousands of field tests—fertilizers made right from the best ingredients the four corners of the earth can provide.

HORTICULTURE

The Season's Lessons to the Fruit Growers
By Dr. J. P. STEWART

AN APPLE BUYER of the writer's crop of fruit. The amount of marketable fruit, of 2½ inches or larger, was nearly twice as great at the close of the season on the thinned trees as on the unthinned. This effect was lessened or lost altogether, however, when the trees were bearing only a light crop, before the thinning was done. This effect was observable even when the thinning was done after the June drop had been completed. In general, considerable benefit may be derived from proper thinning of heavily loaded trees, but the present evidence seems to confine this benefit to an improvement in the average size of the fruit.

The growers should also take an inventory of their recent experiences, with a view to make improvements and avoid repetitions of their mistakes, so far as possible to do so.

One of the most evident improvements needed in this connection is to get a better grade of fruit from their trees. Already some of the more wide-awake groups of growers are getting together to discuss the best means of doing this and are also getting outside talent to assist in the discussion. Their interest also seems to be running in the direction of the possibilities of thinning and of fertilization rather more than usual. The present special preference among buyers and consumers for the largest apple possible has probably had considerable influence in bringing this new interest to the front, and the writer's views have been sought as to the probable values of the two influences named, in securing the effect desired.

Improving the Grade

In the first place, we wish to state that the most important means of improving the grade of fruit harvested is by means of the spray pump. If the fruit is not properly sprayed, there is no chance of making it really acceptable by any other means.

After the spraying has been properly attended to, it may be desirable to give some attention to thinning and fertilizing. Since there is also a good deal of misapprehension as to just what may be expected from each of the latter influences, it may be well to make a few suggestions based on the most recent or extensive studies.

What Thinning Does

Many people think that thinning apples will not only materially increase the size of the fruit of that year, but that it will also have a strong tendency to increase the size of the crop the following year. In experiments carried on in West Virginia from 1912 to 1919, however, it was rather conclusively shown that "neither the tree as a whole nor the individual fruit spurs are influenced by the removal of part of the crop to such an extent that either the tree or the spurs bloom again the following season." As a result of these and other experiments therefore the authors conclude that "Fruit thinning, then, does not affect the annual bearing of apple trees."

In those experiments, however, thinning did greatly increase the average size of the fruit left on the tree, particularly in those cases in which the trees were bearing a good

What May be Expected from Proper Fertilization

Here again there is a common impression that one of the chief influences of fertilization is to increase the average size of the fruit. This may be the case to a very limited extent, as some of our own experiments have indicated, but the chief influence of the right kind of fertilization is to increase the crop of fruit.

This is accomplished chiefly by nitrate or at any rate by nitrogen fertilization, and this element tends to reduce or retard the color unless applied in relatively small amounts. In general, five pounds per mature tree of nitrate of soda, or its equivalent, are enough to reasonably stimulate the yield, and under most conditions this amount will not greatly retard the color, except possibly in such a long-season variety as the York Imperial. In such a case, early application of the fertilizer and relatively late picking will probably overcome the ill effects on color.

The chief means of increasing the average size of the fruit, however, is by increasing the available supply of moisture. This can be done either by means of proper tillage or by maintaining a sufficient mulch of straw or its equivalent. The latter will have to be attended by some protection against mice unless the trees are at least twenty years old or more.

Importance of Bulk Sales

One of the unexpected developments of the present season has been the unusual success of the bulk sales of apples. The bulk sale is generally looked upon as the least efficient and least profitable method of disposing of apples of any kind. This year, however, it is not at all uncommon to see fruit selling at about \$1.75 or better per hundred in bulk, and to see at least as good a grade of the same kind of apple selling at 75 to 85 cents in baskets, machine-graded, on the same market. On a very similar market at the same time, machine-graded apples, in barrels costing \$1.50 or more, were netting the grower about \$2.80 per barrel f. o. b. shipping point, which, after deducting the cost of the barrel and picking and packing costs, left less than fifteen cents a bushel or less than thirty cents a hundred for the fruit.

I suspect that if everyone could have guessed the future a little better this past fall, the number of apples put into barrels or other pack-

ages would have been very much less than it was. It will be interesting to note the effect of this condition on next year's prices of packages and also on the general handling of the apple crop. What are the experiences of our readers in this connection?

PEACH LEAF CURL EASILY CONTROLLED

Ranking with brown rot, yellows, and little peach, peach leaf curl, despite the ease with which it may be controlled, takes a heavy toll from the pockets of peach growers. Trees weakened by defoliation year after year, loss of crops from the defoliation and from tree weakness, and reduction in size and quality of the fruit remaining upon the tree, are some of the most disastrous effects of this disease.

Leaf curl is evidenced by the abnormal swelling and deformation of new developing leaves on the tips of the shoots, during the early spring. It attacks new growth on all portions of the tree, sometimes causing all of the leaves and much of the fruit to drop. It is worst in wet cool seasons, and near large bodies of water. After defoliation, new growth starts immediately, and the disease again attacks it, but these attacks grow less violent, and by midsummer the tree usually regains a fair set of foliage. The drain on the tree has been so severe, however, that it never fully regains its vigor during the season.

This weakening goes farther than the mere loss of leaves and some fruit. The weakened tree cannot carry a full crop the following year, and frequently the drain is so great that only a small set of fruit buds is secured.

Peach leaf curl is extremely easy to control. Thru spraying with concentrated lime-sulfur, diluted as weak as 1-15, or 4-4-50 Bordeaux, during the dormant season before the buds start to swell, will give entire control. Thoroughness is the important factor. Every bud must be coated. This can be done only by spraying thru the tree to the inside of the twigs. An attack of curl after a dormant spray has been applied is a certain indication that the spraying was carelessly done. Fall spraying, after the leaves have fallen, is as satisfactory as spring spraying.—New Jersey News Letter.

PEACH GROWING INDUSTRY THREATENED

Will history repeat itself in the destruction of the peach growing industry in Pennsylvania?

The Bureau of Plant Industry, Pennsylvania Department of Agriculture is bending all its energies to save the peach orchards of the state from destruction by peach yellows. A special survey of the industry has been undertaken in an effort to save the thousands of farmers and orchardists growing peaches from suffering a heavy loss.

A score of years ago the peach yellows swept over New Jersey, Delaware and Pennsylvania and destroyed practically every peach orchard in these states. It has only been within the past few years that the industry has recovered from this blow.

The only known and sure method of fighting the disease is to destroy the trees when the disease first appears. On account of the nature of the disease it is impossible for the average layman to detect its presence until the advance stages have been reached, by which time the entire orchard has probably become affected.

NEW IDEA and NISCO SPREADERS

- 1 Patented Steel Distributor. No two blades hit manure at the same time. Gives perfect distribution.
- 2 Four point direct-from-axle feed. No jarring motion or strained parts. No cams or eccentric running when driving to field.
- 3 Sprocket chain conveyor running over solid bottom. Improved construction. Saves much fertility.
- 4 Lever at seat regulates loads per acre. Spreads thinly or heavily as you wish.
- 5 Direct chain drive means greater simplicity and durability. No gears to break or freeze.
- 6 Self-aligning bearings on all cylinder and distributor shafts. No expensive replacements.
- 7 No neck weight on horses and no straining of bed. Built like a strong farm wagon with solid axle.
- 8 Working parts protected with removable shields. Keeps manure and straw from catching. Easy to oil.

NEWIDEA

The Original Wide Spreading Spreader

"NEW IDEA" and "NISCO"—two trade-marks representing spreaders that are identical in quality, in principal, in design and in mechanism, except for some minor differences in running gear which adapt them to varying field conditions in different parts of the country.

YORK CHEMICAL WORKS
YORK, PA.

The Profitable Use of GRO-ALL Fertilizers in Winter Time

Every farmer can make money by treating his stable manure with GRO-ALL Fertilizer. The Ohio Experiment Station has shown that 75 to 100 pounds of GRO-ALL Dissolved Phosphate sprinkled over a ton of fresh manure, before it leaves the stables, will increase its value 40% when used on corn, 50% on wheat, and 80% on hay.

GRO-ALL Fertilizers are manufactured from only the best materials. GRO-ALL formulas are based upon the combined knowledge of experienced agricultural chemists and agronomists. Perfectly mixed and cured by modern factory equipment, GRO-ALL Fertilizers are always in excellent mechanical condition. They will feed your crops from seeding time to harvest.

Look for the GRO-ALL Trade Mark on every bag of fertilizer—it stands for Highest Quality at lowest cost.

Fertilizer prices for next season have been sharply reduced. It is to your advantage to order your supply of GRO-ALL for 1921 Spring's work now.

143 Market St. Salisbury, Md.

ALLEN'S PLANTS

THE FERTILIZER SITUATION

By Dr. J. P. Stewart

This is usually about the best time of year to place one's contracts for the season's requirements in fertilizer. This may also be the case right now, especially if one is confining his purchases to the unmixed materials, rather than the commercial mixtures. In the mixtures, as usual, there seems to be a disposition to try to hold the prices up as high as possible on the plea of having contracted for their materials at higher prices than those now obtaining, and without regard to the so-called "replacement principle" which was so important in determining price quotations during the period of rising prices.

It will undoubtedly be of interest to know that official figures on importations show that the supply of potash now in sight is almost up to the quantity that came in in the last year preceding the war, when the price went down to less than eighty cents a unit in carload lots. We may hardly expect to buy it as low as that this year, although even this is possible, but at least no intelligent farmer should be expected to pay the rate for potash that is being asked in the mixed-fertilizer quotations for next spring use, viz.: \$2.50 per unit, plus profits and selling and manufacturing charges.

A similar situation also appears in the case of nitrogen or ammonia, which is likely to be of special importance to the fruit grower. The rates for ammonia in mixed fertiliz-

ers for the spring trade were based on a unit cost of \$5.25 plus the various charges and allowances for profits, whereas the actual average cost of ammonia on Nov. 15, was not over \$4 a unit of 20 pounds, and its cost has also been declining very rapidly since then. Practically every one should be vitally interested in this matter as the cost of fertilizers, in the face of a marked decline in the prices of farm products, may result in a serious reduction in acreage and yield per acre of the crops planted next year.

GUMMED PEACH TREES

A reader in New Jersey writes as follows:

"I have some nice young peach trees which have a tendency to form gum just under the soil on the bottom of the trunk. Sometimes I find little worms in the gum which means exit to the tree, put ashes around and applied hot water. I see some of them are gumming up again."

The gum is only the sign of the real trouble which is borers. Nature makes an effort to cover the wound by exuding the gummy substance. The little white worms sometimes found in the gum do no injury. The writer should hunt out the borers two or three times a year, using a sharp knife and a piece of annealed wire. After he is sure they have all been killed, earth them up in spring five or six inches high. This will prevent the laying of the eggs below the surface. The borers are then easily eradicated. Remove the dirt in the fall.

Peach Growing In South Jersey

MANY years ago Jersey peaches were famous in every large market and were unexcelled for their quality and flavor. Then came a period when from various causes the annual total production diminished rapidly until the state's claim for supremacy was soon rivaled by several other sections and finally was forced to acknowledge competition from such states as Georgia, California and Delaware. But today the tide has turned; the intrinsic worth of soils in many sections, the large markets nearby and last but not least the elimination of certain diseases and insects and the control of others thru scientific methods has resulted in a recovery that promises to place the state and especially South Jersey once again at the head of peach producing sections.

Leading Sections

A survey made by the State Department of Agriculture during the past summer shows the leading peach centers to be the Burlington County district; around Hammonton in Atlantic County; in the vicinity of Vineland in Cumberland County, and the Glassboro district in Gloucester County. Out of a total of 981,434 bearing and non-bearing trees in the State, these four districts have 692,194 trees of which 482,165 are bearing and 210,029 are not as yet producing. The Bridgeton area, with the immense orchards of the Seabrook Farms set since the survey was made, is growing rapidly and will soon compare in number of trees to these four main districts. Of the 692,000 trees now set in these districts over 512,000 trees are of the following six varieties which are placed in order of their popularity as indicated by the number of each: Elberta, Carmen,

Belle of Georgia, Greensboro, Hiley and Champion.

Farm Type

The farms in these districts are mostly specialized fruit farms of which truck crops not interfering with fruit production are also grown and which produce enough general crops for their own use. In some sections, such as the famous river-front district in Burlington County, many of the farms produce nothing but fruit and truck having to buy all the necessary feed for the stock as they believe the acreage ordinarily used for raising feed crops can be more profitably planted to such crops as sugar corn, sweet potatoes, tomatoes and other truck.

As an example of fruit farms of this type, attention is called to the results of a progressive grower in Cumberland County, who, regardless of his success does not seek publicity and when relating the story of the development of his farm requested that his name not be mentioned. This grower moved to Cumberland County in 1912 and located on a small farm of five acres with the idea of raising fruit and poultry. After a short experience with this combination type of farming he found it to be unsatisfactory for his purpose and decided to devote his efforts entirely to fruit growing.

In 1913 he purchased ten acres more and set it out in fruit, immediately following this by buying 3 acres more in 1914 and 35 acres in 1919, most of which has since been set to peaches. At the present time this grower has 2000 bearing peach trees from four to eight years old consisting of the following varieties: Belle of Georgia, J. H. Hale, Carmen, Elberta, Miss Lola, Early Elberta and

Hiley, and in addition 500 trees of the Elberta, Hiley, Slappey and Blackett varieties, which are two years old, and 600 trees of similar varieties set out last spring. Besides the peaches, ten acres are planted to apples, and generally about ten acres to sweet potatoes, and seven or eight acres to peppers, the last two crops often being grown between the young trees until they are of bearing age.

Certain Varieties Popular

On this farm the most popular varieties are the Belle of Georgia, Carmen, Elberta and Hiley. The J. H. Hale peach has not been as successful as was expected in spite of the fact that it produced almost twice as much peaches as the other varieties during the first bearing year. However, since that time it has not borne large crops and the owner is distinctly disappointed and claims he will never set any more of the variety. In justice to this peach it can be said that there are other sections which are strongly in favor of it which seems to indicate that it may be adapted to certain sections. Exclusive of this variety remarkable production has been obtained with an average yield the fourth summer of five to six baskets per tree and during the fifth summer of eight to nine baskets. In 1918, 3500 crates were obtained from 1000 trees and the crop that season brought \$2.25 per crate at the shipping station. The packing on this farm is usually done by an expert packer from one of the southern states who comes north after the packing season there has been completed. A packer of this type averages from 175 to 200 crates daily and has no difficulty handling alone an ordinary day's packing.

"Yellows" and "Little Peach" a Menace

The growing of peaches in these highly developed sections, however, is not accomplished without overcoming many serious problems. In the past years certain diseases such as "yellows," "little peach" and brown rot have been prevalent in these districts and have caused the growers much worry. Due to successful application of scientific principles these diseases have been kept under control in the main, but "yellows" and "little peach" are still a serious menace in all of the important peach sections and the necessity of absolute control to protect the peach industry is recognized by the State Horticultural Society which passed a resolution at its last annual convention recently held, calling for an appropriation of \$5000 by the next Legislature for the purpose of studying these diseases and making a fight against them.

The State Bureau of Markets is constantly emphasizing the necessity of uniform pack for the profitable marketing of peaches. In recent years the best growers have been developing standard grades when packing until today the Bureau of Markets believes that the time is ripe for a marketing law covering the packing of this important fruit. Not only some such system is established on the products of these extensive districts demand their proper value. However, with the planting of over 300,000 trees in the state within the last three years, an active fight against the enemies of this favorite fruit in preparation, and more progressive methods of grading and marketing the Jersey peach will soon come into its own.—L. G. Gilliam, Chief Land Registry, Trenton, N. J.

Protect Your Crop Investment Then Drive Ahead at Full Speed

"THINGS look pretty uncertain this year, John. What with taking chances with the weather, insects and fungus, I don't know where I am going to come out."

"That's one way to look at it Tom. But I am not taking any chances this year. And, believe me, I am not cutting my acreage of cash crops either."

"What are you driving at? You don't control the weather man, do you? What guarantee have you that you'll even get back the perfectly good money you're putting into seed, fertilizer and labor?"

"The best kind of a guarantee, Tom. A legally binding guarantee, signed by one of the strongest companies in America. I mean a Crop Investment Policy in the Home Insurance Company, New York."

John is right, a Home Crop Investment Policy takes the risk out of farming. It guarantees you against the loss of your investment in crop production through insect or fungus damage, drought, excessive moisture, flood, frost and winter kill.

And the cost is less than you may suppose. The rates are based on your crop yields over a series of years. They are just and reasonable.

The Home Insurance Company, New York, established in 1853, has protected farmers from loss through fire, lightning, windstorms and hail. We have paid policy-holders more than \$200,000,000. Our record of fair dealing for nearly 70 years assures you of prompt adjustment.

KEEP PLENTY OF BREEDERS

The practice of penning the breed-

ers and making some selection each

spring in the eggs which are set is,

as everyone who has tried it knows,

one of the surest and cheapest ways

of improving the flock. These breed-

ing birds need not be closely penned,

in fact it is better to give them all

the range available and pen the birds

which are depended upon for mar-

ket eggs. We have followed this

practice for a number of years. The

first time we tried it we hired a man

to come to our place and pick out the

best yearling hens and the best

cock birds and these were mated to

produce hatching eggs. Since that

time we have done our own mating

and there is a marked improvement

not only in the laying habit in our

flock but in the looks of it. A good

many folks do not go much on looks

when it comes to chickens but be-

lieve me it pays if one intends to

sell eggs for hatching.

We made the mistake of using too

few hens the first season, partly be-

cause our yearling females were rather

limited as to number and next be-

cause we did not figure out in ad-

vance how many hens we needed to

produce our required number of

chicks. We just made a rough guess

at it and the results showed that we

guessed wrong. Like a lot of folks

do in counting chicks before they

are hatched we fell into the common

error of expecting too many from a

given number of hens. Since that

time we have figured out a rough

plan of mating breeding birds and

have not since been disappointed.

We base this estimate on and plan

for bringing off our chicks in two

hatches as we find the chicks ma-

ture more evenly and are easily car-

ried for and have the added advantage

of all coming into maturity at prac-

tically the same time. We expect to

have about three hundred pullets for

the laying house each fall so with

this as a basis we started to figure

back to find out how many breeders

we would need to produce this num-

ber of chicks in two hatches. Here

is the way we went about it:

Roughly speaking, half of the

chicks hatched each year will be

cockerels so we multiply 300 by two

which gives us 600 as the required

number of chicks. Next, we figure

that if our hatches average fifty per

cent we are doing very well—we

would like to make them do better

and sometimes they do—also some-

times they don't, so we figure on set-

ting twice as many eggs as we want

chicks. That makes a total of 1200

eggs to be set. Now if each hen

would lay one egg every day the

matter would be quite simple but we

have found that a 50 per cent egg

yield in February and March or in

March and early April, to be about

as good as we can expect on the aver-

age. On this basis counting sixty

days to the hatching season forty

hens would lay the 1200 eggs but

we cannot hold all of the eggs for it

is too long between hatches and the

hatching of the egg is very likely

to be impaired so we again dou-

ble the number and add 20 hens,

bringing the total up to 100 breed-

ers. We add these last 20 to ac-

count for the culs that will be

thrown out in the fall and for brood-

er losses.

Now, figuring on the basis of 100

hens at a 50 per cent egg yield for

60 days we get a total of 3000 eggs.

Half of these will hatch if all are

set. That leaves us 1500 chicks. Half

of these are going to be cockerels

which leaves 750 pullets. Allowing

for selection of hatching eggs and

brooder losses, culling and other

things then this 100 hens will pro-

duce in the neighborhood of 500 ex-

cellent pullets if all the eggs were

set in either February and March or

March and April and the person who

desires that many pullets should fig-

ure on at least 100 breeders and on

setting all of the desirable eggs.

Perhaps you can cut your brooder

loss some, or get a better hatch than

we get, but if you do you are a lit-

tle better than the average if your

success continues over a period of

years.

We have found that we need the

100 hens to get out 300 pullets for

the laying house in the fall, but as

I said we do not aim to hold eggs

very long, so we have a surplus which

are sold to others in the vicinity. If

anything happens, as it sometimes

does, we have something to fall back

on. Personally we would rather do

this than try to sell all of the eggs

laid, thus stretching our period of

chick rearing over a long time and

having an assortment of ages and

sizes in the fall. Besides, the re-

venue from the breeders, when we are

not saving eggs ourselves, is consid-

erable and pays for the extra trou-

ble of selection.—W. C. Smith.

POULTRY QUERY

Editor Pennsylvania Farmer:

We have had invariable good re-

sults from S. C. White Leghorn Pul-

lets, getting as high as 180 eggs per

hen for a flock average, until the

past two years. About April 1, 1918,

we hatched some chicks raising 35

excellent pullets which began laying

September 5th. In November and

December they were all molting and

we got almost no eggs until Febru-

ary. Last year, thinking the others

had been hatched too early, we hatched

some chicks May 1, from which we

raised 150 pullets and these we

separated in three pens of 50 each,

according as to development.

The pen of the best developed pul-

lets started laying last of September,

being hardly five months old, and by

the middle of November were laying

50 per cent or 25 eggs per day, since

then they have gradually dropped off

to about 20 per cent as about half

THE common way of eating popcorn is to pour melted butter over it and sprinkle on salt. But did you never eat freshly popped corn in rich milk, sweetened with a little sugar? It makes a delicious breakfast food or supper dish. Try some.

Always have a brisk fire for popping corn. To be the best, popcorn should begin to pop in 1½ to 2 minutes. Never put more corn in the popper than will just cover the bottom one kernel deep. And when preparing corn for the following recipes remove all unpopped kernels.

Crystalized Popcorn

Boil 1 cup sugar in one-third cup water until it spins a thread or until it reaches 230 degrees by the candy thermometer. Add 1 teaspoon vanilla flavor, and pour over 4 quarts popped corn, stirring it with a fork as you pour, and sprinkling on enough granulated sugar to coat the corn well. Spread out on sheets of waxed paper to dry. You might add a little red fruit coloring to the syrup sometimes to make the corn a delicate pink. And sometimes flavor the syrup with maple flavoring, or else use maple syrup or sugar to make a brown sweetening.

Seafarm Popcorn

Proceed as for the above recipe until the syrup is poured on the corn, then sprinkle with powdered sugar instead of granulated until the kernels separate. Lay out on the waxed paper at once to dry. Different colored syrups may also be used to make this if desired.

Popcorn Crisp

Put 1½ cups sugar, one-third cup corn syrup and one-third cup water into a kettle and stir until it begins to boil. Wash down the side of the kettle with your fingers dipped in cold water or use a wet cloth. Then cover the kettle and steam 3 minutes. Put in the thermometer and cook until the temperature reaches 230 degrees or until it will form a hard ball when a bit is rolled between the fingers in cold water. Now add one-third cup molasses, 2 tablespoons butter and a pinch of salt, and stir constantly until the syrup becomes very brittle when dropped in cold water. Remove at once from the fire and pour it over 4 quarts of popped corn, stirring constantly while pouring to make sure that all the corn is covered with the syrup. Spread the corn out on waxed paper so that it will not pack down, which it would do if left in the pan.

Popcorn Balls

Put 1 cup sugar, ½ cup corn syrup and one-third cup water into a kettle and stir until it begins to boil, then cook to 240 degrees, or until it will spin a heavy thread. Then add 1 teaspoon vanilla, and pour over the corn, stirring well as you pour. Now moisten your hands with cold water, and make the corn into balls of the desired size.

Maple sugar may be used instead of the white sugar. And for variety you can color the white syrup pink, and flavor as desired. Nut meats may also be added to the syrup before pouring. Thus added to the syrup they will be more evenly distributed thru the corn than if they are mixed with the corn before the syrup is poured on, because they will settle to the bottom while you are stirring if there is no "stickum" to hold them to the kernels.

Chocolate Popcorn Balls

Stir 1½ cups sugar, one-third cup

Of Interest to Farm Women and Girls

over the corn, stirring constantly. Spread out on wax paper to harden. —Mary A. Kintigh.

PARTNERSHIP OF ELIZABETH AND JACK

Elizabeth Roberts had for several years uncomplainingly washed, ironed, baked, cooked three meals a day, scrubbed, churned and sewed for her husband, Jack Roberts, and two hired men in summer. And during winter an additional two "hands" were hired much of the time. But did Elizabeth hire two extra pairs of

her request for the money, that he had spent it for some farm supplies. He said it did not matter where the money came from so long as it was for the benefit of the farm.

Elizabeth said nothing, but could hardly keep back the tears of astonished disappointment. But she sensibly began to think a way out. In the first place she reflected that Jack's ideas of a partnership were doubtless the result of family practices in his father's family before him as well as of her lack of assertion since they were married. And she came to the conclusion that it was up to her to see that no such ideas should be inoculated in the minds of their boys who were already showing signs of it. And so she tried to think out how she would show Jack that a husband and wife partnership is quite like a business partnership in that each partner must have similar access to the profits of the firm and that each should confer with the other as to the financial needs of their respective parts of the business.

Several days later Jack was in town again, when a man with whom he had previously talked about selling him some of the fine pigs that were ready to market called to see them. Elizabeth quickly decided to show him the pigs. Knowing that Jack had asked a certain price for the pigs, she set the price, and the man after looking them over counted out the money and loaded the pigs into his wagon and drove away. Elizabeth found herself with \$48 in her possession.

When Jack came home she told him that Mr. B— had taken the pigs. When he asked how much he paid for them, she told him, but did not offer to turn over to him any of the money. When he asked her for it, she replied that she had already planned to use it for things that the home needed. Jack looked at her in amazement. What did this mean? His meek little wife daring to affront him this way? He began to fume, but Elizabeth looked steadily at him, and when he finally was discomfited by her unusual and undaunted scrutiny, and stopped storming, Elizabeth quietly defined a partnership and reminded him that a life partnership was what they had agreed to when they married, and she was sure that he would not wish to fail in abiding by the usual customs of a partnership. Jack saw the point, and after that never sold the poultry that Elizabeth had reared and pocketed the money without her instructions, and neither did Elizabeth have to resort to selling the pigs that Jack raised to get money that she needed for personal or home supplies of her own choosing. They started keeping a common account, and neither bothered the other about small purchases that either wished to make, but neither made any sizable inroads on the family account without consulting the other.—Celia S. Rozelle, Lackawanna Co., Pa.

SALT HELPS AT BUTCHERING TIME

The following suggestion may be new to some. And just now it will be handy, for there is not a more common duty on most farms now than butchering. And the housewife's part in this work is no small one. We dread the cleaning up of the grease. Soap and water seem to lengthen the job instead of facilitating it.

When it came my turn to take up this part of the fall duties, I recoiled how we can cleanse a choco-

late cup with sugar, and I wondered if there was not something that would take up the lard in the same way. Sugar is too expensive for this service, so I tried salt, and found that it worked very successfully. I scarcely needed water after rubbing the outside of the utensils with a bag containing only a small amount of salt. And the inside may be cleaned without the cloth.

We must remember, however, that salt has a tendency to rust metal if allowed to stand on it.

Salt used thus to get the grease off the utensils seems to be as cheap as soap, and besides there is the saving in time and energy.

We find our paper very interesting, and well gotten up.—Mrs. M. V. F., Clearfield Co., Pa.

(Editor's Note.—Thank you for the appreciation of the service that we are trying to render to our readers. May we ask if you have ever tried using any of the various cleaning or scouring powders for cleaning up the butchering grease? We find that the best one of these powders take up the grease very readily, forming a sort of soap emulsion by combination of the grease with the alkali in the powder. These powders are put up in tin cans, with stamped holes in the top which can easily be punched thru with any sharp pointed instrument like an ice pick or an awl, and the powder is then readily sprinkled out as you need it. These cans cost five or ten cents each, according to the brand of the powder. Get them at your grocers. We think you will find them rather more satisfactory than salt and not very expensive.—Harriet Mason).

HOME BUREAU GROWTH IN NEW YORK

On Sept. 1 the membership had reached a total of 15,754. In 1918 the membership was only 1,677. Since Sept. 1, Herkimer County bureaus have been organized with a membership of over 500, and Lewis County has brought in over 400, while organization work is progressing in eight other new counties.

Two counties, Otsego and Jefferson, have passed the goal of 1000 members that was set as a maximum for 1920. The average membership per home bureau has been steadily raised from 209.62 in 1918 to 406.6 in 1919 and to 544.72 in 1920. The following table shows the status of the membership in each home bureau on Sept. 1:

Allegany County, 269; Broome, 465; Cayuga, 486; Chemung, 441; Chenango, 721; Cortland, 620; Delaware, 436; Erie, 669; Jefferson, 1008; Monroe, 537; Nassau, 378; Niagara, 784; Oneida, 619; Otsego, 300; Orleans, 646; Oswego, 625; Saratoga, 387; Steuben, 290; Suffolk, 250; Sullivan, 490; Tioga, 574; Tompkins, 498; Ulster, 905; Wayne, 465; Westchester, 750. The two city home bureaus' membership is Buffalo, 450; Syracuse, 430.

HOMESPUN YARN

Tea, coffee and over much meat are taboo at the children's table.

Affording things is largely a matter of the way you look at it. The farm that can afford modern tools and equipment can afford running water in the house and a sewage system.

Those greens that you canned last spring taste mighty good now, don't they? How about a few more cans next season?

3404.—Good Apron Model.—It is cut in 4 sizes: Small, 32-34; medium, 36-38; large, 40-42, and extra large, 44-46 inches bust measure. A medium size will require 5 yards of 27-inch material. Figured percale, gingham, seersucker, sateen, alpaca, drill and cambric are suitable for this style. Pattern, 10 cents.

3414.—A Simple Apron With New Pocket Feature.—It is cut in 4 sizes: Small, medium, large and extra large. A medium size will require 3½ yards of 36-inch material. Gingham, linen, lawn, seersucker, drill, sateen and alpaca are attractive for this style. The pocket is stitched underneath the apron at the sides, and the flap buttons over it. The pocket may be placed over the apron if preferred. Pattern, 10 cents.

3373.—Spring Coat for Sister.—The pattern is cut in 3 sizes: 12, 14 and 16 years. A 14-year size will require 3½ yards of 42-inch material. Serge, cheviot, polo cloth, evora cloth, velours, tricotine, also pile fabrics, velvets, corduroy are suitable material. The collar may be worn high at the neck or rolled in reverse styles

as illustrated. Pattern, 10 cents. 3430.—Stylish Tailleur Costume.—The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38-inch size will require 4½ yards of 54-inch material. The width of the dress at lower edge is 1½ yard. Serge, broadcloth, tricotine, velours, velvets, satin, heathen mixtures and faile are attractive materials for this dress. Pattern, 10 cents.

If an income is to be of most use, a record must be kept of the way in which it is spent; with that knowledge one can tell whether it has been distributed wisely.

Possibly there are not enough vegetables in your family diet. The children should eat them, too.

WEAVER PIANOS

"In my old Kentucky home far away—"

JOY, sorrow, hope, fear—the whole scale of human emotions seems to be bound up in the Weaver Piano. Whether it be the grand theme of one of the world's greatest composers, or the plaintive melody of the simple folk song, it finds ready expression in the Weaver's full, clear, responsive tone and exquisite harmony.

It is this limpid, pure tone-quality that makes the Weaver so much desired by professional musicians and music lovers. It is this same quality of tone that has endeared it to thousands of American homes.

For over half a century the Weaver master artisans have been building fine instruments. They have done their work so well that today the name Weaver on a piano means perfection, as near as highly skilled human hands can make it.

To own a Weaver is to take keen satisfaction in it as a work of art. To play a Weaver is to find expression for your every mood.

Consolidated Schools

THERE is no question of greater moment concerning the welfare of our boys and girls than that of consolidated schools. The impression seems to be quite general that an effort is soon to be made to close all schools having ten pupils, or less, and convey them to some central points, where two or more schools may be consolidated.

Dr. Thomas E. Finegan, State Superintendent of Public Schools, has recently made it known that he has no such thought in mind, and that under no circumstances will he advise such action unless the school authorities recommend it. He also states that he will not approve such action if it is to work hardships upon any great number of pupils.

Knowing his position, let us discuss the question, ever keeping in mind the thought that we would not ask for consolidation unless it is recommended by a majority of the school board and has the further approval of the State Superintendent.

Continuous Term

A proposition has been made that we adopt a divided school term of eleven months. The division of the school term is not new, as the state tried this plan for years and then discarded it as being impractical and detrimental to the best interest of the child. First a five months' term, with two months in summer and three in winter was tried, then the term was lengthened to seven months, holding three in summer and four in winter. The results obtained then as compared with those under the present system, prove conclusively that a continuous term gives better results than a divided one.

Buildings and Equipment

There are few, if any, one room school houses in Pennsylvania, that have been built ten years or more, that conform with the modern laws in heating, lighting and ventilation. Many of them are a disgrace to the community in which they are located as well as a menace to the health and progress of the children.

It would be much better to build one modern building at some central point, disregarding township lines, than to build eight or ten buildings and keep them in repair. It is impossible to equip a one room school building with the apparatus needed in teaching the subjects demanded today. A modern building could be suitably equipped and the same equipment used by all of the children in the district.

Trained Teachers

One of the greatest objections to the one room school is that the school board is forced to constantly change teachers. It is a rare thing for a teacher to teach in a rural school two years in succession. If she is especially successful during her first year she usually has no trouble in securing a position in a town or city school the next at higher wages and for a longer term. Our rural schools have for years been used as training camps to prepare teachers for grade and high school work and "genius goes where the money flows." This condition can best be remedied by consolidating our schools and by electing trained teachers for a term of years, or as long as their work is satisfactory.

The suggestion that we employ teachers for eleven months, requiring them to teach primary and grade work in the one-room schools during

the summer, and then close these schools and enter the high school and teach home economics, manual training and agriculture, is too absurd to give even a passing thought. It simply cannot be done successfully. The work of the primary teacher differs widely from that of the teacher in the high school, while that in the Department of Home Economics, Manual Training and Agriculture, is separate and apart from either, requiring recognized talent and special training on the part of the teacher. It would be just as practical to ask a teacher in music to teach physics, as to ask a primary teacher to teach agriculture or manual training. No teacher has yet been found who could teach all subjects successfully. We are living in an age of specialists; one in which our boys and girls are being asked to specialize and learn to do at least one thing well. This can be done by giving them trained teachers throughout their school life.

Benefits Received by Pupils

The benefits received by pupils who have the advantage of training obtained in a first-class high school are so great that they completely overshadow the hardships encountered.

Personal contact and association have a wonderful influence in shaping the destinies of our boys and girls. It is as true of the little folks as it is of those older grown. Watch them at play in the kindergarten and you cannot help but be impressed with the spirit of rivalry and competition that is manifested at their age. The man who said "Give me the boy until he is eight years of age and I care not who has after that," understood that "The twig is bent the tree is inclined."

No hardship is too great that can be financially or physically overcome, when we consider the benefits received by the boys and girls who are brought to one central plant and given in charge of a good teacher.

Pupils who have the advantage of a first-class high school complete their school work from two to six years sooner than under the old method. During this time they remain at home and have the advantage of home influences excepting two years at normal school or four years at college.

A graduate from a first-class high school may enter the junior year in any of our normal schools and complete the course in two years, or may enter college without further examination. If graduates from one of our vocational schools, or a high school having vocational courses, they may enter State College and complete their work and get their degree in two years. Forty-two vocations in life, or a means of earning an honest and competent living, are immediately opened to the boy and girl with a high school diploma. Shall we then blind prejudice or bitter jealousy deny our boys and girls these benefits? We think not. To one who has watched the growth and development of the high school system, and helped in a small way to establish it, it is hard to conceive how any one could oppose it.

Schools are established and maintained for the benefit of the children, not for the taxpayer, nor to give teachers a job. The aim of all schools should be to train one for complete living and the modern school building is the answer to the problem.—E. B. Dorsett.

MIXING FERTILIZERS AT HOME

(Continued from Page 3).
The commercial mixed would convert this amount of nitrogen into ammonia and call it 4.4 per cent. To obtain 8 per cent phosphoric acid from acid phosphate, 16 per cent goods it requires 1000 pounds, because we want 160 pounds to get our required analysis. Muriate of potash is practically 50 per cent actual potash. We want 120 lbs. actual potash to make a 6 per cent analysis, hence if muriate of potash is 50 per cent actual potash we must have 240 lbs. of muriate. Now, when we add these ingredients we find, if we have used blood, we have 1840 lbs.; if we use fish instead of blood we have 1900 lbs. "Oh! we have not a ton," some one says. But why care, we have all the pounds of plant food and some to spare. Those pounds of plant food are all that are of any value to the farmer or his crops; but if you feel you must have a ton in weight, put in anything you have handy, until it weighs a ton.

Any formula desired can be made and mixed the same as the one here worked out in detail. First, determine what analysis you desire, then multiply that by 20 to give the number of pounds contained in the ton; next determine how many pounds of whatever ingredient you are using, it will require to give you that many pounds. For example, if we want to make a 3-8-3 mixture and derive our nitrogen content from two sources equal, using nitrate of soda for one, and say 12 per cent blood for the other, we will use 200 lbs. soda, analyzing 15 per cent or more which will give us 30 lbs.; next use 250 lbs. blood which will give us 30 lbs. more total 60 lbs., the required amount for a 3 per cent mixture. Next, for an 8 per cent phosphoric acid content we must have 160 lbs. If 16 per cent acid phosphate is used, it will require 1000 lbs. For a 3 per cent potash content, it takes 60 lbs. and muriate of potash being 50 per cent actual potash it will require 120 lbs. Now we have a high grade, 3-8-3 fertilizer, because all the ingredients used in its making are high grade but we have only 1570 lbs. for a ton this can be used just as it is, applying it thin; or some filler can be mixed with it till it weighs the ton. This fertilizer will cost for the materials used, \$30.60.

Mixing.—When ready to mix, have your formula figured out so you will know how much of each material you will need. Acid phosphate being the greatest bulk. I use half of what I need laid down first; next use your blood or fish or tankage whichever one you have decided upon, level off evenly, now build up one layer on top of the other evenly distributed. Now commence on one side of the pile and mix with an ordinary garden hoe. Hoe it over two or three times mixing it as you would concrete. When it is all of a uniform color it will do. Now screen it, I use a screen home made of 3/8-inch mesh wire set on legs at an angle of about 45 degrees. Shovel your mixture on this screen and mash all lumps that do not go thru. Now if room will permit, leave this in a pile three or four days before bagging. This will prevent any baking.

What does it cost to mix fertilizers at home? Why it costs me nothing. I have regular men after March 1 that must be paid rain or shine. When a bad day comes and outdoor work is out of the question, I put them to mixing fertilizer.—C. C. Hulsart, New Jersey.

TITAN 10-20

THIS practical favorite among tractors has long aided industriously in the cause of good American farming and it has gained as great a popularity across boundaries and oceans as well. Since the first Titan went out to the fields five years ago, the farming world has invested over seventy million dollars in Titan 10-20 Tractors. No other 3-plow tractor has approached such a record as this.

Titans at this writing are delivering reliable horse power at drawbar and belt for many thousands of owners who are done with uncertainties and who know that quality is but another name for economy.

With every Titan 10-20 Tractor purchased from us—cash or liberal terms—between now and May 1, 1921, we will give our written guarantee that if this Company reduces its price on Titan 10-20 Tractors on or before May 1, 1921, we will refund the purchaser the amount of such reduction.

Stock Raising in WESTERN CANADA
Is as profitable as grain growing. Successes as wonderful as those from growing wheat, oats, barley, and flax have been made in raising horses, cattle, sheep and hogs. Bright, sunny climate, nutritious grasses, good water, enormous fodder crops—these spell success to the farmer and stock raiser. And remember, you can buy on easy terms.
Farm Land at \$15 to \$30 An Acre
—land equal to that which through many years has yielded from 20 to 45 bushels of wheat to the acre—grazing land convenient to good grain farms at proportionately low prices. These lands have every rural convenience: good schools, churches, roads, telephones, etc., close to live towns and good markets.
If you want to get back to the farm, or to farm on a larger scale than is possible under your present conditions, investigate what Western Canada has to offer you.
For illustrated literature with maps and particulars regarding reduced railway rates, location of land, etc., apply to Department of Immigration, Ottawa, Canada, or

TALKS WITH THE BOYS

THE EDITOR'S LETTER

To the Boys:

It will not be necessary for me to take up much of our space this week because we have some letters from the real boys.

The first one to come in is a splendid article from Master "Dick" Richardson, of Bucks County, who knows a lot about birds. I hope that other boys will take the cue from this article and begin the study of bird life about their homes. His suggestions about feeding birds in winter is a good one and it will draw them about so that you will have a chance to see and know them. Let us hope that Dick will write more and tell us what kind of houses to prepare for them. It would be interesting to have some pictures to illustrate the ideas.

One boy from Dauphin County, Pa., writes to tell of his interest in the department and of the work he can do on the farm. I am sure he will make a crackerjack farmer. He says he would like to raise a big fat hog but does not know how to go about it and would like us to tell him. A man one time wrote a recipe for making rabbit broth and began it by saying, "First, catch the rabbit," and then went on to tell how to make the soup. So, to this boy we would say: first, get a little pig. That will be up to him, but I am sure a good, five farm boy will soon solve that problem. Then we want some of the Pig Club members to tell us just how they raise their pigs.

A letter from a grown-up this morning contains the following as a P. S.:

"Your department for the boys is great but you can put up all the notices you want to about it being for the Boys and the Editor exclusively, you cannot keep us 'older boys' from reading that page. So there!" That is good. I hope the "older boys" will read it because I should not wonder if they will occasionally find something in it they should know—especially the men who never were boys, or have forgotten that they were.

Now that is all the space I will take this time. The thing is going on with a bang. I have always found that you could depend upon farm boys to come up to the scratch.

Smiley The Editor

P. S.: You will note that the writer of one of the letters on this page says that his sisters think the girls should have a department also. Well, they are right, and just as soon as we can get to it they shall have it. I don't believe in treating either one better than the other in the home and that principle should hold in a paper as well.

LIKES TO TRAP

Dear Editor—I am glad that the Pennsylvania Farmer is going to have a space for the boys and the Editor. How nice it will be and I wish our page much success.

My sisters say they can't see why all our farm papers must publish a page for boys. They think girls are more important but we don't think so do we? Anyway, I'm glad you are going to give us a place in your paper.

I am a genuine farmer boy of 13

I live on an \$6-acre farm. I love school and my teacher. I am in the seventh grade. I have a mile to walk to school every morning and evening except rainy days I am taken to and from school. I have eight books.

I love to trap and love nearly all out-of-doors work. But trapping does not pay very well this year. I had traps set two nights and caught a skunk. It was a large one and nearly black—had two white stripes over its head. Last year one like that brought about \$5. I caught this one late in December, 1920, and sold it for \$1.50.

Well, don't you think I have said enough on my first visit? I hope some more of our farm boys will write. It will help to make our page more interesting.

With my best wishes for your happiness, health and wealth in the New Year.—Simon R. Snyder, Lancaster Co., Pa.

SOME WINTER VISITORS AND HOW TO KNOW THEM

Of the various birds that may be seen at one time or another in Pennsylvania the winter visitors are very interesting for the reason that they are easier to make friends with and study than some others. This is largely because of the scarcity of the food they eat. For, if one takes time and trouble to put out food and shelter for the birds in winter when the weather is bad, and when the "high cost of living" is carrying things with a high hand in Birdland, he will surely be repaid for his labors.

Hemp, sunflower and millet seeds are well liked by many birds. Suet is also a favorite food and should be a large part of the provisions of a birds' "free lunch counter." This suet may be fastened on trees very nicely by nailing inch mesh wire netting over it. The birds will then eat thru the netting and one bird cannot fly off with the whole piece of suet at once.

The chickadee, a little, gray, black-capped fellow, will probably be one of the first visitors to the suet lumps. He is one of the tamest of our birds and it is quite easy to get acquainted with him.

Another common winter visitor is the tufted titmouse. This little fellow is bluish gray above and white underneath, with chestnut streaks on his sides and a little crest on his head. He also is quite tame and will soon come to get food. He and the chickadee are very amusing while eating suet that is fastened on the end of a branch. They will hang in almost any position during the meal, often hanging head downward.

The white breasted nuthatch is as much of an acrobat as these, for he always faces the way he is going on the trunk of a tree, whether it be up or down. Unlike the chickadee and titmouse, he is more a creature of the tree-trunks than the branches.

A common bird that is nearly always with us, both winter and summer, is the downy woodpecker, and his cousin, the hairy woodpecker, who is three inches longer, may often be seen all the year round in the country, creeping up and down the tree trunks in search of bugs. Although he is very fond of these bugs, Mr. Downy is also fond of suet and it will not be long after the placing

of it before he will be displacing it to his own satisfaction.

One of the prettiest of the few of our feathered friends which visit us in this coldest season of the year is the white-throated sparrow. He is very sparrow-like in his general coloring but he has a white throat and a richer more reddish brown on his body than the more common varieties. In winter you often see him hopping about on the leaves scratching for food. He is fond of seeds and will probably come to eat the hemp, sunflower, millet and other seeds that are put out for him. His cousin, the song sparrow, is occasionally with us in both summer and winter, though he likes Pennsylvania better in summer. A food that is well liked by song sparrows on a cold day is a mixture of rolled oats and suet. This may be spread on a board which is placed within easy reach of the birds.

The slate-colored junco is, as his name suggests, slate-colored on his back and wings and around his neck. His distinctive mark is the pair of white outer tail feathers which show up very well when he flies.

You may be sure that these winter friends will more than repay in many ways all kindness done to them.—Russell Richardson, Jr., Bucks Co., Pa.

BOYS AT THE STATE SHOW

The boys from the farms of Pennsylvania will play an important part in the fifth annual State Farm Products Show, to be held in Harrisburg, January 25-28. One hundred and thirty boys, representing every section of the state, will be guests of the Pennsylvania Department of Agriculture and the Y. M. C. A. during the show, and while here will take part in the annual corn judging contest, which is one of the features of the show.

Each agricultural vocational school in the state will send a team of two boys. There are 37 of these schools, while one team will represent each of the 16 high school agricultural departments. In addition, one team will be sent by each county supervisor of agriculture, making thirteen of these teams.

There will be a vocational school exhibit as a part of the show, and this will illustrate the work that is being carried on in the vocational schools scattered thruout Pennsylvania, where agriculture is taught.

The boys who come to the show from each school are selected on account of their ability displayed in corn judging and the trip to Harrisburg is in recognition of their meritorious work during the year.

The boys will arrive Tuesday morning, January 25, and will be quartered at the Y. M. C. A. The Pennsylvania Department of Public Instruction will have competent agricultural teachers in charge of the boys during their entire visit at the show.

Each morning they will be awakened at 6 o'clock, have breakfast at 7 and then follow the day's program, which includes visiting the Legislature, meeting Governor William S. Sprunt, Secretary of Agriculture Fred Rasmussen, and other state officials. They will visit the various departments of the State Farm Products Show and in the evenings, entertainment will be provided.

On Wednesday morning, Jan. 26, the annual corn judging contest will be held and the large silk banner will be awarded to the school represented by the winning team. Three individual prizes will also be awarded.

PASSING EVENTS IN PICTURES

1—The busiest Railroad Crossing in the World is that of the Chicago Elevated Railways at Lake and Well Streets.

2—Great New 16-inch Gun that can Hurl Shell Weighing 2700 pounds, 35 Miles.

7—Two years ago, little Leo was left an orphan, and this motherly Collie adopted him. He seems to have brought the lion up right, because Leo still respects his stepmother, although he is a full grown lion.

8—Miss Hope Hampton, Movie Actress, in her \$100,000 sable coat.

SYNOPSIS

Dan Tailing had just received from his physician the unwelcome information that he had but six months to live. Altho descended from a long line of hardy pioneers, his life had been spent in the city where refinement is an office had destroyed the physical foundation which his forebears had laid. He strolled out to the city park, seated himself on a bench where he made the acquaintance of a squirrel. The squirrel's antics awoke a latent love and a preoccupation for the things of Nature and he suddenly resolved to spend his last six months in the forests of the Northwest where his grandfather had lived. He sets at once upon this resolve and he is soon in the virgin forests of that great country. He is fortunate in becoming acquainted with a home owned by a man who knew and loved Dan's grandfather. A dancer, nicknamed Snowbird, is also a member of the family.

(Continued From Last Week)

CHAPTER II

As all real woodsmen know, there is no other object in the material world that glints exactly like a gun barrel in the light. It has a look all its own. It is even more distinctive in the sunlight, and now and again men have owed their lives to a momentary glitter across a half-mile of forest. Of course, the ordinary, peaceful, God-fearing man, walking down a trail at night, likely would not have given the gleam more than an instant's thought, a momentary breathlessness in which the throat closes and the muscles set; and it is more than probable that the sleeping senses would not have interpreted it at all. But Hildreth was looking for trouble. He had dreaded this long walk to the settlements more than any experience of his life. He didn't know why the letter he had written, asking for an armed escort down to the courts, had not brought results. But it was wholly possible that Cranston would have answered this question for him. This same letter had fallen into a certain soiled, deadly pair of hands which was the last place in the world that Hildreth would have chosen, and it had been all the evidence that was needed, at the meeting of the ring the night before, to adjudge Hildreth a merciless and immediate end. Hildreth would have preferred to wait in the hills and possibly to write another letter, but a chill that kept growing at his finger tips forbade it. And all these things combined to stretch his nerves almost to the breaking point as he stole along the moonlit trail under the pines.

A moment before the rush and whirl of the grouse flock had dried the roof of his mouth with terror. The tall trees appalled him, the shadows fell upon his spirit. And when he heard this final sound, when he saw the glint that might so easily have been a gun-barrel, his nerves and muscles reacted at once. Not even a fraction of a second intervened. His gun flashed up, just as a small-game shooter hurls his weapon when a mallard glints above the decoys, and a little, angry cylinder of flame, darted, as a snake's head darts, from the muzzle.

Hildreth didn't take aim. There wasn't time. The report roared in the darkness; the bullet sang harm-

The Voice of the Pack

by Edison Marshall

lessly and thudded into the earth; and both of them were the last things in the world that Cranston had expected. And they were not a moment too soon. Even at that instant, his finger was closing down upon the trigger, Hildreth standing clear and revealed thru the sights. The nervous response that few men in the world would be self-disciplined enough to prevent occurred at the same instant that he pressed the trigger. His own fire answered, so near to the other that both of them sounded as one report.

Most hunters can usually tell, even if they cannot see their game fall, whether they have hit or missed. This was one of the few times in his life that Cranston could not have told. He knew that as his finger pressed he had held as accurate a "head" as at any time in his life. He did not know till another circumstance—that in the moonlight he had over-estimated the distance to the clearing, and instead of one hundred yards it was scarcely fifty. He had held rather high. And he looked up, unknowing whether he had succeeded or whether he was face to face with the prospect of a duel to the death in the darkness.

And all he saw was Hildreth, rocking back and forth in the moonlight—a strange picture that he was never entirely to forget. It was a motion that no man could pretend. And he knew he had not missed.

He waited till he saw the form of his enemy rock down, face half-buried in the pine needles. It never even occurred to him to approach to see if he had made a clean kill. He had held on the breast and he had a world of confidence in the great, shocking, big-game rifle. Besides, the rifle fire might attract some hunter in the hills, and there would be time in the morning to return to the body and make certain little investigations that he had in mind. And running back down the trail, he missed the sight of Hildreth dragging his wounded body, like an injured hart, into the shelter of the thickets.

CHAPTER III

Whisperfoot, that great coward, came out of his brush-covert when the moon rose. It was not his usual rising time. Ordinarily he found his best hunting in the eerie light of the twilight hour; but for certain reasons, his knowledge of which would be extremely difficult to explain, he let this time go by in slumber. The general verdict of mankind has decreed that animals cannot reason. Therefore it is somewhat awkward to explain how Whisperfoot knew that he needn't be in a hurry, that the moon would soon be up, and the deer would be feeding in their light. But know all these things he did, act upon them he also did, and it all came to the same end. Whether or not he could reason didn't affect the fact that a certain chipmunk, standing at the threshold of his house to glimpse the moonlit forest, saw him come slipping like a cloud of brown smoke from his lair a full hour after the little creature had

every right to think he had gone to his hunting—and straightaway tumbled back into his house with a near attack of heart failure.

But the truth was that the chipmunk was presuming upon his own desirability as food. His fear really wasn't justified. It would not be altogether true to say that Whisperfoot never ate chipmunks. Sometimes in winter, and sometimes in the dawn after an unsuccessful hunt, he ate things a great deal smaller and many times more disagreeable than chipmunks. But the great cat is always very proud when he first leaves his lair. He won't look at anything smaller than a horned buck. He is a great deal like a human hunter who would kill two deer a week for fifty-two weeks would be called a much uglier name than poacher; but yet this had been Whisperfoot's record, on and off, ever since his second year. Many a great buck wore the scar of the full stroke—after which Whisperfoot had lost his hold. Many a fawn had crouched panting with terror in the thickets at just a tawny light on the gnarled limb of a pine. Many a doe would grow great-eyed and terrified at just strange, pungent smell on the wind.

Whisperfoot had slept almost since dawn. It is a significant quality in the felines that they simply cannot keep in condition without hours and hours of sleep. It is true that they are highly nervous creatures, sensualists of the worst, and living intensely from twilight to dawn; and they burn up more nervous energy in a night than Urson, the porcupine, does in a year. In this matter of sleeping, they are in a direct contrast to the wolves, who seemingly never sleep at all, unless it is with one eye open, and in still greater contrast to the king of all beasts, the elephant, who is said to slumber less per night than that great electrical wizard whom all men know and praise.

The great cat came out yawning, as graceful a thing as treads upon the earth. He was almost nine feet long from the tip of his nose to the end of his tail, and he weighed as much as many a full-grown man. And he fairly rippled when he walked, seemingly without effort, almost without resting his cushions on the ground. He stood and yawned insolently, for all the forest world to see. He rather hoped that the chipmunk, staring with beady eyes from his doorway, did see him. He would just as soon that Wolf's little son, the bear cub, should see him too. But he wasn't so particular about Wolf himself, or the wolf pack whose song had just awakened him. And above all things, he wanted to keep out of the sight of men.

For when all things are said and done, there were few bigger cowards in the whole wilderness world than Whisperfoot. A good many people think that Graycoat the coyote could take lessons from him in this respect. But others, knowing how a hunter is brought in occasionally with almost all human resemblance gone from him because a cougar charged in his death agony, think this is unfair to the larger animal. And it is true that a full-grown cougar will sometimes attack horned cattle, something that no American animal cares to do unless he wants a good fight on his paws and of which the very thought would throw Graycoat into spasms; and there have been even stranger stories if one could quite believe them. A certain measure of respect must be extended to any animal that will hunt the great elk, for to miss the stroke and get caught beneath the churning, lashing, slashing, razor-edged front hoofs is simply death, painful and without delay. But the difficulty lies in the fact that these things are not done in the ordinary, rational blood of hunting. What an animal does in its death agony, or to protect its young, what great game it follows in the starving times of winter, can be put to neither its debit nor its credit. A coyote will charge

when cornered. A hen will peck at the hand that robs her nest. When hunting was fairly good, Whisperfoot avoided the elk and steer almost as punctiliously as he avoided men, which is saying very much indeed; and any kind of terrier could usually drive him straight up a tree.

But he did like to pretend to be very great and terrible among the smaller creatures. And he was Fear itself to the deer. A human hunter who would kill two deer a week for fifty-two weeks would be called a much uglier name than poacher; but yet this had been Whisperfoot's record, on and off, ever since his second year. Many a great buck wore the scar of the full stroke—after which Whisperfoot had lost his hold. Many a fawn had crouched panting with terror in the thickets at just a tawny light on the gnarled limb of a pine. Many a doe would grow great-eyed and terrified at just strange, pungent smell on the wind.

He yawned again, and his fangs looked white and abnormally large in the moonlight. His great, green eyes were still clouded and languorous from sleep. Then he began to steal up the ridge towards his hunting grounds. Dry as the thickets were, still he seemed to traverse them with almost absolute silence. It was a curious thing that he walked straight in the face of the soft wind that came down from the snow fields, and yet there wasn't a weathercock to be seen anywhere. And neither had the chipmunk seen him wet a paw and hold it up, after the approved fashion of holding up a finger. He had a better way of knowing—a chill at the end of his whiskers.

In fact, the other forest creatures did not see him at all. He took very great precautions that they shouldn't. Whisperfoot was not a long-distance runner, and his whole success depended on a surprise attack, either by stalking or from ambush. In this he is different from his fellow cowards, the wolves. Whisperfoot catches his meat fresh, before terror has time to steal out of the heart and poison it; and thus, he tells his cubs, he is a higher creature than the wolves. He kept to the deepest shadow, sometimes the long, strange profile of a pine, sometimes just the thickets of buckbrush.

And by now, he no longer cared to yawn. He was wide awake. The sleep had gone out of his eyes and left them swimming in a curious, blue-green fire. And the hunting madness was getting to him; that wild, exultant fever that comes fresh to all the hunting creatures as soon as the night comes down.

The little, breathless night sounds in the brush around him seemed to madden him. They made a song to him, a strange, wild melody that even such frontiersmen as Dan and Lennox could not experience. A thousand smells brushed down to him on the wind, more potent than any wine or lust. He began to tremble all over with rapture and excitement. But unlike Cranston's trembling, no wilderness ear was keen enough to hear the leaves rustling beneath him.

His excitement did not affect his hunting skill at all. In fact, he couldn't succeed without it. A human hunter with the same excitement and fever, would have been rendered impotent long since. His aim would be shattered, he would make false steps to frighten the game, and not even Urson, the porcupine, would really have cause to fear him. The reason is rather simple. Man has lived a civilized existence for so long that many of the traits that make him a successful hunter have to be

A Story for Children

The Story of the Clock

"COME, BETTY," said Mother, "put away your dolls. It is time for bed."

"Oh, mamma," pleaded Betty, "I don't want to go to bed yet. I'm not a bit sleepy."

"But, Betty, look at the clock. The hands are pointing to 7 and you know that is bedtime."

"Horrid old clocks! I wish they'd all stop and never go again," muttered Betty as she tucked Matilda and Josephine into the carriage in which they slept.

"Tick-tock, tick-tock," sounded the dining room clock in the night, and in the quietness its voice seemed to grow louder and louder.

"What's the matter?" inquired the kitchen clock from its shelf. "You seem to be angry."

"Didn't you hear what Betty said before she went to bed? I think I'll stop and see how she likes it."

"Well, if you stop, I'll stop," answered the kitchen clock.

The tall grandfather's clock in the hall paused to listen to the conversation. "If they are both going to stop, I'll stop too. I am quite tired ticking day and night and would like a rest."

Betty opened her eyes. How quiet the house was! But it was quite light and must be time to get up. She slipped into mother's room. Mother was wide awake, but still in bed. Isn't it time to get up?" asked Betty. "I don't know, dear; the clocks have all stopped."

Betty dressed and ran downstairs, from a covert from which Bert Cranston had poached her—and he felt the lie in one bound.

Terrified though he was by the rifle shot, still Whisperfoot sprang. But the distance was too far. His outstretched paw hummed down four feet behind Blacktail's flank. Then forgetting everything but his anger and disappointment, the great cougar opened his mouth and howled.

Howling, the forest people knew, never helped one living thing. Of course this means such howls as Whisperfoot uttered now, not that deliberate long singsong by which certain of the beasts of prey will sometimes throw a herd of game into a panic and cause them to run into an ambush. All Whisperfoot's howl of anger achieved was to frighten all the deer out of his territory and render it extremely unlikely that he would have another chance at them that night. Even Dan and Lennox, too far distant to hear the shots, heard the howl very plainly, and both of them rejoiced that he had missed.

(Continued Next Week).

HE LOST COUNT

A certain instructor in mathematics is, like many other professors, of a very absent-minded turn. The father of half a dozen children, he is often oblivious of his domestic treasures. On Sunday morning, he was returning from divine service with his wife, when a youngster rushed up to him exclaiming: "Genevieve's tumbled into the canal!"

A worried look came to the professor's countenance. Turning to his wife, he said: "Have we a Genevieve, my dear?"

No breakfast ready. "You see I didn't know what time it was. All the clocks have stopped," explained Hannah.

When Betty had finished her breakfast she put on her hat and ran down the street to call for her little chum, Pearl, to go to kindergarten. "Why, Betty, you are very late," said Pearl's mother. "Pearl has been gone some time."

Betty hurried down the street. Not a child in sight. No one on the playground. She crept up under the window and listened, then turned and ran home, the tears trickling down her cheeks.

"I'm sorry, little daughter," said Mother, "but I had no way of telling the time."

"Do you think it's anywhere near 1 o'clock?" asked Betty a few hours later. "You know, Uncle James promised me a ride if I came at 1."

"You'd better run over and see," said mother.

But alas for poor Betty! She ran around the corner just in time to see Uncle James disappear in the distance.

"Betty, Betty, wake up!" and Betty opened her eyes to find Mother standing by her bedside.

She sat up and listened intently, then threw her arms around Mother's neck, exclaiming, "Oh, I'm so glad it was only a dream!"

And before she ate her breakfast Betty crept over to the clock and whispered: "I'm sorry I called you names. I'll never do it again."

EVERY INCH A MAN

She sat on the porch in the sunshine As I went down the street— A woman whose hair was silver, But whose face was blossoms sweet, Making me think of a garden, Where, in spite of the frost and snow Or bleak November weather, Late, fragrant lilies grow.

I heard a footstep behind me, And the sound of a merry laugh, And I knew that the heart that it came from

Would be like a comforting staff In the time and hour of trouble, Hopeful and brave and strong, One of the hearts to lean on When we think all things go wrong.

I turn at the click of the gate-latch And meet his manly look; A face like his gives me pleasure, Like the page of a pleasant book. It told of a steadfast purpose Of a brave and a daring will, A face with a promise in it, That God, grant the years fulfill.

He went up the pathway singing, I saw the woman's eyes Grow bright with a worldless welcome

As sunshine warms the skies, "Back again, sweetheart mother," He cried and bent to kiss That loving face that was lifted For what some mothers miss.

That boy will do to true depend upon; I hold that this is false— From lads in love with their mothers, Our bravest heroes grew Earth's grandest hearts have been loving hearts

Since time and earth began; And the boy who kissed his mother Is every inch a man.

Natco Dairy Barns Are Warm in Winter

NATCO barns are warm in winter, yet cool in summer. They provide year-round comfort for your cows. More comfort in the stable means more milk in the pail—more money in the bank.

The hollow spaces in a glazed Natco Hollow Tile wall provide a blanket of still air through which heat, cold or dampness will not pass.

And the cost? Perhaps a little more at first, but far less in the end than for other construction. The saving in insurance and upkeep will repay the added investment within a few years. All further savings are clear profit.

Whatever you intend to build, our book, "Natco on the Farm," will offer helpful suggestions. Write for it today—no charge.

Ask your building supply dealer to quote you prices on Natco Hollow Tile.

WINTER FEEDING AND MANAGEMENT OF BROOD SOWS

The success or failure of the spring crop of pigs will depend to a large extent upon the method of feeding and management that is followed during the winter. If the brood sows do not receive the proper care during the gestation period the owner should not expect a strong healthy crop of pigs. The first essential is to see that all the sows are bred and that it is done at as near the same time as possible without overworking the herd bear or having too many litters come on the same day. Early spring pigs will as a rule develop better and are more satisfactory than late spring or early summer pigs.

The quarters in which the brood sows are kept is important. The place should be comfortably warm and dry. It is not necessary to have expensive buildings, but a place where the sows will not suffer from cold and rain or snow is necessary. If early spring pigs are raised it is necessary to have a warm, dry barn of some kind to be used as a farrowing house. The pigs cannot be farrowed in a house that is cold, dark and damp and be expected to develop rapidly. If they can be kept in a warm dry place for a few days after farrowing they will usually withstand the spring cold without trouble.

Sows that have been bred for spring farrowing should be separated from the balance of the herd. Open or bred gilts should be kept in a separate lot from mature sows as they as a rule require more home building material than the mature sows. Pigs or shoats that are being fattened for market should never be kept with the brood sows. They require a ration that is more fattening in character and can also be confined to a smaller lot than brood sows. Mature sows and bred gilts require a ration that carries plenty of bone and muscle building material. This is not so essential for the proper maintenance of the brood sows but for the proper development of the unborn pigs.

Exercise is fully as important as the sleeping quarters and the feed which the sows receive. It is practically impossible for a brood sow to produce a strong thrifty and healthy litter if she does not get a certain amount of regular exercise during the gestation period. Exercise is not only conducive to producing a strong litter of pigs, but the sow is in better physical condition and will recover much sooner from the effect of farrowing.

Brood sows and gilts will as a rule take sufficient exercise if allowed to range over quite an area and not supplied with too much feed. If the range is limited or there is too much snow for the sows to get out in the field, scatter a small amount of grain or unhusked corn over the snow and let the sows work this over daily for their exercise. If possible to do so, feed the sows some distance from their sleeping quarters as such practice will result in enforced exercise.

Brood sows require a liberal supply of clean drinking water and should be encouraged to drink enough to satisfy their appetite. If the water is cold they will as a rule not

drink as much as their system demands. If it is convenient to do so it is desirable to remove the chill from cold water. If the chill has been removed the sows will relish the water to a greater extent and drink all the system demands.

In feeding the brood sows there are two important factors to be kept in mind. In the first place the feed should be of such a character as to meet the body needs of the animal and also to meet the needs of the developing embryo. In the second place such feeding must be economical.

The kind and amount of feed to allow will depend upon the condition of the sow and the feeds that are available. If the sows are in good condition of flesh at breeding time a lighter ration is required than if the sows are in thin condition of flesh. Sows that are in fair condition of flesh at breeding time and gain from 1 to 1 pound per head daily during the gestation period will not be too fat at farrowing time and do not become too thin while the pigs are suckling.

Corn alone is not a desirable feed for brood sows and when fed alone the crop of pigs farrowed are a disappointment. Corn can form the major portion of the ration but must be properly supplemented with a protein feed. A ration consisting of 8 to 9 parts of corn and 1 part of digester tankage makes a desirable ration for sows. The only objection to such a combination is that it is too concentrated for brood sows. The addition of about 20 per cent of ground oats will improve such a ration so it makes a more bulky combination. Brood sows that receive the grain ration might have access to a liberal allowance of alfalfa hay or good clover hay placed in a rack. It is surprising the amount of hay a group of brood sows will consume, and it has a tendency to keep the sows in good physical condition. The amount of feed to allow per head or per 100 pounds of live weight daily will vary—mature sows should receive about 1 pound of grain daily for each 100 pounds of live weight. Yearling sows and gilts should receive about 1 1/2 pounds of grain daily for each 100 pounds of live weight. In addition to this grain allowance the sows should have access to some nice clean alfalfa or clover hay. Brood sows handled in this manner will usually farrow a good strong litter of pigs that will not be difficult to raise.

JUDGING CONTEST AT PENNA. STATE COLLEGE

The third annual live stock judging contest for students of the freshman class and first year two-year men at the Pennsylvania State College will be held during the last two weeks of the first semester, January 17-29, 1921.

Suitable prizes, in the form of gold medals, have been contributed by well-known Pennsylvania live stock breeders and agricultural publications. The medals for the best judge of all classes of livestock are offered by the Pennsylvania Farmer, Philadelphia, and the National Stockman and Farmer, Pittsburgh. Sheep med-

Get your seed potatoes of Salzer this year and have a bumper crop. Honestly, you can't afford to waste land and labor on "scrub" seed when vigorous, healthy, pure-bred seed like Salzer's will pay for itself many times over in better yield and quality.

We are American Headquarters for field seeds: Alfalfa, Clover, Timothy, Sudan, White Sweet Clover, Oats, Barley, Corn, Billion Dollar Grass; but in nothing is our leadership more pronounced than in Potatoes.

We guarantee all Salzer Flower and Vegetable Seed to be satisfactory to you or will refund full purchase price.

Write for catalog and you will understand why Salzer's Seeds are best to buy.

als are donated by R. L. Munce, Washington, Pa., and the More Sheep More Wool Association of the United States, Philadelphia, Pa. Medals for horse judging are offered by J. N. Conyngham, Wilkes-Barre, and Delchester Farms, Edgemont, Pa. The cattle judging medals are offered by Schaffner Brothers, Erie, and Alex Warner, Titusville. For the swine judges, medals are contributed by Mrs. E. B. Friteche, Douglassville, and George S. Barnhart, Greensburg, Pa.

There are more than one hundred and fifty freshmen and about the same number of first year two-year men who will participate in these contests. Separate contests will be held for the two classes of students and a sufficient number of rings of the various breeds of live stock will be judged to test the judging ability of the students competing.

GETTING WINTER FURS

Because mid-winter furs are the prime and most valuable, trappers should make a special effort to get a large number at this time. It means exposure to cold weather and strenuous work, but the monetary returns are good if the trapper is successful in making very many catches.

Too many trappers, farmers and would-be trappers make a failure of winter trapping, and becoming discouraged, quit just about the time the furs are worth the most money. The reason is the animals begin to live and travel under the ice of streams and ponds, or stay in their dens, as the shunk does, and the trapper thinks it impossible to catch them. Some young trappers are at a loss to know what becomes of the fur animals in mid-winter; because there are no tracks in evidence they think the fur bearers have migrated or become "trapped out." As a matter of fact, the animals have merely retreated to their winter haunts, which is not quite the same as the whole country-side which they rove over in the warm weather of spring and fall.

After the ice freezes in the early winter, the water invariably lowers and the ice sags in the middle, leaving a large air space along the banks. These places furnish runways for water animals like the muskrat and mink. By cutting a hole thru the ice, tracks will be observed if there are any animals present and traps may be set accordingly. For instance, I would recommend a blind set for mink and bait for muskrat. A fish bait should attract the mink, but it is advisable to have to use in connection a blind set nearby. The 115-triple clutch trap is an excellent under-ice trap, especially in places where the animal is not apt to drown. In cold weather animals are more apt to twist a foot off and escape—Dick Wood.

A FOREIGN CHILD

In Philadelphia they tell a story of the young matron whose social duties left her little time for her offspring. One day one of the children fell ill, and the mother summoned the family physician. She met him at the door.

"Doctor," she said, "I do wish you'd find out what is the matter with Marie. The French maid left this morning, and there's no one in the house who can understand what the poor child says."

The highest form of salesmanship is nothing but service.

Thorough Seedbed-Maker for Either Horses or Tractor

WHETHER the plant gets the proper start to make it strong and vigorous depends on the seed bed. A seed bed made with a John Deere Syracuse Spring Tooth Harrow promotes rapid plant growth. It gets you the big crops.

JOHN DEERE SYRACUSE SPRING TOOTH HARROW

The sharp-pointed teeth on the Syracuse penetrate to the depth desired, bring the lower soil to the top, break it up and mix it thoroughly, leaving it in a fine, loose, mellow condition. In this loose state it is well aerated, warms quickly, and offers every inducement to quick seed-germination.

Beside making a good seed bed, the Syracuse does another important thing—it destroys weeds. It tears out underground roots and root stems, and kills the weeds before they

get a start. Using the Syracuse thoroughly before planting corn is worth two cultivations after the corn comes up.

The Syracuse Spring Tooth Harrow is of rigid and substantial construction throughout. Its frame, tooth-bars, and teeth are made of special high grade steel. The teeth have no bolt holes to weaken them.

Any number of sections can be furnished to meet your needs. A special hitch also adapts this tool for tractor use.

Write today for a booklet describing these harrows. Address John Deere, Moline, Illinois, and ask for Package SH736

Coldest winter days are warm as toast in the home that has an Andes One Pipe

"It certainly does a boy's heart good to have a letter like this from mother"

I BELIEVE the most appreciated gift I ever gave father and mother was that Andes One Pipe Furnace. And I can't blame them a bit for being so tickled with it, because it just seemed to change that old house that had always been so cold and draughty in winter into the nicest, warmest, most comfortable place you can imagine.

Mother has something nice to say about it in practically every letter. She and father have always joked about going South, where it's warm, to spend the winter, but now she says she doesn't want to go. The Andes has transformed the house and they are just as comfortable and cozy as they can be, no matter how cold it is outdoors.

If I were going to tell anyone about the Andes, there are four things I would mention. First, the beautiful heat it gives; second, the fact that it can be installed and be in complete working order inside of twenty-four hours, without any of the confusion or expense of ripping open floors and walls to put heat pipes in; third, that it always saves fuel money, having sometimes cut down fuel bills as much as one-third and even one-half; and fourth, that the Andes people give you a guarantee like this—if you are not absolutely satisfied with your Andes System One Pipe Furnace, it will be taken out and the full purchase price returned to you.

And then I would point to the hundreds of testimonial letters that have been received, and show pictures of houses where the Andes has been installed. For instance, the picture of the house on this page is reproduced from a photograph of Mrs. Mary Warman's house in Pen Argyle, Pa. Mrs. Warman says: "Gentlemen: My house is hard to heat, but with the Andes One Pipe I find it properly heated all over. The Andes is very economical in use of coal."

Unless you have an actual furnace in front of you, it's

ANDES
SYSTEM
ONE PIPE FURNACE
"Better Heating for Less Money"

"—and I want most especially, my dear boy, to thank you for the Andes One Pipe Furnace you put in for your father and me. I don't know what we should do without it. The house is lovely and warm all the time and your father says the furnace doesn't burn nearly as much coal.
With love Mother

"Tell him it saves fuel money, too"

pretty hard to explain the details that make it a coal-saver, but this may give you an idea.

In order to give good heat, a One Pipe Furnace must have good circulation, and this circulation depends on what is called the inner casing. If this inner casing gets hot, it slows down the circulation or almost stops it, so you see it is an important part of the furnace. Most inner casings are made of black iron lined with asbestos, but in spite of being lined with asbestos, they get hot and hurt the circulation.

The Andes inner casing has two walls of galvanized iron with a dead air space between, and it doesn't get hot or let heat through, so that circulation is always good. If the circulation is poor you can burn coal and burn coal without heating the house, but in the Andes One Pipe you get all the benefit there is in every pound of fuel.

The Andes can be installed in twenty-four hours

If there is an Andes

In Andes makes this house snug and warm no matter what storms may rage dealer in your town, he can tell you a lot more about the Andes, but if not, and if you want a good, dependable heating system, I'd advise you to write to Phillips & Clark and ask for a copy of their free book, "Better Heating for Less Money." If you write today, you ought to get it in two or three days time.

Providing Pure Fresh Air in the Barn

Directions for Installing a System to Insure a Well Ventilated Stable—By Harley M. Ward

BARN ventilation is necessary to regulate temperature, to remove moisture and manure odors, and to provide pure air. Air once breathed, as is harmful to cattle when breathed a second time, as it is to human beings. We are all familiar with the evil effects that a poorly ventilated room has on the general vigor of a human body. The effect on animals is similar. In states where it is necessary to keep animals in the barn during the long winters, and especially in dairy barns where cattle must be given the best of care to secure the greatest financial returns, a ventilation system is absolutely essential.

The King system of ventilation, devised by Professor F. H. King, is a system which has come to be generally adopted for barn ventilation. This system of ventilation has been widely used in all climates and has proven as satisfactory as can be expected from a partially automatic system. No ventilating system yet devised is entirely automatic and the King system will need some attention.

In northern parts of the country the temperature is at times so low that an adequate supply of air cannot be supplied, but under general temperature conditions it is possible to ventilate the barn adequately, if the proper attention is given to the King system.

The efficiency of this system of ventilation depends on the location, size and straightness of the intake flues and outlet flues, practically airtight, non-conducting walls and ceiling, and good tight doors and windows.

The fresh air enters the intake flues, passes

between the studding, and enters the barn directly below the ceiling. As in any natural or automatic system of ventilation, no provision can be made to warm the incoming air except the heat supplied from the bodies of the animals. The fresh air brought in must, therefore, be warmed by mixing with the warm air in the barn at the ceiling before it is breathed by the cattle.

These fresh air intakes are located at intervals along the side of the barn wall. The minimum length of the flue must be three feet to guard against air flowing outward. It is very important that the inlet flue be covered with fine wire screen to prevent it from becoming obstructed. A damper should be arranged to open and close so as to prevent drafts and to keep the stable from becoming too cold during the winter season. A register, similar to those used for a hot-air furnace, may be installed in place of the damper.

Foul-air flues are made of either galvanized iron, insulated, or of paper and lumber. The design of these flues is of the greatest importance to the success of the King system of ventilation. They should be as straight as possible, for every turn or bend reduces the carrying capacity of the flue. If necessary to pass around a bend, the flue should be enlarged so that its capacity will not be reduced. As the ventilating flue acts as a chimney, it should have the same qualities. It should rise above the highest part of the building in order to receive the full force of the wind, for the velocity of the wind helps to make the flue "draw."

The location of the outlet flues is important.

They should not be too close to the heads of any of the animals, as all foul air passes directly by these animals and is breathed by them. The outlet flue should not be near the door where the opening of a door would break the drawing action of the flue.

In this system the total area of the outlet flue should practically equal the area of the inlet flues. The doors and windows should be tight so that the system will be efficient.

In figuring the size of flue the number of animals should be carefully considered. The following table taken from King's Physics of Agriculture will be found to be of service in computing the size of the inlet and outlet flues.

Amount of air required for barn ventilation:
For horses 71 cu. ft. per animal
For cows 59 cu. ft. per animal
For swine 23.3 cu. ft. per animal
For sheep 15.3 cu. ft. per animal

Assuming that air travels thru a flue from a stable at the rate of 250 to 300 feet per minute, we may determine the size of outlet and inlet as follows:

Total number of cubic feet of air required, divided by 300, multiplied by 144 (square inches in 1 square foot) equals total cross sectional area in square inches of inlets or outlets.

Total cross sectional area of inlets divided by the number of inlets equals cross-sectional area of each inlet.

Total cross-sectional area of outlets divided by the number of outlets equals cross-sectional area of each outlet. Make outlets a little larger than inlets.—Harley M. Ward, Wheaton, Ill.

A Dry, Light, Well Ventilated and Sanitary Barn is More Profitable and Gives Greater Satisfaction

UNITED STATES CREAM SEPARATOR

Latest Models
with Perfected
Disc Bowl

FACTORY
YOU

SAVE
\$25 TO \$40

Until
April 1st.

DEMONSTRATION OFFER

What size separator do YOU use? Here is your chance to get a *United States* with all the latest improvements—the perfected disc bowl and all—at a saving of \$42, \$28, \$25, or \$22, depending on capacity.

A few live dairymen in every community are going to snap up this greatest cream separator value ever offered anywhere. The time is limited; the number to be distributed is limited. It's an act-quick offer—good only until **APRIL 1st.**

A Separator You Know About—at a Price You Never Expected

Think of it! Have you ever seen such a liberal offer before—from a manufacturer of ANY standard, well known separator of national reputation? This offer comes from a 50-year-old manufacturer, known everywhere for reliability of product.

No "strings" at all; not the least element of chance. Every separator is sold with our **unlimited guarantee of money back** if you want it, after a fair trial. Every separator has all of our very latest improvements including the Perfected Disc Bowl—a marvel of easy cleaning, perfect skimming and easy running.

We ask nothing in return for our great Demonstration Offer price-saving except that you use the separator and tell your neighbors what you think of it. That is all we ask; we know the effect will be well worth the sacrifice we are now making.

These great "DEMONSTRATION" savings only apply on orders direct from factory—until **April 1st.** Here is just what you get, and what you save:

No. 22, 1350 lbs. or 169 gallons **Save \$42**
No. 24, 1000 lbs. or 125 gallons **Save \$28**
No. 25, 750 lbs. or 94 gallons **Save \$25**
No. 27, 500 lbs. or 63 gallons **Save \$22**

Naturally we must limit the number for distribution in each township. Be sure to send in the application coupon **TODAY** so you will be one of the fortunate ones in your community. No obligation whatever; decide after you have the complete details.

No Other Separator CAN Equal a United States because there are so many exclusive patented features that make it a labor- and money-saver every day you use it. It would take a book to tell all about these improvements; it will take only a few days for you to **DEMONSTRATE** them for yourself. You'll appreciate the one-piece frame; no corners to collect dirt. The easiest running, easiest cleaning and closest skimming bowl made. No fussing with numbered discs; they assemble quickly in any order. All gears enclosed and run in oil bath. Low crank speed, 42 to 48 turns. Equipped with speed indicator bell. Scores of other mechanical refinements that make the *United States* a labor-saver at every turn. Every *United States* sold under our **UNLIMITED GUARANTEE**

YOU are the sole judge; your money back, if you want it, after a fair trial. Send the coupon NOW—while you think of it.

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

COVER CROP

Dr. Lipman:—Could you give me some information on the following problem. I have an acre or so of land (De Kalb gravelly loam) which has been planted to peach trees for the past twelve years. These trees have now been removed and I wish to plow under a cover crop of some kind for several seasons before resetting to peaches. This land will be plowed and put into good mechanical condition in the spring. Would you advise sowing cow-peas? If so, kindly state what variety, amount and kind of commercial fertilizer, quantity of seed to acre, time of sowing, etc. I had thought of waiting until fall and seeding it to rye, but perhaps cow-peas or some other crop would be used to more advantage.—G. T. K., Maryland.

G. T. K., Maryland:—It would not be necessary to take two or three years for improving the land for the new peach orchard. It will be quite feasible to grow some crop that would return a fair profit and at the same time permit of the improvement of the land. Crops like sweet corn, tomatoes, beans or even field corn could be utilized for this purpose. It might seem desirable to seed the land down to alfalfa, to harvest the hay for two or three years and then plow the sod preparatory to planting the trees. If, for some good reason, it does not seem advisable to grow a money crop on the land while it is being improved by means of cover crops, it might be advisable to use a spring cover crop rather than wait until June or late May for the planting of cowpeas or soybeans. Crops like spring vetch or mixtures of Canada field peas and barley or oats would be satisfactory. These could be plowed under in the late summer and a fall cover crop, like crimson clover, winter vetch or alfalfa, used for plowing under in the following spring. By this method organic and nitrogen could be accumulated in the soil more quickly than by the use of cowpeas alone. It is probable that for legumes like spring vetch, cowpeas, crimson clover, winter vetch and alfalfa acid phosphate alone, used at the rate of 50 to 600 pounds per acre, would be all that is needed. This rather generous application of acid phosphate would not only give the legume cover crops a good start, but would also permit the accumulation of a reserve of phosphoric acid in the soil.

If spring vetch alone is employed, it might be used at the rate of about one bushel per acre. When used together with oats or barley three-quarters of a bushel of spring vetch and one to one and a half bushels of oats and barley should give good results. In the case of cowpeas, when broadcasted, the seed should be used at the rate of one and one-half bushels per acre. It might be well, however, to grow a mixture of cowpeas and soybeans rather than cowpeas alone. In that case, one bushel of cowpeas and one-half bushel of soybeans per acre, broadcasted, should permit the accumulation of nitrogen to good advantage. The soybeans are recommended since they are a more efficient crop for gathering nitrogen from the air than are cowpeas. On the other hand, they need inoculation where grown for the first time, whereas cowpeas seem to do fairly well on poor gravelly soil even when not provided with artificial inoculation. Among the varieties of cowpeas and soybeans that are recommended as having given in the past fairly consistent results mention may be made of Whippoorwill, Wonderful and Clay for cowpeas and Mammoth Yellow for the soybeans.

As to the time of sowing, the spring cover crops may be sown as soon as the ground is fit to work in the spring. The summer cover crops like cowpeas and soybeans, may be planted in Maryland about the middle of May or thereafter. Crimson clover, winter vetch and alfalfa may be

sown between August 20th and September 1. It should be added here that, if any of these crops could be utilized for soiling purposes or for making into hay, two crops could be readily grown in one season while the land is being enriched in organic matter and nitrogen. It might also be added that, under this intensive method of using the land, it would be desirable to use in addition to the acid phosphate recommended moderate quantities of potash, say at the rate of 50 to 60 pounds of muriate of potash per acre.

LIMING QUESTION

Lime for Soybeans

Dr. Lipman:—Will you please give me a little information on the following questions in your paper. Should soil that is sour be limed to get a good crop of soybeans? What is the best way to inoculate for them? My ground on which is truck, is sour. Lots of manure has been plowed under. Would it be harmful or of advantage, to plow early, then lime and work in well? My beets last year, had plenty of tops, but no beets. I presume that is from sour soil. How will spring liming act on beets? Where I intend putting oats would like to get that in soil. What is the best combination of grass seeds to sow with the oats?—Reader, Berks Co., Penna.

An Interested Reader, Berks County, Pa.—Soybeans will stand more acidity in the soil than clover or alfalfa. Nevertheless, this crop is distinctly benefited by applications of lime. It would appear from your statement that your land is not excessively sour. This is usually the case where large quantities of manure have been used in the past. For this reason, an application of one to one and one-half tons of ground limestone per acre, or of 1500 to 1800 pounds of hydrated lime per acre, should be sufficient. It would be best to plow the land early and to work the

to 15 pounds per acre. It may seem desirable to use equal parts of alsike and red clover rather than red clover alone. If it is intended to use the meadow for pasturage purposes rather than hay, seed of other grasses and legumes should be used. A mixture that should give good results in Berks County would consist of alfalfa—5 lbs., alsike clover—2 lbs., white clover—2 lbs., orchard grass—4 lbs., meadow fescue—4 lbs., timothy—5 lbs., and red top—2 lbs.

BARIUM PHOSPHATE

Dr. Lipman:—My fertilizer problem at this time is what is the relative value of Barium Phosphate 23 per cent phosphorus and 7 per cent Barium Sulfide, to that of 16 per cent acid phosphate. What per cent of this Barium Phosphate is soluble or available?—L. L., Clearfield Co., Penna.

L. L., Clearfield, Pa.—Since Barium Phosphate is made up of a mixture of ground phosphate rock and barium sulfide, it should be considered as a fertilizer belonging to the same group in which are included acid phosphate, basic slag, bone meal and ground phosphate rock. Barium Phosphate is guaranteed to contain 23 per cent of total phosphoric acid. It is not claimed for it that the phosphoric acid is available by the chemical method employed by the Official Agricultural Chemists. On the other hand, it is claimed for it that the presence of the barium sulfide makes Barium Phosphate superior to ordinary ground phosphate rock containing the same amount of phosphoric acid.

A number of experiments have been carried out with Barium Phosphate by the Rhode Island, Massachusetts and New Jersey Experiment Stations. In several of these the Barium Phosphate did not give any better results than did ordinary ground phosphate rock. In some of the experiments the evidence was not conclusive, since the soil on which the material was tried was well supplied with phosphoric acid. It is safe to state that Barium Phosphate, when used together with manure, will give results at least as good as those given by ground phosphate rock similarly used. In some instances it will probably give better results. Where crops like vegetables, potatoes, berries, etc., are grown, it would not be wise to depend on Barium Phosphate to furnish the phosphoric acid promptly enough to supply the maximum needs of the crop. On the other hand, in the case of meadows and orchards Barium Phosphate, if the price is not excessive, would make a fairly good showing.—J. G. Lipman.

HIGH GRADE FERTILIZERS ARE CHEAPEST

The term "high grade," as applied to a fertilizer, indicates that it contains larger amounts of nitrogen, phosphoric acid and potash, as for example, a 4-10-4 formula grade, as compared with a low grade fertilizer having a 1-6-1 formula and supplying considerably less plant food to the ton. The results of several seasons of fertilizer inspection work by the Bureau of Chemistry, Pennsylvania Department of Agriculture, clearly indicates that more plant food for the money can be had by purchasing high grade fertilizers.

A study of the retail selling prices prevailing for the brands of fertilizers received and analyzed during the spring inspection season of 1920, shows wide variations in selling prices not only for the different brands supplying large and small amounts of plant food, but for those fertilizers supplying like amounts of plant food and having identical formulas. These values show that if a purchaser demands high grade fertilizers and watches the prices charged as a rule such grades of materials can be purchased cheaper than low grade fertilizers. As an illustration of this point, among the spring brands of complete fertilizers there were 75 different formula grades. There were 33 brands having the formula 2-8-2, which supplied on the ton basis, 40 pounds of nitrogen as ammonia, 160 pounds of available phosphoric acid and 40 pounds of water soluble potash, which sold at a retail price of from \$38.47 to \$52 a ton, showing a difference of \$13.53 a ton for fertilizers supplying the same amount of plant food.

DISAPPROVES LEAGUE'S PLAN

Note—The Editor of Pennsylvania Farmer has felt that the wisest course for members of the Dairymen's League to pursue under the present conditions is to hold their organization together and pool their interests for the time being. This seems to be the only thing that can be done to defeat the enemies in their efforts to break up the producers' organization and get back to the back-door plan of individual contracts. However, we believe in giving all sides a hearing and willingly publish the following communication, altho we do not agree with the writer.—Editor.

Editor Pennsylvania Farmer:

There seems to be a great deal written urging the new contract proposed by the Dairymen's League, but there is an opposite side to the question.

Two propositions that the League accepts are fundamentally wrong. One is that the price of milk should be based on cost of production plus a reasonable profit, and the other is that they can sell their milk better by salaried managers than to companies or individuals that work for a profit. Both of these ideas are contrary to the well established principles of political economy and can not work out.

During the war and while there was a great scarcity, articles could be sold for cost of production plus a reasonable profit, but now that there is an over production the price must be regulated entirely by the supply and demand.

Two weeks ago the creamery here was stopped from selling their milk in New York city and their regular trade was lost. Consequently on Jan. 1, the plant was closed and the farmers must find other markets for their milk.

We have a contract with the League to sell our milk, but all the League has done was to tell us to do the best we could. We have tried the other creameries of the vicinity and they say that already they have a surplus of milk on which they are losing 80 cents a can by making it into cream. We have no market for our milk and must lose money on our cows and on our feed.

The price of milk has been too high for several months back and dairymen have been so profitable that farmers have gone into it too strongly, bidding up the prices of cattle and of feed until there has grown an over supply of milk. Still the League is trying to keep up the price of milk to what they call the cost of production and a reasonable profit.

Who knows what it costs to produce milk? I do not, but I do know I have been selling milk and have had a good living from it, and that other farmers are neglecting other lines of farming and going into the milk business and make a profit. The Warren formula and figures of professors to the contrary notwithstanding.

On a farm of 80 acres I keep ten cows feeding them home grown alfalfa, corn stalks, cob meal and oats. All the feed I need to buy is a little oil cake meal, cottonseed meal and wheat bran and if milk goes on down I need not buy that. Some milk producers would like the small producers to quit as they can produce milk too cheaply.

Rather it is the big producers that should quit and let the man who can produce good milk most cheaply keep at it.

The price of milk must be based on the demand and supply regardless of cost and then the producers must keep their costs down to sell their milk at a living profit.

The other mistake the League is making is the attempt to crowd out the dealers. The handling of market milk requires men of ability, and such men do not work for salaries when they can establish a business for themselves and do the same work for a profit. So I do not place much confidence in the pooling system proposed by the League. In this section of New Jersey each railroad station has its creamery, owned and operated by a different dealer. This man does the best he can for the profit that is in the business and the League will be unable to get salaried managers to do as well as an owner who is working for a profit and therefore is on the job day in and day out. In public affairs among farmers at least everybody's business is nobody's business, and it is my impression that league business will get to running the same way, unless human nature is very different from what I regard it.

The Dairymen's League is good if it continues to sell the milk for a commission as it has been doing and to protect the producer from being imposed upon by the dealers, but I believe it should co-operate with the honest dealer instead of attempting to crowd him out and monopolize the market.—J. D. Craig, Hunterdon Co., New Jersey.

BOOSTING THE POOLING PLAN

Following the change in officers and directors of the League, when George W. Slocum, of Pennsylvania, replaced R. D. Cooper as president and six new directors were chosen, all hands have been working to boost the pooling plan whereby the proceeds of all members would be pooled, regardless of the outlet thru which the milk was marketed. This renewed effort has brought in the contracts, and early in January there were 33,000 members of the League who had signed the individual contracts granting their right to the League co-operative to handle their product in this way. As a result the time is approaching when the co-operative will be in full swing, definite plans for which are now being worked out and will be put in operation as soon as 50,000 contracts are assured.

The Dairymen's League was preparing to move its offices to Utica, N. Y., and hoped to be in its new home by February 1. A sales office is maintained in New York city at the old address where the selling force can keep in direct touch with the dealers and the open market. A representative also continues in New York to present the good work of the League to city consumers and so encourage good will between the League and the consuming public.

In early January, the large milk distributors claimed a surplus of fluid milk on the eastern markets, stating that consumers had cut down on their purchases and that milk had been re-

CRABINE TRIPLE WALL SILOS

Giants in Strength

When you build a new silo or rebuild your old one, make it a Crabine. The strongest as well as the handsomest silo made. Its triple-wall construction gives perfect silage protection. Outside the wall of upright staves is an air-tight, water-proof, frost-proof inner wall of Silaflex. Outside of both is the spiral Crabine covering, of giant strength—no hoops, no lugs, no weak spots, no repairs, but permanent protection for every inch of wall.

By rebuilding your old stave silo into a Crabine, you save half the cost of a new silo. Ask us to tell you how. Literature and terms on request. Write also for agency proposition.

Green Mountain SILOS

STABILITY COUNTS

Your Green Mountain Silo, with the popular hip roof, will never need an apology. It is built to stand up permanently—just as any other farm building is expected to do. Every groove and joint is made to fit tight—both for permanence and silage protection. Every stave is treated in creosote preservative. Hoops are of extra heavy steel with rolled (not cut) threads. They cost us more but they stand unusual strains. Doors fit like a safe—always tight. Wooden ladder runs; no iron to frost the fingers. Green Mountain Anchorage system holds silo absolutely firm and upright.

A beautiful silo—with nut-brown side walls and bright red cedar roof. Write today for detailed circulars. Special inducements for early orders.

OXFORD, PA.

turned to them. During the last month the League has maintained a small group of assistants in the field to straighten out irregularities and to build up the League where it was weak.

The league price of \$3.18 a 100 pounds is the base price for 3 per cent milk in the new 45.5-cent freight zone from New York city, which corresponds exactly to the quotation formerly announced as for the 200-mile zone. To this should be added four cents a 100 pounds for each additional one-tenth per cent increase in fat. The price of market milk delivered at Philadelphia, under arrangements with the Interstate Milk Producers' Association, continues at 8 cents a quart or \$3.68 a 100 pounds for 4 per cent milk which is the same price as in December. The association comprises about 11,000 producers in the Philadelphia district. At Pittsburgh the farmers get \$2.90 a 100 pounds for 3.5 per cent milk in January, which is a lower figure than in the previous month. Many other eastern markets suffered slight reductions, as normal for this season of the year, while Syracuse, Rochester and Albany were unchanged when sales were conducted on the Dairymen's League basis.—H. T. B.

PROBLEMS BEFORE MILK MEN

The market milk situation in the area covered by the Dairymen's League and in fact over the eastern territory showed little improvement in January. However, prices have held up fairly well in eastern markets where the farmers' organizations are strong, and the Dairymen's League price of \$3.18 per 100 pounds continued as in December.

Dealers who held large supplies of manufactured products are reported to be gradually diminishing their holdings, and with much of the new milk going into butter and cheese the situation appears brighter than for some months. The co-operative plants now owned by the League have been running to capacity, some taking only cream and some taking whole milk. The manufactured products are sold upon the open market by the co-operative association just as soon as they are made. In certain territories farmers at a distance from league plants have had to make the best of facilities at hand and in some cases have suffered heavily.

More butter and cheese than ever before has been turned out by the farmers themselves. One good effect of this has been that also consumption has decreased rapidly in certain districts where reliable figures had shown that considerable substitute was used. The present situation has made skim milk about the cheapest live stock feed on the market. At some points the skim milk has a nominal value of only 10 cents a 100 pounds or a little more than a fifth of a cent per quart.—H. T. B.

10,000 A. R. GUERNSEY RECORDS

On Dec. 15, 1920, the number of advanced register records completed by Guernsey cows exceeded the 10,000 mark. A total of 10,033 records had been completed by 8469 cows. Six cows had completed five records each; 26 had completed four records, 196 had completed three records, and 564 had completed two records. The average production of all records completed by Guernseys of all ages was 9068.27 pounds of milk and 434.06 pounds of butter fat, with an average test of 5.005 per cent. Of the total number of records, 37.6 per cent were completed by cows two years of age.

The Ideal Plow for Stony, Hilly Land

IT is hard to do a good job of plowing on hilly, stony land with the average plow. But here is a plow that will do your plowing the way you want it done. The John Deere Syracuse Two-Way Plow is built to meet just such plowing difficulties as yours.

JOHN DEERE SYRACUSE TWO-WAY PLOW

BUILT IN THE EAST FOR THE EAST

This plow is equipped with one right and one left-hand bottom. Each bottom may be used alternately, and the plow operated back and forth across the field, throwing the soil all one way. This feature has a special advantage in plowing hillsides. It is also an advantage in plowing irregular shaped fields where it is impossible to lay out a rectangular land. Foot levers make it possible to maintain a full width

furrow on hillsides or in plowing around stones or other obstructions. The Syracuse Two-Way Plow leaves no dead furrows or back ridges. It finishes the work as it goes. You can immediately follow the plow with your harrowing and planting operations. And it does the kind of plowing job that you and your neighbors like to see—on hillsides, on level land, and in fields of irregular shape.

Before you start spring work, go to your John Deere dealer and inspect the Syracuse Two-Way Plow. Write us for a folder describing it. Address John Deere, Moline, Illinois, and ask for Package ST 736

HORTICULTURE

Pa. Fruit Men Will Soon Supply Local Markets

PENNSYLVANIA is rapidly gaining in the production of apples for its own markets, said Prof. S. W. Fletcher, horticulturist for the Pennsylvania State College of Agriculture, before the sixty-sixth annual meeting of the New York State Horticultural Society at Rochester, N. Y., January 12 to 14. Until recent years the Keystone state was an excellent market for New York apples, but due to recent development of commercial orchards especially in the southeastern counties of the state will grow enough apples for the local markets within the next 15 years. Reviewing the growth of horticultural interests, he pointed out that only half of the commercial orchards in the state are now bearing.

Prof. Fletcher also said that the automobile and the auto truck were the chief means of carrying Pennsylvania apples to market, since in most cases the large industrial counties consume nearly all the fruit and still have to purchase from a distance. Only 10 per cent of the apples grown are sold thru commission merchants, nearly all being marketed by direct sales to the dealers or retail trade. With reference to the growth of commercial fruit growing in the southeastern counties, Prof. Fletcher said that the growers of this section must come to co-operation and standardization of their product to compete in the open markets when their orchards come into full bearing. The co-operative central packing house development in New York state, he indicated, was an example which the Pennsylvania fruit men must follow before many years have passed.

Countess Prue, 43785; 18,627 Milk, 1103.28 Butterfat

Commenting further upon the need of standardization of market fruit packs, Prof. Fletcher expressed his approval of the federal apple grading and branding law, a measure so flexible, however, that each state would have some freedom in adapting its provisions to the needs of that particular state, especially with reference to such qualities as color. The many fruit men who have been practicing the sod-mulch system in their orchards for years were interested in his comments on sod orchards. It seems that more than 50 per cent of Pennsylvania's commercial orchards

are in sod, while 96 per cent of the farm orchards are likewise in grass. In fact the sod system has grown in favor in recent seasons, perhaps due to lack of labor. Prof. Fletcher freely admits that he is a convert to the sod method on heavy orchard land. Of course there are many exceptions to the practice in Pennsylvania, but on sod he believes that it surely pays to fertilize the orchard. Where no manure is available he suggests a fertilizer analyzing 1 per cent nitrogen, 10 per cent phosphoric acid, applied at the rate of 300 to 500 pounds per acre on mature trees. Recent studies in Pennsylvania indicate that very heavy dormant pruning dwarfs rather than stimulates apple trees. He commented favorably on the diversification of crops as practiced on the large western New York fruit farms, and

believes that such methods might be followed to a greater extent in Pennsylvania. Orchard Fertilizing Problem
Reviewing a series of five orchard fertilizing experiments over a period of 20 years, Prof. U. P. Hedrick, horticulturist for the experiment station at Geneva, N. Y., and noted authority on orchard fertility, said that orchards in western New York which were well drained, well tilled and well supplied with humus from cover crops did not respond to a generous treatment of fertilizer. It must be remembered that these experiments were conducted under conditions most favorable for orchard growth and do not apply to sod orchards or orchards on rough, stony or sandy land, which may naturally be weak in plant food elements. It is possible and probable that there are many exceptions, Prof. Hedrick said. Continuing, he pointed out that orchards on poor, sandy, gravelly soils, all sodded orchards, those on soils so shallow, hard or stony that the root-run in restricted, those on soils too wet or too dry for the proper sustenance of soil bacteria, all may need fertilizer. Orchards that have not had generous treatment in tillage and cover crops, may be benefited by fertilizer. No doubt many apple orchards in New York will respond to applications of one of the elements

fertility. Some may require two of the elements. A few, indeed, may respond to a complete fertilizer. After attending to drainage, tillage, spraying and the less expensive items of care the grower should obtain positive evidence as to what food elements his trees need. To secure such evidence he must observe and experiment in his own orchard.

New York President Reports Loss

The average fruit grower this season did not cover expenses on his apples, said H. E. Wellman, of Kenilworth, N. Y., retiring president of the New York State Horticultural Society, as he discussed the experience of New York growers with the 1920 crop. According to exact figures gathered by county agents and other official representatives this year, it cost \$3.70 a barrel to produce apples in western New York, and \$4 a barrel in the Hudson valley. At the same time the average net price to New York growers was around \$3 a barrel, a loss of 75 cents to \$1 in many cases. Mr. Wellman believes the fruit men should join with all other farm organizations to fight daylight saving, and in various states it will take the earnest work of all farm interests.

The New York fruit growers in their annual business session approved of the economy program of Governor Miller of New York, a retraining program in the administration of state funds which has received so much discussion among farm organizations in various states. The New York horticulturists believe in a return to the peace-time and the reconstruction of business methods so that fruit men and farmers will be in a position to sell their products at figures that cover the cost of production. Hunters have given so much trouble in New York state in trespass and destruction of life and property that the fruit men have joined with other farm organizations in demanding a law which requires a hunter or fisherman to get written permission.

Officers of the New York society for the coming year are: President, T. E. Cross, of La Grangeville, N. Y.; first vice president, J. B. Pease, of Gasport, N. Y.; second vice-president, F. W. Cornwell, of Pultneyville, N. Y.; third vice-president, B. G. Wilson, of Watertown, N. Y.; fourth vice-president, B. J. Case, of Solus, N. Y.; secretary-treasurer, Roy P. McPherson, of LeRoy, N. Y. The executive committee is composed of W. Ten Broeck, of Hudson, N. Y.; G. W. Dunn, of Webster, N. Y.; W. R. Clarke, of Milton, N. Y.; Theodore J. Smith, of Geneva, N. Y., and C. S. Wilson, former New York state commissioner of agriculture. The annual membership fee of the society was raised from \$2 to \$3 a year. H. T. R., New York.

COUNTRESS PRUE 43785 WORLD'S CHAMPION

A new world's champion record of production for the Guernsey breed has been completed by Countess Prue 43785, owned by F. L. Howes of Riverdale Farm, Groton, Mass. On Nov. 29, she completed her year's work of 18,627.9 pounds of milk and 1103.28 pounds of butterfat. Five other Guernsey cows have produced more than 1000 pounds of butterfat, but Countess Prue 43785 is the first Guernsey cow to exceed 1100 pounds of butterfat. This accomplishment brings much fame to Riverdale Farm, to the owner of the cow, and to her caretakers, Harry R. Robblee, manager, and W. C. Burdick, herdsman.

SUPERIOR-The Right Grain Drill For You

HERE is a grain drill that never skips, or clogs, or bunches; leaves no spots of bare unseeded soil or other spots over-seeded. A drill that seeds evenly and at an even depth all the time. Buying a Superior Grain Drill is the best long-life implement investment you can make. Built for good work and long, hard service. Light of draft and easy on team.

For Team or Any Tractor

SUPERIOR Grain Drills insure the utmost yield from every foot of ground. For heavy or light soils—for work on hill-side or level ground Superior gives the most uniform distribution, the greatest economy of time, labor and seed, and you are assured a perfect stand of grain at harvest time.

SUPERIOR Tractor Drills have an adjustable hitch for use with any tractor and a special power lift that enables the operator to raise or lower the discs while in motion without leaving seat of tractor. Your dealer will be glad to show you the many special features. It is the right grain drill for your farm.

A Beechwood needs no coaxing!

You're no longer slave to the whims of a range when you own a Beechwood. The extra large fire box holds a banked fire longer without attention. The Duplex Grate in one turn rakes the fire and puts it in shape for immediate cooking without coaxing or delay.

You're through with blacking. A cloth will make the polished top and enameled sides bright and spotless. Three colors, blue, brown, and gray.

Write for illustrated booklet giving details.

The Quakertown Stove Works, Quakertown, Pa.

Beechwood
Heaters and Ranges

IT'S ALL IN YOUR POINT OF VIEW

"What in the world can Mary Adeline want with Ben Stillman? She's such an attractive girl, full of pep and charm. Always on the alert; in fact, the most entertaining girl I know of. And by far the prettiest!"

"You're right, Bertie, she's the most all-round girl in the city. And Ben! Well, Ben's absolutely impossible. He's simply lost when he's out with Mary Adeline's crowd. He seems quite tongue-tied. He can't and won't, they say, dance a step. He doesn't know a brassie from a mid-iron. And I don't suppose he ever held a tennis racket in his hand. He's a real bore. That's what I think."

"Yes, but did you know," quietly interrupted an unobtrusive little friend of Mary Adeline, who was both little and loyal, "that Ben graduated with first honors from his University? That he was on the debating team and the College Glee Club? That he was the captain of his football team? Also, my dears, he worked every step of his way thru college and saw that the little mother at home had all the comforts and a few of the luxuries besides. Mary says he'll be a United States Senator before he's thirty-five. You see, friends, it's all in your point of view."

N. B. Sure enough, Mary's prediction came right.

"There goes that stuffy-minded guest of Emily's. Bouncing around with a new man at her satin heels every hour of the day. Seems to never feel a care or responsibility in the world. And, I've heard she's as poor as a church mouse."

"Why, I wonder," chirped Mrs. Greenback, "isn't she out earning her 'board 'n keep'? I should think she'd not care to be dependent on her moneyed relatives. I never saw a more irresponsible creature in my life! It's disgusting; this day and age!"

But the conversation was changed for The Irresponsible Creature joined the little gossamer clique.

After a few moments tears welled up in her eyes, and—

"Do you know whenever, I see you sweet motherly women sitting around sewing like this, it makes my heart almost stop beating. I once had just such a lovely mother. And she always seemed to have a little mending in her sweet hands. For fifteen years Muzzy was an invalid. I was her nurse all that time. 'Little Pal,' she used to call me. Six months ago Muzzy went away. This little vacation is the first taste of real girlhood I have ever had. But, do you know? The strange part of it all is I wouldn't trade an hour of waiting on Muzzy for six years of this kind of life."

Oh, there's so often a chapter to his or her life's book of which we know nothing at all! We do not see into all the rooms of our friend's homes; neither do we see into all the corners and crevices of their hearts."—Helen Gregg Green.

HOUSEHOLD YARNS

Thrift is the careful use of money and materials.

Does the bowl of breakfast cereal get its share of attention in the children's daily meals?

Sound housing, some wise man has said, should be the aspiration of a man for his family, and of a nation for its people.

Cornmeal is a good food because it is a cheap source of energy. Mush and milk finds its way to the modern table much too seldom.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

2688.—Patterns for Cap, Baby Boots, Mittens, and Refooting Stockings

An old waist, or set of sleeves, of velvet, silk, serge, cloth, plus or fur will make this jaunty "Tam." Your old felt hat may be ripped, washed and used to make this pair of shoes for baby. You need not throw away small pieces of fur, plush, velvet or your old long kid gloves—even old woolen stockings and sweater sleeves, old worsted scarfs and caps may be used to make warm mittens by this pattern. For resoling and footing stockings, save all your castoff knitted things, your merino and wool underwear, sleeves of an old sweater or a soft shirt to make a pair of socks or stockings by this stocking pattern.

The pattern is cut in 3 sets for ladies', misses and children. The ladies' size requires for cap, 1 1/2 yards of 20-inch material; for pair of stockings, 1 yard of 36-inch material; for 1 pair of mittens, 3/4 yard of 30-inch material. The shoe pattern is cut in only one size (infants), and requires 1/4 yard of 20-inch material. Pattern, 10 cents.

1303.—Pattern for Refooting Stockings

The usefulness of this pattern will be apparent at once to the economical woman, as the soles of stockings wear out long before the leg portion. This pattern gives two different soles, both equally good and shaped so that the seams will not cause any discomfort to the wearer, as darned stockings sometimes do. Expensive silk stockings may be made to do duty twice as long when refooted in this way. The upper part of an old stock will cut the soles for a pair. The pattern is cut in three sizes: 8, 9 and 10 inches. Pattern costs ten cents.

3420.—Accessories For Suit or Gown
The pattern is cut in 3 sizes: small, medium and large. No. 2 will require 7/8 yard. No. 3 will require 1 yard. No. 1 will require 3/4 yard for collar, and 5/8 yard for a pair of cuffs. Velvet, silk, mull, lawn and linen are good for these models. Pattern costs 10 cents.

3488.—One of the Popular Tie-back Blouses
The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38-inch size will require 2 3/4 yards of 44-inch material. Embroidered serge, georgette, tricotee, satin, crepe, crepe de chine, linen, voile and batiste are attractive goods for this model. Pattern costs 10 cents.

It is a wise woman who saves the water from cooked rice, macaroni or vegetables and uses it in soups or sauces, thereby adding to the nourishment of her family and to the fullness of her purse.

New York City

40,000 Bargains

Back again to the old prices! Here in New York, the center of the commercial world, the readjustment of prices has been practically completed. It is unnecessary to wait a day longer to buy those things you have wanted so long. We are close to normal values at last! And find new merchandise of every description is now available at prices far below those you are used to paying.

Look Through Our New Catalog

No better indication can be found than the price ranges in our new Big Catalog,—"Your Bargain Book." You will be amazed at the wonderful new values represented in its pages. Men's

women's and children's clothes, furnishings and shoes; furniture, carpets and draperies;—sporting goods and toys;—silverware, novelties and china;—tools, hardware and auto accessories;—farm machinery and harness;—in every department better quality at lower costs.

Fresh New Stocks —At Prices Here to Stay

Our stock are fresh and new—new merchandise at the old prices. And you are offered first choice of the markets of the world. We have made amply ready for this new business at old prices and can give you splendid service from every store. Your first order will prove this.

TALKS WITH THE BOYS

THE EDITOR'S LETTER

To the Boys:

I have had a lot of interesting letters from the boys during the past week. Of course, it is not expected that we shall publish all of them, but they are all welcome and help to tell me about what will interest and help you. So, send them along.

A boy living in the central part of Pennsylvania writes a good letter containing the following:

"My father is one of the old-fashioned kind. He is the best father in this country, or at least the best I ever heard of. But he does not believe that he should feed certain kinds of feed to cattle to get best results. I go to school and like the study of agriculture best as it tells how to farm. I would like to get father interested in the dairy business if I can. Please answer this letter and tell me how to do it."

That boy has the right kind of stuff in him and will make a good farmer providing his father is wise and gives him the right encouragement. Anyway, let the boy go ahead with his studies and the time will come when he can put to use what he learns. There are a great many fathers, unfortunately, who do not believe in adopting better methods. They call them "new-fangled" ideas and think that because grandfather fed nothing to cows but hay, corn fodder and "chop," that that is all that is needed. I hope this boy will be able to convince his father that there may be some things which he does not know. I would like to have a plain, straight talk with him, but of course, I will not give the boy away.

Here is a Maryland boy who is surely in earnest and who is fortunate in having a live school to go to. If all rural teachers had the "pep" that is shown here rural schools would do more for rural children than they do:

"At our school we have club meetings at which time the boys of the club talk on dairying, trucking, mowing, etc. The girls talk on domestic science. At our next meeting we are going to have a debate—Resolved that to future farmers of Urconico County dairying is more promising than trucking. I am on the affirmative side. The debate is to be Jan. 26th. I would very much appreciate it if you would send me a few points on the affirmative side and write a little about each point so I can select from them."

"My father is a pleased subscriber of your paper and we all give it much praise as a farm, dairy, truck, home and poultry paper."—Alonzo Dyles, Jr., Maryland.

A young man of 18 years of age writes that he would like to take an agricultural course at State College, but as he has had to work a great deal on the farm and the home school was never very good he does not have sufficient education to be admitted to college.

This is only too true of most rural communities. The schools have not been of a kind that would fit country children for any kind of college. However, if the young man wants an education hard enough and if there is a high school within reach at all, he is not too old to catch up, providing he will get down and dig. If this is not possible, it is possible to get a good practical education by reading and study at home. Write to the Correspondence Department Agricultural College, State College, Pa., and get information of home

courses by mail. These will help wonderfully.

*Sincerely,
The Editor*

LIKES THE DEPARTMENT

Dear Editor:—I have been reading your challenges to the boys in Pennsylvania Farmer, which were very interesting to me.

I am nine years old and am living on the farm and therefore your editorial about the birds was very interesting to me. I can watch them closely on the fruit-trees, seeing how they pick the insects off the bark. I also will follow your suggestion about helping to feed the birds thru the winter.

Regarding the school work, I can tell you that I am getting along first rate and am now in the fifth grade with the promise of my teacher to be promoted by the end of the term. Hoping you will write more, I am, sincerely yours, Ernest Ruark, Bucks Co., Pa.

CLEAN POCKETS

Two boys went to ask for work. They took letters and cards from parents and teachers to show to the man who had advertised for boys.

The man said he did not care to look at the letters, but asked each boy to take off his coat and place it on the counter.

Then, to the surprise of the boys, the man turned and began to examine the pockets of the coats, taking pains to skip none.

In the pockets of one coat he found a pack of cards, some cigarette pictures, some rice paper and some bits of tobacco; also an empty purse.

In the pockets of the other coat he found a pencil, a note book, a watch giving the correct time, and a pocketbook containing a little money.

To the owner of this coat the man said: "I have hired boys and men for twenty years, and have seldom had trouble with one who could pass what I call the pocket test. You have passed it successfully. Come in tomorrow morning and begin work."

To the owner of the other coat he said "Good day."

TWO ROADS

In winter time it's straight and hard,
The road to Knowledge Land;
By Study Lane and Schoolbook Place,
With pencil in your hand.

Your eyes must see, your ears must hear

The things there are to learn;
And never to the right or left
Your little feet must turn.

But when the summer comes, oh, then
You'll find that Greenfield Way,
And Woodsy Path, and Sunset Hill
Will lead you day by day.

If you will look and listen well
And read on every hand
The open books Dame Nature leads
To that same Knowledge Land.

He serves all who dares be true.

The Voice of the Pack

by Edison Marshall

SYNOPSIS

Dan Failing had just received from his physician the unwelcome information that he had but six months to live. Altho descended from a long line of hardy pioneers, his life had been spent in the city where confinement in an office had destroyed the physical foundation which his forefathers had laid. He crawled out to the city park, seated himself on a bench where he made the acquaintance of a squirrel. The squirrel's antics awoke a latent love and appreciation for the things of Nature and he suddenly resolved to spend his last six months in the forests of the Northwest where his grandfather had lived. He acts at once upon this resolve and he is soon in the virgin forests of that great country. He is fortunate in becoming an inmate of a home owned by a man who knew and loved Dan's grandfather. A daughter, nicknamed Snowbird, is also a member of the family.

(Continued From Last Week)
CHAPTER IV

THE long night was almost done when Whisperfoot even got sight of further game. Once a flock of grouse exploded with a roar of wings from a thicket; but they had been awakened by the first whisper of dawn in the wind, and he really had no chance at them. Soon after this, the moon set.

The larger creatures of the forest are almost as helpless in absolute darkness as human beings. It is very well to talk of seeing in the dark, but from the nature of things, even vertical pupils may only respond to light. No owl or bat can see in absolute darkness. Altho the stars still burned, and possibly a fine filament of light had spread out from the east, the descending moon left the forest much too dark for Whisperfoot to hunt with any advantage. It became increasingly likely that he would have to retire to his lair without any meal whatever.

But still he remained, hoping against hope. After a futile fifteen minutes of watching a trail, he heard a doe feeding on a hillside. Its footfall was not so heavy as the sturdy tramp of a buck, and besides, the bucks would be higher on the ridges this time of morning. He began a cautious advance toward it.

For the first fifty yards the hunt was in his favor. He came up wind, and the brush made a perfect cover. The doe unfortunately was standing a full twenty yards farther, in an open glade. For a long moment the tawny creature stood motionless, hoping that the prey would wander toward him. But even in this darkness, he could tell that she was making a half-circle that would miss him by forty yards, a course that would eventually take her down wind in almost the direction that Whisperfoot had come.

Under ordinary circumstances Whisperfoot would not have made an attack. A cougar can run swiftly, but a deer is light itself. The big cat would have preferred to linger, a motionless thing in the thickets, hoping some other member of the deer herd to which the doe must have belonged would come into his ambush. But the hunt was late, and Whisperfoot was very angry. Too

many times this night he had missed his kill. Besides, the herd was certainly somewhere down wind, and for certain very important reasons a cougar might as well hunt elephants as try to stalk down wind. The breeze carries his scent more surely than a serant carries a visiting card. In desperation he leaped from the thicket and charged the deer.

In spite of the preponderant odds against him, the charge was almost a success. He went fully half the distance between them before the deer perceived him. Then she leaped. There seemed to be no interlude of time between the instant that she beheld the dim, tawny figure in the air and that in which her long legs pushed out in a spring. But she did not leap straight ahead. She knew enough of the cougars to know that the great cat would certainly aim for her head and neck in the same way that a duck-hunter leads a fast-flying duck—hoping to intercept her leap. Even as her feet left the ground she seemed to whirl in the air, and the deadly talons whipped down in vain. Then, cutting back in front, she raced down wind.

It is usually the most unmitigated folly for a cougar to chase a deer against which he has missed his stroke; and it is also quite fatal to his dignity. And whoever doubts for a minute that the larger creatures have no dignity, and that it is not very dear to them, simply knows nothing about the ways of animals. They cling to it to the death. And nothing is quite so amusing to old Wolf, the bear—who, after all, has the best sense of humor in the forest—as the sight of a tawny, majestic mountain lion, rabid and foaming at the mouth, in an effort to chase a deer that he can't possibly catch. But tonight it was too dark for Wolf to see. Besides, one disappointment after another had crumbled, as the rains crumble leaves, the last vestige of Whisperfoot's self-control. Snarling, he bounded after the doe.

She was lost to sight at once in the darkness, but for fully thirty yards he raced in her pursuit. And it is true that deep down in his own well of instincts—those mysterious waters that the events of life can hardly trouble—he really didn't expect to overtake her. If he had stopped to think, it would have been one of the really great surprises of his life to hear the sudden, unmistakable stir and movement of a large, living creature not fifteen feet distant in the thicket.

He didn't stop to think at all. He didn't puzzle on the extreme unlikelihood of a doe halting in her flight from a cougar. It is doubtful whether, in the thickets, he had any perceptions of the creature other than its movements. He was running down wind, so it is certain that he didn't smell it. If he saw it at all, it was just as a shadow, sufficiently large to be that of a deer. It was moving, crawling as Wolf sometimes crawled, seemingly to get out of his path. And Whisperfoot leaped straight at it.

It was a perfect shot. He landed

high on its shoulders. His head lashed down, and the white teeth closed. All the long life of his race he had known that pungent essence that flowed forth. His senses perceived it, a message shot along his nerves to his brain. And then he opened his mouth in a high, far-carrying squeal of utter, abject terror.

He sprang a full fifteen feet back into the thickets; then crouched. The hair stood still at his shoulders, his claws were bared; he was prepared to fight to the death. He didn't understand. He only knew the worst single terror of his life. It was not a doe that he had attacked in the darkness. It was not Urson, the porcupine, or even Wolf. It was that imperial master of all things, man himself. Unknowingly, he had attacked Landy Hildreth, lying wounded from Cranston's bullet beside the trail. Word of the arson ring would never reach the settlements, after all.

And as for Whisperfoot—the terror that choked his heart with blood began to wear off in a little while. The man lay so still in the thickets. Besides, there was a strange, wild smell in the air. Whisperfoot's stroke had gone home so true there had not even been a fight. The darkness began to lift around him, and a strange exultation, a rapture unknown before in all his hunting, began to creep into his wild blood. Then, as a shadow steals, he went creeping back to his den.

CHAPTER V

Dan Failing had been studying nature on the high ridges; and he went home by a back trail that led to old Bald Mountain. Many a man of longer residence in the mountains would not have cared to strike off thru the thickets with no guide except his own sense of direction. The ridges are too many, and they look too much alike. It is very easy to walk in a great circle—because one leg tires before the other—with no hope whatever of anything except the spirit ever rising above the barrier of the pines. But Dan always knew exactly where he was. It was part of his inheritance from his frontiersmen ancestors, and it freed his wings in the hills.

The trail was just a narrow serpent in the brush; and it had not been made by gangs of laborers, working with shovels and picks. Possibly half a dozen white men, in all, had ever walked along it. It was just the path of the wild creatures, worn down by hoof and paw and cushion since the young days of the world.

It was covered like a sheep lane, with little slit triangles in the yellow dirt. Some of them were hardly larger than the print of a man's thumb, and they went all the way up to a great imprint that Dan could scarcely cover with his open hand. All manner of deer, from seasonal fawns with spotted coats and wide, startled eyes, to the great bull elk, monarch of the forest, had passed that way before him. Once he found the traces of an old kill, where a cougar had dined and from which the buzzards had but newly departed. And once he saw where Wolf had left his challenge in the bark of a great pine.

This is a very common thing for Wolf to do—to go about leaving challenges as if he were the most warlike creature in the world. In the trying hour he had come to realize, he never fights until he is driven to it, and then his big, furry arms turn out to be steel compressors of the first order; he is patient

and good-natured and ordinarily all he wants to do is sleep in the leaves and grunt and soliloquize and hunt berries. But woe to the man or beast who meets him in a rough-and-tumble fight. Unlike his great cousin the Grizzly, that American Adamzad that not only walks like a man but kills cattle like a butcher, he almost never eats meat. No one ever pays any attention to his challenges either, and likely he never thought any one would. They seemed to be the result of an inherited tendency with him, just as much as to grow drowsy in winter, or to scratch fleas from his furry hide.

He sees a tree that suits his fancy and immediately stands on his hind legs beside it. Then he scratches the bark, just as high up as he can reach. The idea seemed to be that if any other bear should journey along that way, should find that he couldn't reach as high, he would immediately quit the territory. But it doesn't work out in practice. Nine times out of ten there will be a dozen

WooFs in the same neighborhood, no two of equal size, yet they hunt their berries and rob their bee trees in perfect peace. Perhaps the impulse still remains, a dim, remembered instinct, long after it has outlived its usefulness—just as man, ten thousand years after his arboreal existence, will often throw his arms into the air as if to seize a tree branch when he is badly frightened.

It was a roundabout trail home, but yet it had its advantages. It took him within two miles of Snowbird's lookout station, and at this hour of day he had been particularly fortunate in finding her at a certain spring on the mountain side. It was a rather singular coincidence. Along about four he would usually find himself wandering up that way. Strange enough, at the same time, it was true that she had an irresistible impulse to go down and sit in the green ferns beside the same spring. They always seemed to be surprised to see one another. In reality, either of them would have been considerably more surprised had the other failed to put in an appearance. And always they had long talks, as the afternoon drew to twilight.

"But I don't think you ought to wait so late before starting home," the girl would always say. "You're not a human hawk, and it is easier to get lost than you think."

And this solicitude, Dan rightly figured, was a good sign. There was only one objection to it. It resulted in an unmistakable inference that she considered him unable to take care of himself—and that was the last thing on earth that he wanted her to think. He understood her well enough to know that her standards were the standards of the mountains, valuing strength and self-reliance above all things. He didn't stop to question why, every day, he trod so many weary miles to be with her.

She was as natural as a fawn; and many times she had quite taken away his breath. And once she did it literally. He didn't think that so long as death spared him he would ever be able to forget that experience. It was her birthday, and knowing of it in time he had arranged for the delivery of a certain package, dear to a girlish heart, at her father's house.

In the trying hour he had come to realize, he never fights until he is driven to it, and then his big, furry arms turn out to be steel compressors of the first order; he is patient

and good-natured and ordinarily all he wants to do is sleep in the leaves and grunt and soliloquize and hunt berries. But woe to the man or beast who meets him in a rough-and-tumble fight. Unlike his great cousin the Grizzly, that American Adamzad that not only walks like a man but kills cattle like a butcher, he almost never eats meat. No one ever pays any attention to his challenges either, and likely he never thought any one would. They seemed to be the result of an inherited tendency with him, just as much as to grow drowsy in winter, or to scratch fleas from his furry hide.

A Story for Children

The Bunnies' Surprise Party

red, as she took off its wrapping paper. It was a jolly old gift, he recollected. And when she had seen it, she fairly leaped at him. Her warm, round arms around his neck, and the softest, loveliest lips in the world pressed his. But in those days he didn't have the strength that he had now. He felt he could endure the same experience again with no embarrassment whatever. His first impression then, besides abounding, incredible astonishment, was that she had quite knocked out his breath. But let it be said for him that he recovered with notable promptness. His own arms had gone up and closed around—and the girl had wriggled free.

"But you mustn't do that!" she told him.

"But, good Lord, girl! You did it to me! Is there no justice in women?"

"But I did it to thank you for this lovely gift. For remembering me—for being so good—and considerate. You haven't any cause to thank me."

He had many very serious difficulties in thinking it out. And only one conclusion was obtainable—that snowbird kissed as naturally as she did anything else, and the kiss meant exactly what she said it did and no more. But the fact remained that he would have walked a good many miles farther if he thought there was any possibility of a repeat.

But all at once his fantasies were suddenly and rudely dispelled by the intrusion of realities. Even a man in the depths of concentration cannot be inattentive to the wild sounds of the mountains. They have a commanding, a penetrating quality all their own. A mathematician cannot walk over a mountain trail pondering on the fourth dimension when some living creature is consistently cracking brush in the thickets beside him. Human nature is directly opposed to such a thing, and it is too much to expect of any man. He has too many memories of saber-tooth tigers, springing from their lairs, and likely he has heard too many bear stories in his youth.

Dan had been walking silently himself in the pine needles. As Lennox had wondered at long ago, he knew how by instinct, and instinctively he practiced this attainment as soon as he got out into the wild. The creature was fully one hundred yards distant, yet Dan could hear him with entire plainness. And for a while he couldn't even guess what manner of thing it might be.

A cougar that made so much noise would be immediately expelled from the union. A wolf pack, running by night, might crack brush as freely; but a wolf pack would also bay to wake the dead. Of course it might be an elk or a steer, and still more likely, a bear. He stood still and listened. The sound grew nearer.

Soon it became evident that the creature was either walking with two legs, or else was a four-footed animal putting two feet down at a time. Dan had learned to wait. He stood perfectly still. And gradually he came to the conclusion that he was listening to the footfall of another man.

But it was rather hard to imagine what a man might be doing on this lonely hill. Of course it might be a deer hunter; but few were the valiant sportsmen who had penetrated to this far land. The footfall was much too heavy for Snowbird. The steps were evidently on another trail that intersected his own trail one hundred yards farther up the hill. He had only to stand still, and in an instant the man would come in sight.

He took one step into the thickets, prepared to conceal himself if it became necessary. Then he waited. Soon the man stepped out on the trail.

Even at the distance of one hundred yards, Dan had no difficulty whatever in recognizing him. He could not mistake this tall, dark form, the soiled, slouchy clothes, the rough hair, the intent, dark features. It was a man about his own age, his own height, but weighing fully twenty pounds more, and the dark, narrow eyes could belong to do one but Bert Cranston. He carried his rifle loosely in his arms.

He stopped at the forks in the trail and looked carefully in all directions. Dan had every reason to think that Cranston would see him at first glance. Only one clump of thickets sheltered him. But because Dan had learned the lesson of standing still, because his olive-drab sporting clothes blended softly with the colored leaves, Cranston did not detect him. He turned and strode on down the trail.

He didn't move quite like a man with innocent purposes. There was something stealthy, something sinister in his stride, and the way he kept such a sharp lookout in all directions. Yet he never glanced to the trail for deer tracks, as he would have done had he been hunting. Without ever waiting to meditate on the matter, Dan started to shadow him.

Before one hundred yards had been traveled, he could better understand the joy the cougar takes in his hunting. It was the same process—a cautious, silent advance in the trail of prey. He had to walk with the same caution, he had to take advantage of the thickets. He began to feel a curious excitement.

Cranston seemed to be moving more carefully now, examining the brush along the trail. Now and then he glanced up at the tree tops. And all at once he stopped and knelt in the dry shrubbery.

At first all that Dan could see was the glitter of a knife blade.

Cranston seemed to be whittling a piece of dead pine into fine shavings. Now he was gathering pine needles and making a little pile of them. And then, just as Cranston drew his match, Dan saw his purpose.

Cranston was at his old trade—setting a forest fire.

(Continued Next Week.)

HIS FOND FAREWELL

A Frenchman, guest at a London hotel, had just been presented with his bill. Though he paid it without formal protest, he was most indignant at its amount.

"I wish to see ze proprietor!" he exclaimed to the clerk.

In a moment the proprietor entered.

The Frenchman was all smiles. "Ah!" he exclaimed, "I must embrace you!"

"But why should you wish to embrace me, sir?" asked the astonished hotelkeeper. "I do not understand."

"Look at zees bill."

"Yes, your receipted bill. What of it?"

"What of it? Simple zees, saire, it means zat I shall nevaire, no nevaire, see you again."

The Result

Ethel—I suppose Jack has at least acquired some polish by this time.

May—He should have. Since prohibition he's been drinking nothing but liquid veneer.—Lafayette Lyre.

THE two little Bunnies, Fisky and Snippy, were twins, and it was their birthday. They thought of that as soon as they opened their eyes in the morning. The sun-peeping in at the window told them it was a wonderful day, and the gentle breezes called them to come out and play. "Oh, Fisky," whispered Snippy, "this is our birthday. Let's celebrate all by ourselves. I know where there is the nicest garden, with radishes, lettuce and all sorts of good things to eat."

"Yes—yes, let's," agreed Fisky. "But we mustn't let Mother see what we are up to for you know she does not allow us to go into a garden alone. She said that people eat us and if they see us in their gardens, they want to catch us more than ever."

"What do we care, this is our birthday," cried Snippy. "Let's hurry." So they jumped up out of bed and dressed quickly. As they ate their breakfast, their Mother hustled around the kitchen with a happy smile on her face. Fisky and Snippy wondered why she looked so happy but they were so busy thinking of themselves that they soon forgot to watch her. As they finished eating their crisp lettuce leaves, Mother Bunny said:

"Now, children, fly around and help Mother fix up the house and then maybe something nice will happen."

The two little Bunnies wiggled their ears at each other knowingly and started to work hard, and then when their Mother had her back turned, they both ran out the door and thru the woods until they came to Farmer Wilson's garden. Silently they crept into it and looked around. There was no one in sight, so they

started to play a game of tag. Suddenly Snippy spied a patch of cabbage leaves.

"Oh, Fisky, look at those nice cabbage leaves. Let's see who can eat the most." The race started and they were so busy eating that they did not hear heavy footsteps coming along the garden path.

"Snippy, I can't eat another bite, I feel so—Sh-sh! look!"

Stealing up behind them was Farmer Wilson with a hoe in his hand. Both Bunnies started to run and they did not stop until they dropped with exhaustion on a pile of grass far from the garden. When they could start on again, lo! and behold, they found that they had run in the opposite direction from home. Wearily they started homeward, wondering what would happen when they got there for they knew they had been very naughty.

About sundown, they were trudging slowly up the path in front of their house. Mother Bunny was standing in the doorway, weeping. Lots and lots of other bunnies were playing games in the front yard.

"Oh, my poor children, where have you been?" cried the poor, worried mother as she gathered them into her arms. I've been so frightened and you've missed the lovely surprise party I had for you."

The two runaway Bunnies looked at each other and then burst into tears for both felt sick, besides being disappointed.

Mother Bunny was so glad to see them safely home that she could not scold. But Father Bunny knew what they needed, so even though it was their birthday, he whipped them soundly, and put them to bed. Never again did they risk running away, especially on anyone's birthday.—L. M. K.

OLD HOUSES

The gray old houses are hooded women, peering from shapely tumbled bunnets of garrets hanging away. The gray old houses dream that they are hearing voices of their children in the years gone by!

With dim glazed eyes of windows, they are staring, thinking of a father when broken was his pride; And while their brood, they wonder where are faring.

The boys that kissed and the girls that cried. What old secrets here often pry and fumble? What old ghosts hurry to and fro?—Ghosts of Desires that poke about and mumble. Of hot-headed Yoes that fretted long ago.

What Tates and what Ranceuses are driving and are dreaming About the broken hearth, within the misty glen? What stories of loving and quarreling and scheming Huddle with their memories to crowd each room?

So, hushed, they stand, like hooded women peering—

These worn out houses that always dream and sigh; And like old mothers, they brood and stare at hearing Voices that vanished in the years gone by!

VERY GOOD, EDDIE

Eddie had but half an hour in which to finish up the composition on Henry VIII, on which he was engaged. Eddie's treatment of that great man was vivid, but hardly historic. He wrote:

"Henry VIII was a King of England and the greatest widower that ever was. He was born at a place called Anne Domini and he had sixty wives. The first he ordered to be executed, but she was beheaded. He revoked the second, and the third died; and then he married Annie Bowling, the daughter of Tom Bowling. When he died he was succeeded on the throne by his Aunt Mary. Her full name was Mary Queen of Scots, or the Lay of the Last Minstrel."

Faint Heart

Doris—I thought you were going to kiss me when you puckered up your lips just now.

Jack—No—er—it was only a piece of grit in my mouth.

Doris—Then, for goodness sake, swallow it—you need some!—Edinburg Scotsman.

ROYSER'S FERTILIZERS

ARE ECONOMICAL

There is no economy in cutting expenditures which bring you in a profit. That is extravagance. Royster's Fertilizer economizes for you by making your land and your labor produce larger, finer, surer yields.

Health Training in N. Y. State

THRU some mistake, the law governing health education in the public schools of New York received the name physical training instead of health training, as our instructor in the subject gives its rightful name. Following the details of this measure, one can readily see its direct bearing on the health of the school child.

Morning inspection and report is helping to form good health habits in the younger generation—something we teachers, at least, appreciate as we see the effect it has on the personal appearance of our charges. The scope of this Health Club work is suggested to even the casual visitor in many a school this year by a large square of cardboard in a conspicuous place on the wall. Across the top of this "home-made" chart are five pictures, evidently cut from magazine advertisements. The first picture on one such chart showing a tooth brush and a package of dentifrice; the second, a hand with well-groomed finger nails; the next, a girl washing her face; the fourth a girl brushing her hair; and the last a little child in a bathtub evidently enjoying a bath. Below this interesting and suggestive series of pictures is printed "Health Chart" and a list of the pupil's names. The stars or figures following these names below each day's record on five important health practices.

For some time, thoughtful teachers have seen the need of supervising the recreation periods of their pupils. Now, physical training decrees that the teacher shall supervise the playground, and, more important than all, provides that she be taught suitable games to encourage her charges to healthful play.

Physical training further provides suggestions in regard to hot lunches for those children who would otherwise bolt a cold lunch or go hungry till night. In some places this recommendation has been worked out on a co-operative plan, the parents in turn contributing material for soups, stews and the like. In other schools of my acquaintance the children take their individual portions and heat them separately on the stove in time for dinner. Specialists in dietetics tell us that this hot food helps the digestion of the rest of the meal. I know it compels the boys and girls to eat more slowly, which is certainly another good health habit for young Americans.

In rural communities, particularly, one hears a great deal about the setting-up drills, both for and against, still the amount of so-called military training that an average child gets in four two-minute periods daily would certainly do him no harm. Of course everyone should understand that cripples and those temporarily incapacitated are excused from this exercise. It is valuable to train the child to control his body, to allow fresh air into the schoolroom (and what country schoolroom does not need some?) and to give the change of position so often needed by children who have long study periods and short recitation periods. In these respects I think the country school needs setting up drills more than the city school where proper provision is made for ventilating the room and for the self-activity of the pupils.

The physical training conferences which every rural teacher must attend for a day once in five or six weeks have been a great help to us teachers who finished our teacher-

training courses before the advent of Health Training. We have been taught some of the theory and many of the methods of presenting this work to our schools. If any teacher has tired herself out at our conferences, it was not the fault of the system or of the instructor, as our instructors have always been willing to excuse from exercise any who felt unable to take part.

Altogether, it seems to me that physical training has been and continues to be very beneficial to both teachers and pupils. I am glad to know of the possibility—and more, the probability—of a national law similar to the one now in force in New York state.—Vida M. Bates.

AGAINST CONSOLIDATION

In a recent issue of your paper, you publish an extract from one of Dr. Finegan's speeches, on consolidated schools. I wish to say I think consolidated schools alright if the law also could read that the child farthest from school should have equal privilege with the child who lives nearer. But when those farthest away must walk in all kinds of weather one and a half miles to where a rig starts, I can see nothing fair about it.

Perhaps, as Dr. Finegan remarks, we rural people are ignorant about this matter, yet as a mother of three small children, aged respectively, 7, 9 and 11 years, who are obliged to arise at 5.30 A. M. each morning, eat breakfast and be at the starting place at 7.30 in order to keep warm for the three miles which they must ride from there to the school, I wish to say I think it a great injustice.

I think this law either due to ignorance of rural conditions or lack of gray matter. My boys feel the injustice very keenly. When they must wade snow banks and nearly freeze to get where the rig starts, and the other fellow's child just walk out and climb in a warm rig, right at the door. Our school directors frankly admitted they would not want a child of theirs to do it.

Last year the rig came for the children and would this year for just a small amount more than the township is now paying.

I presume one farmer pays just as much tax, accordingly, as another, yet there is a vast difference in school accommodations. As far as I can see the farmer distant from school is going to be obliged to seek a city job, in order to have his children attend school regularly. Last year my boys were out only two days each. This year, they have been out three times as much and in all probability will be out more as the weather gets colder, as they are so small to leave home before daylight with the thermometer 30 below zero and snow two or three feet deep.—E. A. W., Tioga Co., Pa.

Research Suggested

"Is kissing really dangerous," asked the girl.
"Well, I don't know that the question has ever been settled," answered the young man. "Why not take up a little scientific research along those lines?"—Louisville Courier-Journal.

Kid—How dare you! No! I never kissed a man in my life! Kidder—Aw, don't get so stuck up about it, I never did either.—Carnegie Puppet.

COUNTY NOTE

Union County, Pa.—A few inches of snow fell on the 14th which makes a needed covering for wheat, and is making sledding. The county fair for 1921 was held on Oct. 11-14, and C. M. Renner was elected secretary to take C. Dalé Wolfe's place, after serving 26 years continuously.

The Farmers' Exchange of Mifflinburg elected a board of directors on the first of this month, and they have built a new elevator, complete in every respect, and are about ready to deal in coal, grain, feed and fertilizer on a large scale. They have a capital of \$50,000. No grain of any account has been marketed lately, as farmers are waiting for \$2 wheat, and a little better price for corn, for which there is no sale now.

The county superintendent of schools visited schools, with the directors of Buffalo township, four days last week. Hartley township used to employ 10 teachers, but there are only four open this winter, as the pupils from five schools are hauled to Laurelton where they have a consolidated school of four grades and four teachers, and there are only three ungraded schools open.

Many farm buildings were rodded in the county last summer as a protection against lightning. Poultrymen are getting ready to start their incubators to hatch chicks. Western horses are being shipped into the county already, and public farm sales will begin the middle of February.—J. N. Glover.

ITALIANS AS LANCASTER CO., PA. FARMERS

Among the farmers of Lancaster County, Pa., several nationalities are represented besides the native American, the Irishman, the German and the Italian are all here and are holding up their end very well. The writer recently came in contact with a few of the sons of Italy who have taken to the soil of Lancaster County for a livelihood and made good.

John Plastino came to Lancaster County to work for the John Shields Construction Co., while the Atglen & Susquehanna Railroad was under construction and after its completion some 15 years ago, he purchased a farm four miles east of Quarryville which he operated until three years ago when he retired, having rented his farm to a native American on the shares and is now living retired and abundantly to do so. He is frequently seen on the streets of Quarryville in his automobile, yet not infrequently you may find him behind a well-tied steed. He was an all-around farmer but seemed to be especially successful in growing cabbage and tobacco and has hauled more tons of cabbage per acre to Quarryville for shipment than any farmer in his locality, and delivered at Quarryville some of the best tobacco as to quality and weight per acre grown in this section.

Alexander Distifano came to Lancaster city about thirty years ago. Six years ago he purchased a farm near Hollywood and has lived thereon ever since. His neighbors say the first thing he did was to clean it up and has kept it clean ever since. Everything about the place shows evidence of good care and in the garage you will find a big touring car, and in the parlor a costly player-piano.

These men are good citizens and Alex. Distifano furnished Uncle Sam with a loyal soldier boy who saw service in France.—J. B. M., Quarryville, Lane Co., Pa.

Make Dreams Come True

JAMES PLANS MAKE A BARN ALL THAT A BARN SHOULD BE

What better time than now, to plan the barn that some day will be yours?

Even though you may not be certain that you will build during this coming season, you should plan now, so that when the time does come, you can go right ahead without delay and without fear of mistakes.

Build on Paper First

Plan now that you may have plenty of time to study it over and make it an ideal barn.

Be sure you have the right amount of storage, enough light, air space and ventilation; work-saving arrangement for feeding, watering stock and cleaning the stable; easy handling of hay; right location of barn for sunshine and cold winds.

Make certain that the barn is correctly proportioned, individual in appearance, a barn that is strong and that will withstand all storms—one that will add value to your farm.

You can have all this without extra cost.

You Save by Planning

What a barn costs depends in no small degree on the care with which it is planned in advance.

It is not uncommon to see one man with the "know how" build a barn at 20% to 30% less cost than another, although the two barns accommodate the same number of cows.

The man who plans well in advance is the man who builds cheaply.

By having his plans completely worked out and blue printed, he can submit them to several contractors, getting bids from each on exactly the same proposition.

Then he can safely let the contract to the lowest bidder.

Contractors and those supplying materials are held to exact requirements; substitution of inferior materials or workmanship can be prevented; wastes are avoided; no excuse is given for expensive "extras"; and misunderstandings with contractors, sub-contractors and workmen are unlikely.

Good plans insure better barns at lower cost.

James Manufacturing Company, Fort Atkinson, Wisconsin
James way
Labor Saving Equipment for the Dairy Barn

A "Clearing House" of Best Barn Ideas

James Barn Plans

To help our customers and others get the best barns possible, we established the Jamesway Barn Plan Service.

This is under the direct supervision of Mr. W. D. James, leading dairy barn authority. Architects of special experience in planning, building and remodeling dairy barns, a large force of skilled barn designers and draftsmen, and barn experts in charge of divisions of the field force, complete the office staff.

In the field are more than 60 men who practically every day are advising on re-

modeling and other barn problems, drawing preliminary plans and reporting on new ideas and unusual conditions.

For years, Mr. James and these associates have studied dairy barns—construction, lighting, ventilation, drainage, arrangement to save labor; how best to remodel old barns.

Every year they help to plan thousands of dairy barns. Every year they visit thousands of dairy barns. The best barn ideas everywhere come to their notice and are tested out.

The experience and help of these men is yours for the asking.

Jamesway Book Free

The best of their ideas are in a 320 page book on barn building, remodeling, ventilation and equipment which will be sent postpaid on request.

28 pages of blue prints, 62 of pictures of barn interiors and exteriors, many pages valuable information on barn planning, remodeling, ventilation, equipment, etc.

Write us now. Tell us what barn problems are bothering you; perhaps we can help to solve them.

Ask for Jamesway Book No. 26.

Care and Use of Farm Machinery

By F. A. WIRT

Member, Amer. Soc. Agricultural Engineers.

THOUSANDS of dollars can be saved in 1921 by the farmers, collectively, of the Pennsylvania Farmer by following the suggestions made in a series of articles beginning in this issue on "Care, Management and Use of Farm Machinery" and "A Penny Saved is a Penny Earned."

Reduced operating expense is one sure way to increase the net income from farming and with future prices of farm products uncertain any method of decreasing cost of production is of vital importance. Hardly a farmer but can make a big saving each year in the use of farm machinery by systematic planning and intelligent execution, remembering always that such ideas as "it can't be done" must be forgotten.

If the significant importance of farm machinery to present-day agriculture was thoroughly appreciated and acted upon, an immense saving in time which is money, in crops, in labor, in convenience, and in all-around effectiveness, would result. But best of all that profitable result can be had in a large measure in 1921.

The suggestions made in this series of articles are not startling nor surprising. There is no easy road to cheaper use of farm machinery. It will require intelligent application to methods reasonably easy to put into effect provided that the real importance of farm machinery is appreciated and acted upon.

To farm machinery and its use the American farmer owes his enviable reputation for greatest yield per man. As an example of conditions where farm machinery is not used reference might be made to farming in China. Despite the fact that so much credit belongs to proper using of farm machinery without which farming would be a sorry lot, indeed, much is still to be learned before reasonably effective use is made of the implements now on the market and in the hands of the users.

The writer is reminded here of a good farmer he visited about two years ago to obtain his experiences with a side delivery rake and hay loader. Many years ago when side delivery rakes and hay loaders were first really pushed in that county he bought an outfit and has been using it ever since. Today, this farmer receives a premium of \$2 to \$4 a ton above the prevailing price in that section for all of the hay he can spare. He was justly proud in showing the writer the hay he had in his barn. Bright, clean, and refreshingly green hay was seen. The nutrient of this premium hay had not been destroyed by sun-burning and lost leaves. Hay buyers who offered and paid this extra price knew a good thing when they saw it.

To the writer's surprise only one of his neighbors used the similar equipment and then only after years of persuasion. In reply to a question this farmer gave his explanation of why his neighbors did not use the same equipment.

"When I bought my side delivery rake and hay loader years ago several of my neighbors did likewise and then almost immediately they gave up using this valuable equipment because it worked too hard the men on the hay rack. Now when we are loading in the field if the hay is too heavy and threatens to cover up the man on the rack we will stop and clear away the accumulation and then drive on. They really put up their hay the harder way, have a poorer quality and get less for it. I wouldn't do without a side delivery rake and loader for double the cost."

For considerations less reasonable than the above many machines have a bad reputation in certain sections. Perhaps one or two machines some years ago or only recently failed to work as the purchaser expected and as a result the machines have a bad reputation when, perhaps, the trouble was only a wrong adjustment, improper use, or unreasonable expectation.

Last spring the writer visited a farmer in a hilly and stony section and to his amazement saw a two-row cultivator at work in the corn field. In that section two-row cultivators are scarce, very scarce.

A look at the work done was enough to con-

vince the most skeptical that excellent work is possible with a 2-row cultivator even in rolling and stony fields if the planting is done with a corn planter and the same rows followed in cultivating.

"Yes," said this farmer, "my neighbors laughed at me for buying a two-row cultivator. They still use walking cultivators to quite an extent and considered a 2-row cultivator out of the question but I wouldn't do without it as we can cultivate just as well and can cover from 15 to 18 acres a day."

Just last week the writer learned of a farmer who a few years ago bought a new grain binder every two or three years yet he cut not over 40 acres a year. Such use of farm machinery is expensive and entirely unnecessary but it only goes to prove that much can be done to obtain really effective and efficient use of farm machinery.

Proper care, management and use of farm machinery will reduce the cost of using farm implements.

THE CAUSE OF POTATO BLIGHT AND DRY ROT

Potato blight and its accompanying dry rot is a disease that has long been known to potato growers for its destructiveness both in the field and in storage. The great famine in Ireland in

A Side Delivery Rake Makes Hay Loading Easier

1845 was largely due to the failure of the potato crop caused by late blight, but still many farmers of Eastern Pennsylvania, New Jersey and Delaware are discussing the cause of dry rot in this year's fall crop, as if the disease is a new one to this region, little knowing the true nature of the trouble.

Dry rot does not spring up over night like a plague, but has its beginning in the early spring. When the farmer selects his tubers for planting, a slightly affected tuber may be overlooked and in this way the disease is carried over from the fall to the spring crop, for as soon as the seed piece begins to sprout the diseased threads or mycelium keep pace with the growth of the sprout, and the disease finally makes its appearance on the leaves as definite spots, which are all together different from other potato troubles. The spots usually appear at the edges or tips of the leaves, spreading under favorable weather conditions, until the whole leaf is diseased. The leaf then becomes dark and appears to be damp and water soaked, with often a mouldy growth covering its surface. It is from this mouldy growth that the disease germs arise in great numbers, inoculating leaf after leaf until the whole field may be affected in a very short time. The germs also fall upon the ground, penetrate the soil until they reach the tender skins of the new tubers, and as a result dry rot sets in.

Dry rot is not only a field disease, but may become a severe storage disease as well. The moist atmosphere of a storage cellar favors the growth of the fungus organism and soon an inconspicuous spot begins to increase in size until the whole surface of the tuber is diseased by de-

structive soft rots which cause complete decay. Fortunately, the disease can be controlled by planting carefully selected seed stock from fields which do not show leaf blight or tuber infection, and by spraying with a good copper fungicide.

Spraying is practiced for plant protection and should, in order to be effective, start long before any infection appears on the leaves. In other words, start when the plants are five or six inches high and keep up the application every ten days for the next eight weeks. Two types of a spray material may be used, either 4-4-50 Bordeaux mixture or a good commercial spray. Home made Bordeaux has the advantage of being slightly cheaper, but very often is poorly mixed when made by persons not familiar with the process.

Commercial copper sprays on the other hand are slightly higher in cost, but have the value of being practically constant in strength and are great time-savers, especially when only small areas are to be sprayed. No matter what the fungicide, spraying will not be a success unless carefully done and put on with a pressure equalling at least 100 lbs.—J. M. LeCato, Delaware.

GOOD LOCATION A GOOD INVESTMENT

A shrewd business farmer, who bought a farm near a flourishing town at what seemed an exorbitant price, against the wishes of his relatives who pointed out that a much better piece of land back off the road could be had for less money, proved the wisdom of his investment even to the most skeptical in a few years. "The location has been worth the fifty dollars more per acre that I paid for it," he said many times. "I have gotten that back and more besides, and I have now a more salable piece of property than if I had bought on the mud road and had better crops on that land."

First of all he counted that his children and his family had received a direct money benefit from close proximity to town that meant much to any farmer. While other parents were boarding their sons and daughters in town, or letting them do light housekeeping, his children were walking to high school in good weather and going in the auto over the good road when it was stormy. The cost of keeping two children in light housekeeping rooms, and with no supervision, he found was fifteen dollars per month while boarding was four times that amount. They were able to take in educational entertainments as well as those who boarded in town, attend church services on Sunday and have a share in the high school fun as well as in the studies at small cost.

The fertilizer hauled from town the first year he owned the farm was worth to him two hundred dollars so he added that to the profit of the location. Getting his cream to market without paying for having it hauled was another item, and being able to haul twice as much on the fine roadbed as on the dirt road still another financial consideration. A home market for surplus fruits and vegetables brought in fancy prices for all the produce that could be spared for automobilists bought eagerly the good things off the farm.

But more than all his family was contented and the bustle and life of the highway satisfied demand of the boys and girls for "something doing" day by day. The boys and girls established a wayside market and made their own pocket money, while the mistress of the house found that with a chicken tight fence all the complaints of reckless drivers killing off young chickens were groundless. When the work was ended it was possible to sit on the porch and see things whereas a farm on a back road is deadly dull in leisure hours.

While, of course, location will not raise crops and redeem poor clay soil, still it means more than the average farmer who has had little experience realizes. Forty or fifty dollars more per acre for land in a good location may look expensive but pays in a way of its own.—H. Richmond.

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

THE FERTILIZER SITUATION

THE effect of the general decline in the prices of commodities is now being felt strongly in the fertilizer trade. The raw materials that enter into the manufacture of mixed fertilizers, such as acid phosphate, sulfate of ammonia, nitrate of soda, tankage, fish, cottonseed meal and potash salts, are all much cheaper now than they were last spring. This fact is recognized by the farmers and they are expecting that they should have the advantage of buying fertilizer for much less money than they paid for it last year. They argue that the crops of 1920 were made with high-priced labor, high-priced seed, high-priced fertilizer and high-priced farm machinery, but, when their crops were ready to market, they had to sell these on a declining market and often at a very serious loss to themselves. Hence, they feel that the fertilizer manufacturers should share with them these losses and should surely not expect them to pay relatively high prices for mixed goods not knowing what the prices of farm crops this year may be.

The fertilizer manufacturers, on their part, have considerable quantities of manufactured goods on hand. Some of these were made from materials bought when prices were still high, when labor was high and general expenses also high in proportion. They claim that any material reductions on goods already manufactured and on hand would cut off considerable losses to them. They are inclined to insist on the schedule of prices already adopted. There is thus a sort of deadlock between the farmers, and the manufacturers of mixed fertilizers. The farmers are refraining from buying and are quite strong in their declaration that they would rather reduce the acreage and get along with less fertilizer than buy the high-priced goods and take all the chances of growing their crops for an uncertain market. The situation is evidently a very unfortunate one, for any large reduction in the use of fertilizers would also mean a large reduction in yields and consequently smaller supplies of food for the consumers. It is evident, also, that where yields per acre are relatively low the unit cost of producing the crop is relatively high. But, after all is said and done, one need not be at all biased in expressing the opinion that the manufacturers of fertilizers are not following a far-sighted policy in insisting on schedules that are not based on replacement values. For the sake of the good-will of their customers, they should make the utmost concessions and shoulder the burden of shrinking values as has already been done by the farmers.

The fertilizer market presents today some

rather curious features. Only as recently as last spring the optimists among the importers and brokers anticipated a large demand for fertilizer materials. Crop prices were high. The cotton growers in the South, by far the largest consumers of commercial fertilizers, had not yet felt the full force of deflation. Corn, wheat, potatoes, and vegetables and fruit were still bringing war prices. At those prices the planting of large acreages and the use of generous quantities of fertilizers seemed quite proper and desirable. Since that time the agricultural situation has become a gloomy one indeed. With the disastrous decline in the value of agricultural products, the producers have had ample reason to become discouraged. The great fertilizer-consuming territory of the Cotton Belt is not making the heavy purchases of fertilizers that it has been in the habit of doing for years past. The same is true of the potato growers, fruit growers, vegetable growers, as well as the general farmers in the Middle West and along the Atlantic Seaboard. As a result of this condition, large stocks of French and German potash, of animal ammoniates, of nitrate of soda and sulfate of ammonia have accumulated. To make matters worse, the export demand for sulfate of ammonia and cottonseed meal has shrunk amazingly because of the unfavorable exchange conditions. Cottonseed meal has become so cheap as to offer again attractive values for the mixers of commercial fertilizers. Brokers are offering nitrate of soda at less than \$60 per ton, sulfate of ammonia, at less than \$70 per ton; acid phosphate for as little as \$16 per ton, and ammonia in animal tankage for as little as \$3 or \$3.25 per unit of ammonia where only a short time ago ammonia in tankage and fish was selling for as high as \$7 or \$8 per unit. Potash salts have shown a corresponding shrinkage and muriate of potash is offered by some brokers for considerably less than \$100 per ton, and kainit for \$20 a ton or less. Whether the further decline that are likely to come will be more or less striking remains to be seen. It is the belief among many well informed persons that the bottom prices have been nearly if not quite reached.

It is generally agreed that the cost of phosphoric acid in mixed fertilizers has been excessively high for the past three or four years. While it is true that both phosphate rock and sulfuric acid (used in the manufacture of acid phosphate) have greatly increased in price, it is also true that many of the manufacturers of acid phosphate have had long term contracts for both phosphate rock and sulfuric acid at relatively low prices. They have evidently made the most of their opportunities and are loath to lose the large profits made in the past few years. The situation is, however, bound to adjust itself, since there is much pressure from various directions—among them, the development in the use of newer methods for the manufacturing of available phosphates. The producers of potash in Germany and France exacted the maximum price from American consumers as long as the condition of our markets warranted it. The indications are that the developments of the next few months will tend toward a further depression in the prices

of potash materials with the result that the cost of potash will be considerably nearer than it is now to pre-war prices. Of course, no one need expect that we shall reach pre-war prices either in the case of potash salts or acid phosphate.

The producers of nitrate of soda in Chile are feeling the force of the situation as are other producers of plant-food. Recently an act was introduced for the organization of the producers of nitrate in Chile. The proposed organization would become more efficient not only in the production and shipping of nitrate of soda but also in the distribution of this fertilizer. It is proposed by the Chilean miners of nitrate to develop a selling organization that would eliminate so far as possible some of the middlemen and allow of more direct touch with the consumers. By making such economies they will be enabled, no doubt, to sell nitrate of soda at fairly reasonable prices in spite of some of the higher costs that enter into the manufacture and transportation of the material.

In the case of sulfate of ammonia, the capacity of the by-product ovens in the United States has been rapidly increasing until the output is now approximately a half million tons of sulfate of ammonia per annum. With normal exchange conditions, much of this sulfate of ammonia would be exported, particularly to Japan. With the unsettled economic conditions in Japan and the adverse exchange rates in the European countries, a large part of the sulfate of ammonia manufactured in the United States must be offered to our manufacturers of commercial fertilizers. For this reason, there has been a rapid decline in the cost of sulfate of ammonia. Last spring it sold for as high a figure as \$125 or \$130 per ton for export. The lower price of nitrate of soda and likewise the lower prices of tankage, fish and cottonseed meal have been largely responsible, especially from the decline in the export trade, for the shrinkage in the cost of sulfate of ammonia.

As one studies the situation carefully, he is led to feel that the present abnormal conditions are only temporary. It is safe to predict that in a few months the feeling among our farmers will be a more optimistic one. Their attitude toward the use of commercial fertilizers will improve. The fertilizer trade will again assume a more or less normal appearance and the tendency toward the adoption of more intensive methods, among them the use of larger quantities of fertilizer per acre, will again be emphasized as it has been since the beginning of the present century. It is to be hoped that both the fertilizer manufacturers and the farmers will have learned a lesson that will eliminate all low-grade and relatively expensive brands, will reduce their overhead costs and will make their business more efficient. Farmers should learn to co-operate, and to use plant-food more wisely as well as more generously in order that human and animal food may be produced at the lowest cost per unit.—J. G. Lipman.

The farmer has spent a good many centuries learning how to raise crops; now he is beginning to take an interest in marketing them.

VOLUME 49

NUMBER 6

OUR JOB is to serve our readers. Whenever you are puzzled, write to us and we will help you if we can.

—The Editors.

The moral and material bankruptcy of the accepted methods of statecraft helps to drive home the lesson, that only the Golden Rule of Christ can bring the Golden Age of Man.—Dr. Lawrence.

Co-Operative Associations

THE RECENT slump in the price of dairy feeds has brought us a number of letters asking why the co-operative associations charge the members more for feed than it can be bought for on the open market. To all such we would say, co-operative associations must expect to be affected by trade conditions just as are individual dealers. When prices drop after a supply is laid in, the members must bear the loss either by paying higher than market prices, or submit to assessment to pay the loss. Individuals who buy and sell commodities always face the possibility of loss thru falling prices, or of profiting if the market rises. A shrewd buyer endeavors to make one balance the other in a term of years. No kind of organization can be effected which will eliminate this element in business and farmers must learn to take their trade losses with others when they enter the commercial field.

The Farm Products Show

WHILE we expect to publish a somewhat detailed report of the State Products Show and the meetings held during the week, it is a duty to emphasize here the entire success of the show and to compliment those who engineered it. There is a lot of work about a project of this kind which the visitor may never realize as he interestedly views the exhibits or takes part in the meetings. The sincere thanks of the people of the State are due the State and institutional officials who have voluntarily given their time and efforts in addition to their regular duties to make the show a success. It is estimated that 25,000 people were in attendance during the week and the universal opinion was that it was well worth the time and expense.

State Fair Project Grows

THE DEMAND for a state fair in Pennsylvania continues to grow in force and volume. The strong recommendation for a fair made by Governor Sproul in his message to the Legislature lends additional force to the movement. The resolutions passed by the different organizations which met at Harrisburg during the State Products Show week should have a marked influence upon the law-makers. In addition to the resolution passed by the Pennsylvania State Grange shows the sentiment of that representative and influential body. As soon as a proper bill is introduced into the Legislature it

Pennsylvania Farmer

will be the duty of the citizens to urge its enactment. We shall endeavor to keep our readers fully posted upon the progress of the movement.

The Governor's Message

Governor SPROUL'S message to the Legislature of Pennsylvania is an unusually strong and suggestive public document. He has had the courage to recommend some things which other Governors have avoided and it is to be hoped that the members of the Legislature will show a like courage in carrying out. The Governor's long service as member of that body serves him well in that it enables him to know personally the currents, cross-currents and undertows which agitate the members of the legislative branch of government.

His recommendations concerning the Brook's license law may not be in accordance with what some have proposed, but his explanation that some kind of law to regulate and control saloons even for the sale of drinks containing less than one-half per cent alcohol, and that a modification of the Brook's law to conform to the requirements of the Federal law is the simplest way out, seems reasonable. The message leaves no doubt as to his wishes to complement the Federal enforcement act by proper state legislation.

Governor Sproul properly appreciates the volume and importance of the agriculture of the state and recommends such legislation as will aid in furthering its development. He called attention to the value of a state fair and urged that steps be taken towards the establishment of a fair such as our agriculture and industry warrants.

Farmers who have for years urged the placing of additional tax upon corporations and coal producers will approve the Governor's recommendations in these respects. If any additional aid is to be given to the state institutions and projects more revenue must be produced. The present income will continue present activities but will not allow any increase or improvement. Taken all in all, the message is a sane, progressive paper and should have the backing of all forward-looking people.

Grange and Farm Bureau

WE PUBLISH this week on page 26 a communication from a well known Granger in Pennsylvania on the relationship between the Grange and the Farm Bureau. We have received during the past few weeks a number of letters, pro and con, on this subject showing that there is a decided difference of opinion among members of the Grange concerning the attitude the Grange should take towards the Farm Bureau movement.

We wish to state clearly the position of Pennsylvania Farmer on this subject and we hope that position will be taken by all who have the best interests of agriculture and rural institutions at heart.

First. The work of the County Agent has, in general, proven itself to be of great value. It is the most effectual way of carrying the findings of scientific investigation to the farm. The personal contact and suggestions of a live county agent have done more to induce farmers to practice improved methods of farming in the few years of its service than was done by bulletins alone in the previous 25 years. Recent experience has shown that the reduction of costs in production is the greatest single need in all lines of effort. Better systems and better methods do not necessarily mean increased production unless an increase is needed. Their adoption does mean, however, greater profits per man and per acre. The work of the County Agent has proven itself to be the most effective means of disseminating information to this end.

The Farm Bureau is the county organization which backs and which should direct the work of the County Agent. This organization should be and in most instances it is, composed of leading, progressive farmers. The question at issue just now is: How large, how active and how ambitious should this organization be? Should it aspire to cover all subjects in which farmers are interested—social, business, education, politics, etc., or, should it confine itself to the field of

spreading the knowledge of improved methods and more economical practices? Personally, we are inclined to the latter plan, and to make it most effective we would recommend that every farmer become actively interested in the work in his county. If this kind of work can be better accomplished by federation, then federate. But it is extremely doubtful whether the conditions in our territory demand the same course as is being pursued in the western states. What is needed here is to study conditions as they exist and develop such activities as are needed. It is not necessary to copy the program of another section where the needs and conditions are radically different.

Second. The oldest, strongest and most influential farmers' organization in the East is the Grange. For more than 50 years it has served well the farmer and his family. Its principles and traditions are well established; it has played the chief part in bettering social conditions in the country and has also a respected influence in the halls of legislation; its principles lie at the base of all right action and its teachings inspire to a better manhood and a better womanhood; it fills a place in rural sociology that no purely business organization can ever attain. It has the facilities for inspiring the promotion of other and specific organizations in the community. For these and other reasons we stand firmly back of the Grange and its principles and want to see them still further extended.

With this definition of the work of each, there is no occasion for any jealousy and antagonism between these two great movements. We hope there will be none, but rather that all farmers will join in making both still more effective and more useful in promoting the best interests of farming and the rural life.

Our Washington Letter

The agricultural appropriation bill, covering the expenditures of the Department of Agriculture for the next fiscal year, is now before the House, and is receiving much attention. It carries a total of \$32,517,459, which represents an increase of \$1,875,495 over the present year's appropriation, but is \$19,511,925 less than was asked for by the department.

Of this increase \$875,495 represents the additions to the regular items, while the remainder, \$1,000,000 is for the purchase of timber lands. Live stock men asked for \$1,000,000 for bovine tuberculosis eradication work, and the committee allowed \$495,360 for this purpose. An increase of \$50,000 was allowed in the appropriation for dairy investigations. The appropriation for hog cholera eradication was increased by \$100,000 over the present year's appropriation. An increase of \$150,000 was allowed for the control of the brown tail and gypsy moths. A new item of \$100,000 was allowed for the control of the Mexican bean weevil. Two new offices are created by the bill, a director of scientific work and a director of regulatory work. The bill provides for the consolidation of the Bureau of Markets and Bureau of Crop Estimates, with an appropriation of \$2,939,440. The appropriation of \$239,000 for the annual free distribution of seeds was eliminated, but an amendment introduced by Congressman John W. Langley of Kentucky, provides for an appropriation of \$260,000 for the Congressional free seed distribution, was carried by a vote of 85 to 72. Representative McLaughlin of Michigan tried to have the amount of the appropriation reduced to \$240,000 but his amendment was lost. "I think that by continuing this appropriation for the distribution of vegetable seeds," said Representative Langley, "we assist in preventing profiteering by the seed dealers. If we discontinue the congressional distribution of seeds, as the committee proposed, it is my opinion that the private seed dealers will immediately advance their prices 20 or 25 per cent, and perhaps more, so that my amendment is intended partly to prevent profiteering at the expense of the farmers." And the House proceeded with this farce comedy without apparently sensing the ridiculousness of the situation.

Efforts are being made on the floor of the House to amend the bill, mostly for the purpose of reducing the total amount written into it by the committee, by cutting out various items. So far, however, nearly all these amendments have been defeated by a fair majority, indicating that the bill will reach the Senate in practically the same form as it came from the committee.

In the hearings, Assistant Secretary of Agriculture E. D. Ball pointed out that the Department of Agriculture has more research men in its employ than all other lines of government effort. The Department of Agriculture has 2778 scientific men; all other bureaus have 2296 men. Comparing salaries paid in the Army and Navy with those paid in the Department of Agriculture, Dr. Ball said the colonel in the Army, captain in the Navy, assistant surgeon general, hydrographic

February 5, 1921.

February 5, 1921.

or geodetic engineer, after the first five years, get \$6330. The lieutenant colonel of the Army, commander in the Navy, senior surgeon and hydrographic engineer of the same rank, after the first five years, get \$5120. The major of the Army and lieutenant commander of the Navy get \$4165. The first lieutenant of the Army gets \$3427, about the average received by leaders of the great projects of the Department of Agriculture. The average salary they are getting now is \$3431. This means that the lieutenant in the army ranks with the men handling the big work of the Department of Agriculture. The Treasury Department has 94 men here that draw salaries ranging from \$10,000 to \$12,000; the other departments of government have 371 men receiving \$5000 or more against one man in the Department of Agriculture receiving as much as \$5000, and nine men receiving \$5000. The farmers of Illinois are paying their county agents an average of \$300 more per year than is received by the project leaders in the Department of Agriculture.

Hearings on the general revision of the tariff, before the Ways and Means Committee of the House of which Representative Joseph W. Fordney of Michigan is chairman, have been in progress for some time. Three days were given to agricultural schedules. The committee is affording the producers every opportunity to state their case, with the evident desire of securing the largest possible amount of information as to the needs of the various groups of farmers for a protective tariff on their products.

Dr. T. C. Atkeson, representing the National Grange, discussed the tariff problem from the standpoint of the greatest good to the greatest number. He said industry needs to note the fact that the farmers, although buyers at the market prices of everything the protected American industries manufacture, seek no reduction in the process of these products such as would come from open competition with the world. Although numbering more than a third of the population, and being consumers of the products of American urban industries to a value at least proportionate to their numbers, they ask no free trade competition to enable them to buy cheaply. It was emphasized by Dr. Atkeson that the product of the farm is as much a finished product as that of the mill or factory; that farm crops are not raw materials, and in any tariff discussion they should be considered along with other finished manufactured products.—E. E. Reynolds.

HARRISBURG LETTER

Delays in New Legislation.—While the number of bills poured into the two branches of the Legislature is greater than known at this period of a session in a long time the absence of many measures which have been much discussed in the last year has been a disappointment to quite a few members of the general assembly who had looked for bills to be submitted promptly and a program to be a thing of black and white. As it is, the State Highway Department is the only one to have its bills in hands of the committees and they call for something like a dozen millions with some readjustments of methods of disbursements of funds when not matched by counties. The Governors' bills are either in sketches or in the hands of the Attorney General who received them only recently, while the Health Department measures, which rumor says will take something like \$8,000,000, have not showed up. Other bills are in the hands of draftsmen and the result is that it will be well in February before what was talked of in September is in hand. At the same time there is a disposition among members of the House to insist upon a date for adjournment in April being set and as the idea is favored by men in high places if not by some in Harrisburg it may work out. There is no questioning the fact that there is latent temper in the House and enough misplays were made in handling jobs to induce people to stir it up when the session gets to running strong.

What \$90,000,000 Means.—Governor Sproul's declaration in favor of a \$90,000,000 limit to appropriations was, of course, predicated upon there being no new tax legislation, and it is hard to say whether there will be any. The coal tax bill will go in and so will the manufacturing tax bill, but whether there will be much motive power remains to be seen. The Governor's statement is being interpreted here more in the nature of a warning not to bring in many salary raisers and as a curb on new jobs, while also conveying the idea that the Governor's pen is the last to work on a bill. The Governor has some ambitious plans for legislation, but is now disposed to await business developments to see how the money will come in. A decrease in revenues under the present system is anticipated, although not being noised about very much.

The Fanny Stuff.—It seems probable the Legislature will be rather rough with some of the legislation classed under the head of measures for the welfare of the race and that a disposition to be more solicitous of the health of a child of six than for jobs in pre-natal clinics will be manifested. Some indication of just what is going to happen may be gained from the fact that the bill to regulate explosives which would have

Pennsylvania Farmer

abandoned by the people behind it after "conferences." It may transpire that some of the frills which have replaced old Health Department methods may also be given up. There is a tendency among legislators to scrutinize pretty closely Public Service bills and to put the fiscal affairs of Father Penn on a more business like basis. The Departments of Agriculture and Forestry will probably have the most sympathetic ears of any on Capitol Hill because it is recognized both have been running along with a low supply of gasoline, so to speak, and are capable of meeting considerable needs if given the funds. Unfortunately the legislation to carry out their plans have not yet appeared and can not be forecast.

Forests That Will Pay.—Commissioner Gifford Pinchot is confident that State can show a return on money invested in forest lands that will be a very important addition to the school funds in a short space of years. He believes there is land now available, if the state will make the necessary appropriation, that can be made to earn handsomely against the time when the state will be casting around for revenue. The commissioner also believes the showing from lands now operated in rather indicative of what can be done.

A \$3,000,000 Jump.—The State Board of Public Charities has recommended \$19,231,000 be appropriated to state, semi-state and non-state charities. Last session \$16,544,000 was appropriated. The sum of \$1,500,000 is recommended for purely state institutions over and above what they got last session and less than \$100,000 for the semi-state. The rest is for institutions the state does not control. In addition the Board recommends \$5,000,000 for the care of the insane. This means \$24,000,000 in round numbers, a quarter of the state revenue, if the most favorable figure is taken.

\$6,000,000 More For Schools.—While bills for various increases in the educational allowances are appearing it commences to look as though there would not be more than \$6,000,000, perhaps \$8,000,000 at the very outside, added to the school appropriation. One of the teachers salary bills in hand calls for something like \$15,000,000 additional and there are sums yet due for teachers salary increases and for teachers retirement to be met. Then, too, there will be increases asked for administration, normal schools, aid of rural districts and various other objects. It is going to take some pretty strenuous work to get the funds needed for educational expansion in the face of the demands of the charities. The educational bills will probably take form after the school directors' conference here the second week in February as the thoughts of business end of the school administration as desired.

A Great Farm Show.—It is estimated over 30,000 persons attended the State Farm Products Show and the sentiment among them and the hundreds who were at meetings of organizations in session here was favorable to a State Fair. The Governor and other officials advocated it and resolutions favoring it were adopted. However, there does not seem to be any concerted movement in the Legislature for it. And meanwhile the people interested in local fairs are very much on the job. The corn and apple exhibits were notable and presence of the boys judging corn was an inspiration to many.

NEW YORK LETTER

Prison Population Reduced.—One year of prohibition cut prison commitments in this state more than one-half and reduced the prison population 17 per cent, according to the report of the State Commission on Prisons. The decrease amounts to 26,142 in a year. The report is for the year ending June 30. Since that time industrial depression has had the usual effect in increasing crime.

February Milk Price Drops.—The Dairymen's League advises its members to accept a drop of 60 cents a hundred pounds for February milk, although conceding that such price would be below cost of production. This will be \$2.58 for 3 per cent milk, in the 200-210-mile zone. The concession was made because of extremely bad market conditions. It averages a drop of 11 cents a quart, which the dealers, according to long custom, only to the consumers, according to long custom, which rule that increases in the wholesale price are passed on in full or a little more very promptly while decreases are halved or otherwise sliced in favor of the dealer's pocket.

Noted Agricultural Expert Retires.—Dr. W. H. Jordan, head of Geneva Experiment Station for 24 years, has announced his retirement. The state will find it very difficult to fill the position with a man who will serve farm interests in the face of financial and political pressure, so unfavourably and courageously as Dr. Jordan has.

Onions A Loss.—In Onondaga onion growers are offering onions at 10 cents a bushel net. Few shipments are being made. Local business men complain that onion growers are not able to make payments on supplies purchased of them, as the crop was a loss.

Milk Export Moved.—After spending two years in developing the big Auburn Dairymen's

League co-operative plant, the biggest yet built on the co-operative plan, the League has moved the Auburn manager, S. D. Williams, to its new plant at Burke, where a new farmer-owned powdered milk plant is being established.

Better Roads.—After two years of inactivity in the state's highway construction the new administration is putting into force sensible regulations. Long year after rather than long mileage is recommended. A map is to be presented to the Legislature when an appropriation for 1921 construction is asked. The map will show a connected system of improved roads, thus eliminating political and selfish purposes. Over 1200 miles of road will have to be repaired within the next three years. Many roads have been surveyed and some built for political purposes only.

Schools Closed.—The Federal officials say that 20,000 schools were closed in 1920 because of scarcity of teachers. New York rural schools have suffered greatly, as comparatively few are able to get competent teachers. Untrained young girl teachers have placed rural education on a poor basis in the state. This, with the unprofitable financial status of farming has placed the state's rural population at 1,794,000, which includes all villages under 2500 population, as compared to 8,589,000 in the cities of the state. Probably less than one-half of the so-called rural population really lives on farms.—M. G. F.

NEW JERSEY NEWS

Legislation Introduced.—Agriculturists in New Jersey are most interested in the following bills introduced in the Senate at the 1921 session of the Legislature. Allen, Salem, increases from \$2 to \$3 per day pay for freeholders in counties not granting them an annual salary; Mackay, Bergen, permitting county school superintendents to procure census in township school districts of persons between the ages of seven and sixteen years to better enforce attendance in classes; Stevens, Monmouth, authorizing State Commissioner of Education to name county medical inspectors; Stevens, Monmouth, fixing season for killing deer from December 15 to 20 and reducing period six days; Wallworth, Camden, reducing from five to three commissioners on Public Utility Board, leaving power of their appointment with the Governor, and fixing salary of each at \$12,000 per year; Parry, Essex, providing for open specifications on all road constructions in the state; Runyon, Union, requiring sheriffs, wardens of jails, etc., to furnish list of prisoners, such lists to go to organizations designed to aid prisoners in obtaining employment; Sturgess, Gloucester, requiring state motor vehicle commissioner to name ten persons to register motor vehicles in first-class counties; seven in second-class counties; five in third-class counties, and four in fourth-class counties, agents in the third and fourth-class counties to receive a fee of 50 cents for each license granted in lieu of other compensation; Case, Somerset, authorizing freeholders to alter rights of way and grades of highways by entering into contracts with owners; Case, Somerset, creating a state police department with two troops under a superintendent to be named by the Governor for a term of five years at a salary of \$5000 annually, giving troopers \$1200 yearly, and requiring superintendent and deputy captains and lieutenants to have served two years in the United States Army with rank not lower than lieutenant. House—Guthrie, Mercer, prohibiting employment of persons for more than six days in a week excepting workers in dairies, those caring for live animals, janitors, watchmen, bakers, etc.; Blackwell, Mercer, authorizing the governing body of any municipality to appropriate money in aid of volunteer fire departments; Lyons, Middlesex, making uniform the day for the annual organization of the boards of chosen freeholders in all of the counties of the state the first Monday in January; Franklin, Essex, enabling any judge of a court in counties of the first-class to appoint interpreters of any foreign language; Looft, Hudson, creating a pension for county detectives similar to that now in force respecting police officers; Pierson, Union, amends the election law of 1920 by providing adequate provisions for women voting; Downs, Morris, placing in the hands of the board of freeholders of the counties power to fix the amount to be paid for feed, maintenance, etc., per week for children committed to any institution.

Farmers to Co-operate.—The State Federation of Tomato Growers' Associations and the New Jersey Swine Breeders' Association has made definite arrangements with the State Federation of county Boards of Agriculture for the handling of their problems. The tomato growers have assisted the county board to assist them in perfecting their marketing methods and in other branches of their work. The Federation will name a state committee to be composed of prominent tomato growers for the purpose of making a special study of the tomato situation in New Jersey and offer to the federation recommendations for action. The state committee will co-operate with committees in the several counties to study local conditions. The Swine Breeders' Association has voted to abandon its charter and turn its work over to the federation. The executive committee of the county board has appropriated \$210 for support of an effort to reduce freight rates on peaches.—Kelly, Trenton.

VOLUME 49 NUMBER 6

OUR JOB is to serve our readers. Whenever you are puzzled, write to us and we will help you if we can.
—The Editors.

The moral and material bankruptcy of the accepted methods of statecraft helps to drive home the lesson, that only the Golden Rule of Christ can bring the Golden Age of Man.—Dr. Lawrence.

Co-Operative Associations

THE RECENT slump in the price of dairy feeds has brought us a number of letters asking why the co-operative associations charge the members more for feed than it can be bought for on the open market. To all such we would say, co-operative associations must expect to be affected by trade conditions just as are individual dealers. When prices drop after a supply is laid in, the members must bear the loss either by paying higher than market prices, or submit to assessment to pay the loss. Individuals who buy and sell commodities always face the possibility of loss thru falling prices, or of profiting if the market rises. A shrewd buyer endeavors to make one balance the other in a term of years. No kind of organization can be effected which will eliminate this element in business and farmers must learn to take their trade losses with others when they enter the commercial field.

The Farm Products Show

WHILE we expect to publish a somewhat detailed report of the State Products Show and the meetings held during the week, it is a duty to emphasize here the entire success of the show and to compliment those who engineered it. There is a lot of work about a project of this kind which the visitor may never realize as he interestedly views the exhibits or takes part in the meetings. The sincere thanks of the people of the state are due the State and Institutional officials who have voluntarily given their time and efforts in addition to their regular duties to make the show a success. It is estimated that 35,000 people were in attendance during the week and the universal opinion was that it was well worth the time and expense.

State Fair Project Grows

THE DEMAND for a state fair in Pennsylvania continues to grow in force and volume. The strong recommendation for a fair made by Governor Sproul in his message to the Legislature lends additional force to the movement. The resolutions passed by the different organizations which met at Harrisburg during the State Products Show week should have a marked influence upon the law-makers. In addition to the resolution passed by the Pennsylvania State Grange shows the sentiment of that representative and influential body. As soon as a proper bill is introduced into the Legislature it

Pennsylvania Farmer

will be the duty of the citizens to urge its enactment. We shall endeavor to keep our readers fully posted upon the progress of the movement.

The Governor's Message

GOVERNOR SPROUL'S message to the Legislature of Pennsylvania is an unusually strong and suggestive public document. He has had the courage to recommend some things which other Governors have avoided and it is to be hoped that the members of the Legislature will show a like courage in carrying out. The Governor's long service as member of that body serves him well in that it enables him to know personally the currents, cross-currents and undertows which agitate the members of the legislative branch of government.

His recommendations concerning the Brook's license law may not be in accordance with what some have proposed, but his explanation that some kind of law to regulate and control saloons even for the sale of drinks containing less than one-half per cent alcohol, and that a modification of the Brook's law to conform to the requirements of the Federal law is the simplest way out, seems reasonable. The message leaves no doubt as to his wishes to complement the Federal enforcement act by proper state legislation.

Governor Sproul properly appreciates the volume and importance of the agriculture of the state and recommends such legislation as will aid in furthering its development. He called attention to the value of a state fair and urged that steps be taken towards the establishment of a fair such as our agriculture and industry warrants.

Farmers who have for years urged the placing of additional tax upon corporations and coal producers will approve the Governor's recommendations in these respects. If any additional aid is to be given to the state institutions and projects more revenue must be produced. The present income will continue present activities but will not allow any increase or improvement. Taken all in all, the message is a sane, progressive paper and should have the backing of all forward-looking people.

Grange and Farm Bureau

WE PUBLISH this week on page 26 a communication from a well known Granger in Pennsylvania on the relationship between the Grange and the Farm Bureau. We have received during the past few weeks a number of letters, pro and con, on this subject showing that there is a decided difference of opinion among members of the Grange concerning the attitude the Grange should take towards the Farm Bureau movement.

We wish to state clearly the position of Pennsylvania Farmer on this subject and we hope that position will be taken by all who have the best interests of agriculture and rural institutions at heart.

First. The work of the County Agent has, in general, proven itself to be of great value. It is the most effectual way of carrying the findings of scientific investigation to the farm. The personal contact and suggestions of a live county agent have done more to induce farmers to practice improved methods of farming in the few years of its service than was done by bulletins alone in the previous 25 years. Recent experience has shown that the reduction of costs in production is the greatest single need in all lines of effort. Better systems and better methods do not necessarily mean increased production unless an increase is needed. Their adoption does mean, however, greater profits per man and per acre. The work of the County Agent has proven itself to be the most effective means of disseminating information to this end.

The Farm Bureau is the county organization which backs and which should direct the work of the County Agent. This organization should be and in most instances it is, composed of leading, progressive farmers. The question at issue just now is: How large, how active and how ambitious should this organization be? Should it aspire to cover all subjects in which farmers are interested—social, business, education, politics, etc., or, should it confine itself to the field of

spreading the knowledge of improved methods and more economical practices? Personally, we are inclined to the latter plan, and to make it most effective we would recommend that every farmer become actively interested in the work in his county. If this kind of work can be better accomplished by federation, then federate. But it is extremely doubtful whether the conditions in our territory demand the same course as is being pursued in the western states. What is needed here is to study conditions as they exist and develop such activities as are needed. It is not necessary to copy the program of another section where the needs and conditions are radically different.

Second. The oldest, strongest and most influential farmers' organization in the East is the Grange. For more than 50 years it has served well the farmer and his family. Its principles and traditions are well established; it has played the chief part in bettering social conditions in the country and has also a respected influence in the halls of legislation; its principles lie at the base of all right action and its teachings inspire to a better manhood and a better womanhood; it fills a place in rural sociology that no purely business organization can ever attain. It has the facilities for inspiring the promotion of other and specific organizations in the community. For these and other reasons we stand firmly back of the Grange and its principles and want to see them still further extended.

With this definition of the work of each, there is no occasion for any jealousy and antagonism between these two great movements. We hope there will be none, but rather that all farmers will join in making both still more effective and more useful in promoting the best interests of farming and the rural life.

Our Washington Letter

The agricultural appropriation bill, covering the expenditures of the Department of Agriculture for the next fiscal year, is now before the House, and is receiving much attention. It carries a total of \$33,517,459, which represents an increase of \$1,875,495 over the present year's appropriation, but is \$19,511,925 less than was asked for by the department.

Of this increase \$875,495 represents the additions to the regular items, while the remaining \$1,000,000 is for the purchase of timber lands. Live stock men asked for \$1,000,000 for bovine tuberculosis eradication work, and the committee allowed \$498,360 for this purpose. An increase of \$50,000 was allowed in the appropriation for dairy investigations. The appropriation for hog cholera eradication was increased by \$100,000 over the present year's appropriation. An increase of \$150,000 was allowed for the control of the brown tail and gypsy moths. A new item of \$100,000 was added to the control of the Mexican bean weevil. Two new offices are created by the bill, a director of scientific work and a director of regulatory work. The bill provides for the consolidation of the Bureau of Markets and Bureau of Crop Estimates, with an appropriation of \$2,939,440. The appropriation of \$233,000 for the annual free distribution of seeds was eliminated, but an amendment introduced by Congressman John W. Langley of Kentucky, provides for an appropriation of \$360,000 for the Congressional seed distribution, was carried by a vote of 83 to 72. Representative McLaughlin of Michigan tried to have the amount of the appropriation reduced to \$240,000 but his amendment was lost. "I think that by continuing this appropriation for the distribution of vegetable seeds," said Representative Langley, "we assist in preventing profiteering by the seed dealers. If we discontinue the congressional distribution of seeds, as the committee proposed, it is my opinion that the private seed dealers will immediately advance their prices 20 or 25 per cent, and perhaps more, so that my amendment is intended partly to prevent profiteering at the expense of the farmers." And the House proceeded with this farce comedy without apparently sensing the ridiculousness of the situation.

Efforts are being made on the floor of the House to amend the bill, mostly for the purpose of reducing the total amount written into it by the committee, by cutting out various items. So far, however, nearly all these amendments have been defeated by a fair majority, indicating that the bill will reach the Senate in practically the same form as it came from the committee.

In the hearings, Assistant Secretary of Agriculture E. D. Ball pointed out that the Department of Agriculture has more research men in its employ than all other lines of government effort. The Department of Agriculture has 373 scientific men, all other bureaus have 3296 men. Comparing salaries paid in the Army and Navy with those paid in the Department of Agriculture, Dr. Ball said the colonel in the Army, captain in the Navy, assistant surgeon general, hydrographic

February 5, 1921.

February 5, 1921.

or geodetic engineer, after the first five years, get \$6330. The lieutenant colonel of the Army, commander in the Navy, senior surgeon and hydrographic engineer of the same rank, after the first five years, get \$5120. The major of the Army and Lieutenant commander of the Navy get \$4165. The first lieutenant of the Army gets \$3427, about the average received by leaders of the great projects of the Department of Agriculture. The average salary they are getting now is \$3443. This means that the lieutenant in the army ranks with the men handling the big work of the Department of Agriculture. The Treasury Department has 94 men here that draw salaries ranging from \$10,000 to \$12,000; the other departments of government have 371 men receiving \$5000 or more against one man in the Department of Agriculture receiving as much as \$6000, and nine men receiving \$5000. The farmers of Illinois are paying their county agents an average of \$260 more per year than is received by the project leaders in the Department of Agriculture.

Hearings on the general revision of the tariff, before the Ways and Means Committee of the House of which Representative Joseph W. Fordney of Michigan is chairman, have been in progress for some time. Three days were given to the agricultural schedules. The committee is affording the producers every opportunity to state their case, with the evident desire of securing the largest possible amount of information as to the needs of the various groups of farmers for a protective tariff on their products.

Dr. T. C. Atkeson, representing the National Grange, discussed the tariff problem from the standpoint of the greatest good to the greatest number. He said industry needs to note the fact that the farmers, although buyers at the market of everything the protected American industries manufacture, seek no reduction in the process of these products such as would come from open competition with the world. Although numbering more than a third of the population, and being consumers of the products of American urban industries to a value at least proportionate to their numbers, they ask no free trade competition to enable them to buy cheaply. It was emphasized by Dr. Atkeson that the product of the farm is as much a finished product as that of the mill or factory; that farm crops are not raw materials, and in any tariff discussion they should be considered along with other finished manufactured products.—E. E. Reynolds.

HARRISBURG LETTER

Delays in New Legislation.—While the number of bills poured into the two branches of the Legislature is greater than known at this period of a session in a long time the absence of many measures which have been much discussed in the last year has been a disappointment to quite a few members of the general assembly who had looked for bills to be submitted promptly and a program to be a thing of black and white. As it is, the State Highway Department is the only one to have its bills in hands of the committees and they call for something like a dozen million with some readjustments of methods of disbursements of funds when not matched by counties. The Governors' bills are either in sketches or in the hands of the Attorney General who received them only recently, while the Health Department measures, which rumor says will take something like \$8,000,000, have not showed up. Other bills are in the hands of draftsmen and the result is that it will be well in February before what was talked of in September is in hand. At the same time there is a disposition among members of the House to insist upon a date for adjournment in April being set and as the idea is favored by men in high places if not by some in Harrisburg it may work out. There is no questioning the fact that there is latent temper in the House and enough misplays were made in handling jobs to induce people to stir it up when the session gets to running strong.

What \$90,000,000 Means.—Governor Sproul's declaration in favor of a \$90,000,000 limit to appropriations was, of course, prefaced upon there being no new tax legislation, and it is hard to say whether there will be any. The coal tax bill, but whether there will be much motive power remains to be seen. The Governor's statement is being interpreted here more in the nature of a warning not to bring in many salary raisers and as a curb on new jobs, while also conveying the idea that the Governor's pen is the last to work on a bill. The Governor has some ambitious plans for legislation, but is now disposed to await business developments to see how the money will come in. A decrease in revenues under the present system is anticipated, although not being noised about very much.

The Fancy Stuff.—It seems probable the Legislature will be rather rough with some of the legislation classed under the head of measures for the welfare of the race and that a disposition to be more solicitous of the health of a child of six than for jobs in pre-natal clinics will be manifested. Some indication of just what is going to happen may be gained from the fact that the bill to regulate explosives which would have

Pennsylvania Farmer

7-139

evolved a state system of control, with jobs, was abandoned by the people behind it after "conferences." It may transpire that some of the frills which have replaced old Health Department methods may also be given up. There is a tendency among legislators to scrutinize pretty closely Public Service bills and to put the fiscal affairs of Father Penn on a more business like basis. The Departments of Agriculture and Forestry will probably have the most sympathetic ears of any on Capitol Hill because it is recognized both have been running along with a low supply of gasoline, so to speak, and are capable of meeting considerable needs if given the funds. Unfortunately the legislation to carry out their plans have not yet appeared and can not be forecast.

Forests That Will Pay.—Commissioner Gifford Pinchot is confident that State can show a return on money invested in forest lands that will be a very important addition to the school funds in a short space of years. He believes there is land now available, if the state will make the necessary appropriations, that can be made to earn handsomely against the time when the state will be casting around for revenue. The commissioner also believes the showing from lands now operated in rather indicative of what can be done.

A \$3,000,000 Jump.—The State Board of Public Charities has recommended \$19,231,000 be appropriated to state, semi-state and non-state charities. Last session \$16,544,000 was appropriated. The sum of \$1,500,000 is recommended for purely state institutions over and above what they got last session and less than \$100,000 for the semi-state. The rest is for institutions the state does not control. In addition the Board recommends \$5,000,000 for the care of the insane. This means \$24,000,000 in round numbers, a quarter of the state revenue, if the most favorable figure is taken.

\$6,000,000 More For Schools.—While bills for various increases in the educational allowances are appearing it commences to look as though there would not be more than \$6,000,000, perhaps \$8,000,000 at the very outside, added to the school appropriation. One of the teachers salary bills in hand calls for something like \$15,000,000 additional and there are sums yet due for teachers salary increases and for teachers retirement for administration, normal schools, aid of rural districts and various other objects. It is going to take some pretty strenuous work to get the funds needed for educational expansion in the face of the demands of the charities. The educational bills will probably take form after the school directors' conference here the second week in February as the thoughts of business end of the school administration as desired.

A Great Farm Show.—It is estimated over 30,000 persons attended the State Farm Products Show and the sentiment among them and the hundreds who were at meetings of organizations in session here was favorable to a State Fair. The Governor and other officials advocated it and resolutions favoring it were adopted. However, there does not seem to be any concerted movement in the Legislature for it. And meanwhile the people interested in local fairs are very much on the job. The corn and apple exhibits were notable and presence of the boys judging corn was an inspiration to many.

NEW YORK LETTER

Prison Population Reduced.—One year of prohibition cut prison commitments in this state more than one-half and reduced the prison population 17 per cent, according to the report of the State Commission on Prisons. The decrease amounts to 26,142 in a year. The report is for the year ending June 30. Since that time industrial depression has had the usual effect in increasing crime.

February Milk Price Drops.—The Dairyman's League advises its members to accept a drop of 60 cents a hundred pounds for February milk, although conceding that such price would be below cost of production. This will be \$2.58 for 3 per cent milk, in the 200-210-mile zone. The concession was made because of extremely bad market conditions. It averages a drop of 14 cents a quart, which the dealers which pass in part only to the consumers, according to long custom, which rules that increases in the wholesale price are passed on in full or a little more very promptly while decreases are halved or otherwise sliced in favor of the dealer's pocket.

Noted Agricultural Expert Retires.—Dr. W. H. Jordan, head of Geneva Experiment Station for 24 years, has announced his retirement. The state will find it very difficult to fill the position with a man who will serve farm interests in the face of financial and political pressure, so unflinching and courageously as Dr. Jordan has.

Onions a Loss.—In Canastota onion growers are offering onions at 10 cents a bushel net. Few shipments are being made. Local business men complain that onion growers are not able to make payments on supplies purchased of them, as the crop was a loss.

Milk Expert Moved.—After spending two years in developing the big Auburn Dairyman's

League co-operative plant, the biggest yet built on the co-operative plan, the League has moved the Auburn manager, S. D. Williams, to its new plant at Burke, where a new farmer-owned powdered milk plant is being established.

Better Roads.—After two years of inactivity in the state's highway construction the new administration is putting into force sensible regulations. Long yearage rather than long mileage is recommended. A map is to be presented the Legislature when an appropriation for 1921 construction is asked. The map will show a connected system of improved roads, thus eliminating political and selfish purposes. Over 1203 miles of road will have to be repaired within the next three years. Many roads have been surveyed and some built for political purposes only.

Schools Closed.—The Federal officials say that 20,000 schools were closed in 1920 because of scarcity of teachers. New York rural schools have suffered greatly, as comparatively few are able to get competent teachers. Untrained young girl teachers have placed rural education on a poor basis in the state. This, with the unprofitable financial status of farming has placed the state's rural population at 1,794,000, which includes all villages under 2500 population, as compared to 8,539,000 in the cities of the state. Probably less than one-half of the so-called rural population really lives on farms.—M. G. F.

NEW JERSEY NEWS

Legislation Introduced.—Agriculturists in New Jersey are much interested in the following bills introduced in the Senate at the 1921 session of the Legislature. Allen, Salem, increases from \$3 to \$5 per day pay for freeholders in counties not granting them an annual salary; Mackay, Bergen, permitting county school superintendents to procure census in township school districts of persons between the ages of seven and sixteen years to better enforce attendance in classes; Stevens, Monmouth, authorizing State Commissioner of Education to name county medical inspectors; Stevens, Monmouth, fixing season for killing deer from December 15 to 20 and reducing period six days; Wallworth, Camden, reducing from five to three commissioners on Public Utility Board, leaving power of their appointment with the Governor, and fixing salary of each at \$12,000 per year; Parry, Essex, providing for open specifications on all road constructions in the state; Runyon, Union, requiring sheriffs, wardens of jails, etc., to furnish list of prisoners to be discharged within the following two months, such lists to go to organizations designed to aid prisoners in obtaining employment; Sturges, Gloucester, requiring state motor vehicle commissioner to name ten persons to register motor vehicles in first-class counties; seven in second-class counties; five in third-class counties, and four in fourth-class counties, agents in the third and fourth-class counties to receive a fee of 50 cents for each license granted in lieu of other compensation; Case, Somerset, authorizing freeholders to alter rights of way and grades of highways by entering into contracts with owners; Case, Somerset, creating a state police department with two troops under a superintendent to be named by the Governor for a term of five years at a salary of \$5000 annually, giving troopers \$1200 yearly, and requiring superintendent and deputy, captains and lieutenants to have served two years in the United States Army with rank not lower than Lieutenant. House—Guthrie, Mercer, prohibiting employment of persons for more than six days in a week excepting workers in dairies, those caring for live animals, janitors, watchmen, bakers, etc.; Blackwell, Mercer, authorizing the governing body of any municipality to appropriate money in aid of volunteer fire departments; Lyons, Middlesex, making uniform the day for the annual organization of the boards of chosen freeholders in all of the counties of the state the first Monday in January; Franklin, Essex, enabling any judge of a court in counties of the first-class to appoint interpreters of any foreign language; Loomis, Hudson, creating a pension for county detectives similar to that now in force respecting police officers; Pierson, Union, amends the election law of 1920 by providing adequate provisions for women voting; Downs, Morris, placing in the hands of the board of freeholders of the counties power to fix the amount to be paid for food, maintenance, etc., per week for children committed to any institution.

Farmers to Co-operate.—The State Federation of Tomato Growers' Associations and the New Jersey Swine Breeders' Association has made definite arrangements with the State Federation of county Boards of Agriculture for the handling of their problems. The tomato growers have asked the county boards to assist them in perfecting their marketing methods and in other branches of their work. The federation will name a state committee to be composed of prominent tomato growers for the purpose of making a special study of the tomato situation in New Jersey and offer to the federation recommendations for action. This state committee will co-operate with committees in the several counties to study local conditions. The Swine Breeders' Association has voted to abandon its charter and turn its work over to the federation. The executive committee of the county boards has appropriated \$210 for support of an effort to reduce freight rates on peaches.—Kelly, Trenton.

Wood is Scarce—Coal is High Build a WARM House

WITH the winter winds howling and the cold creeping through the thin weatherboards, the family in grandfather's boyhood hugged the stove a little tighter, while someone hugged another armful of wood. But today, firewood is fast disappearing and the cost of coal climbs steadily higher. The remedy is a warm house—built of

Natco XVV
Hollow Tile
used in walls
that are
stuccoed.

Natco Hollow Tile

The still-air spaces in the walls resist temperature changes and prevent dampness. These walls require no painting and will not burn or decay. The saving in coal bills, upkeep and insurance make a Natco House cheapest in the long run.

Our free book, "Natco on the Farm," describes Natco buildings of many types. Write for it today.

The Development of Milking Machines

ONE of the important problems in milk production is that of labor involved in milking, and efforts have been made to perfect a mechanical milking machine which will perform this operation as well as the hand milker. The present mechanical milkers are not perfect yet they are so far advanced over the first experimental machines that they may be classed among the practical labor saving machines for the dairy farmer.

As early as 1819 work was started on the invention of milking machines but no definite information can be obtained concerning their description or illustration. The simplest scheme of milking was the use of straws which were inserted in the cows teats and the milk allowed to run from the milk cistern. However, straws were not used for any length of time as they were more or less contaminated and soon injured the udders. They served a very useful purpose though by leading up to work, beginning in 1878, on the actual development of the mechanical milker which was based upon following principles.

Among the early mechanical milkers developed on the principle of milking by pressure were two invented in Pennsylvania and the one present popular suction milking machine was developed in this state and is now being manufactured in large numbers to supply the ever increasing demand for a reliable mechanical milking machine.

"A Winner." Registered Ayrshire, Masonic Home, Pa.

The first, the milk tube, working on the same principle as the straw noted above, is an apparatus that provides an opening into the milk cistern and allows the milk to flow from the udder. While this system is practical in some instances, as in diseased udders, it however, becomes dangerous and impractical under average dairy conditions, owing to the fact that it is essential to sterilize and keep sterilized that part of the milk tube which is inserted into the teats.

The second step in the development of the milking machine was the use of pressure which was applied at the base of the teat, closing the milk duct, and then forcing the milk out by applying a downward pressure upon the teat.

The third principle was based on suction; the teat being placed in a cup out of which air was exhausted producing a vacuum. The atmospheric pressure of the air on the surface of the udder tends to force the milk into the milk duct of the teats where it is drawn out by the vacuum in the teat cups. This suction is produced by a pump and the principle

The modern mechanical milker employs suction for drawing the milk and either atmospheric or a stronger pressure for massaging the teats in order to restore the normal blood circulation. A general classification of milking machines may be based on the kind or strength of pressure used in massaging the teats or else the machines may be grouped according to the type of teat cup employed. For example, one group uses a single chambered teat cup which has only one action and draws the milk out by suction without any mechanical aid to the blood circulation while the other group makes use of a double chambered teat cup which alternately draws the milk by suction and then massages the teats with air pressure.

The modern mechanical milker although not a perfect machine is both a practical and a safe labor saving device for the dairyman with a fair-sized herd. This has been proven both by experimental work and by the large number of satisfied users of the various makes of machines on the market.

Failures with milking machines in

the past have been rather numerous but these have been largely due to the fault of the operator rather than any serious fault of the machines. Of the several factors entering into the success of mechanical milking the operator is the most important. He must not only have a working knowledge of the mechanical operation of the machine but he must also have a thorough knowledge of the peculiarities of each cow in order to best milk each individual. Then, too, he must see that each part of the machine is kept scrupulously clean. When these factors are carefully carried out any one of the modern standard mechanical milkers should prove successful for the average dairy farmer.

Handling Milking Machines

Success of mechanical milkers depends upon

1. Operator
2. Cow
3. Machines.

1. The man operating the milkers must thoroughly understand their care and working principles. He should follow all directions given by manufacturers.

2. One man can handle properly, two double units or three single units.

3. Operator should understand how each cow milks.

4. Some cows do not milk well with machines on account of excitability, tendency to hold up milk or abnormally shaped udders.

5. Unless cows are too valuable it pays to cull out those that are not successfully milked with machines.

6. Milking machines, when properly handled do not cause udder troubles. Be sure to remove machines as soon as no more milk comes down and finish stripping by hand promptly.

7. Experiments covering 5 years at Geneva Exp. Station show that machine milking, if properly done does not influence flow of milk to any extent capable of measurement.

8. When not in use keep teat cups and tubing immersed in solution of chloride of lime and salt. If they become dry between milkings, the rubber will crack.

9. Rinse machine and parts well before each milking.—A. L. Beam.

DANGEROUS COWS

Twenty-five dairy cows driven across the Maryland-York county line by cattle dealers in violation of the Interstate Cattle Law, were quarantined and inspected by agents of the Bureau of Animal Industry, Pennsylvania Department of Agriculture, and nine, or 36 per cent., of the cows were found to be so badly diseased that they were condemned for fertilizer.

The state line is being closely watched by bureau agents, and the state officials, in co-operation with the Federal Department of Agriculture, are exerting every effort to break up this illegal traffic in diseased cattle.

Prospective purchasers are warned against buying cattle unless a bona fide health certificate for each animal is furnished.

The diseased cattle in this instance were to have been offered at public sale in a section of Chester county which contains hundreds of good dairies. Had they not been caught and held by state agents they would, undoubtedly, have been bought by unsuspecting farmers, placed in their herds, with the result that tuberculosis would have spread.

"The machine made it possible for me to do my work alone this year and more than paid for itself in the savings of wages this summer." —WILL HANFELD.

How Perfection Pays For Itself

NO doubt you have often thought, "If I could only do the milking I could get along with less help or even do my work alone." Here's the opportunity to put that thought into action. Get a Perfection and you can do your work with less help or alone.

One man with the Perfection can milk the same number of cows as three hand milkers. You can easily milk 24 to 30 cows an hour with the Perfection Milker.

Thousands of owners say that Perfection easily pays for itself in less than a year on

wages saved. But more than this the Perfection is unusually low in upkeep and costs but a few cents a day to operate.

Furthermore owners say, that their cows give more milk when milked with the Perfection. Cows like the Perfection's natural action. It's just like their calf's milking.

You are paying for a Perfection every year in wages to hired men—why not have it?

Send For Catalog

Send for your free copy of our book, "What the Dairyman Wants to Know." It answers every question about milking machines. At the same time we will send the names and addresses of Perfection owners near you. Why Milk By Hand? Perfection milking is more profitable.

PERFECTION MILKER

EVERY GRAIN All Pure Salt

Put Colonial Special Farmer's Salt under the magnifying glass and you'll see fine, soft, flaky crystals—every one separate—every one pure salt. Then try it in your cooking, baking and butter making. For meat curing, too. Taste the fine, full salt flavor that improves everything it touches. You will never buy any salt except

COLONIAL SPECIAL FARMER'S SALT

All Ready to Use
No breaking up, no sifting. Packed in easy-to-handle 70 pound bags which are equal in size to hundred pound bags of ordinary salt, because this better brand contains no moisture. Dissolves instantly, never varies in strength. The bags make splendid toweling when empty.

Get the Genuine
No cheap, inferior salt will work as fast nor as thoroughly as Colonial Special Farmer's Salt. Always get the genuine salt, because this better brand contains no moisture. Dissolves instantly, never varies in strength. The bags make splendid toweling when empty.

Manufactured by
The Colonial Salt Co., Akron, Ohio

HORTICULTURE

Cutting the Costs in Fruit Growing

J. P. STEWART

TWO outstanding facts have been developed from the experience of the present season. One is the necessity of greatly reducing the costs of production and the other is the need of greatly improving the quality of the product, if the average fruit grower is to remain in business. During the last couple of seasons preceding the present one, almost any kind of fruit would sell, mostly at a profit, but right now nothing but the best is wanted at all, and in many cases the profits that would otherwise accrue from the best are all eaten up in handling the off-grade stuff.

Some of the important ways in which the costs of production may be lowered without reducing the final quality of the product are by making some of the principal spraying materials at home, and by confining ones' purchases of fertilizers to the simple, unmixed materials. The wider use of the bulk shipment, thus eliminating both package and grading costs, is also an important resource, which is likely to be even more in evidence next fall than now. This form of shipment has been used very extensively and successfully in shipments of apples to the South and West this year, and has even made its appearance in some recent shipments of citrus fruits to the north.

The improvement in the quality of the product, as already pointed out in this column, is likely to come chiefly as a result of more and better use of the practices of pruning and thinning, and picking at the right degree of maturity. In connection with the thinning item, we may simply point out the fact that the thinning of certain varieties in the experiments in West Virginia increased the amount of marketable fruit by as much as 100 per cent in some cases, and as the surplus fruit would naturally have had to be taken off some time, and possibly would have been run over the grader if left until the regular picking, it is evident that this gain was secured practically without cost.

Making the Lime-Sulphur Spray

There are two important reasons for making the lime-sulphur spray material at home this year. One of these is the important saving in cost that can thus be effected, and the other is the fact that it is becoming increasingly difficult for the average grower to buy the liquid solution on the market at any price. This is because the dry preparations of so-called soluble sulphur are more convenient for the dealers to handle, and they are therefore dropping the liquid preparations entirely in many cases.

The gradual increase in price and deterioration in density of the commercial solution during the war and subsequent period, have materially increased the chances for distinct saving in the home preparation.

In the first place, it may be recalled that our original formula for this preparation called for one pound of lime to two pounds of sulphur to one gallon of finished product. This gave a concentrate of reasonable density,

averaging about 1.24 on the specific gravity hydrometer, and also dissolved the materials fairly well, leaving only a moderate amount of sludge when the materials and manipulation were good.

To get still less sludge and hence possibly a better utilization of materials, we later used and advised a little more water in the final product, thus giving a formula of about 1-2-1, instead of 1-2-1 as in the original formula. On this later formula, a very convenient quantity to make, especially with a 75-gallon cooker, is 45 lbs. of lime, 90 lbs. of sulphur and water enough to make 60 gallons of final product. Such an amount and proportion when properly made usually gives a density of 1.22 or better, with almost no heavy sludge or sediment.

One important precaution which should be mentioned in this connection is the necessity of keeping the volume at or above the desired final volume during the entire period of boiling, as otherwise the best dissolving of the materials is not secured. Occasionally we hear of some one who is doing the cooking with a relatively small amount of water, and then diluting the mass up to the desired final volume at or near the close of the boiling. He then wonders why he doesn't get better results. This course naturally is accompanied by all the evils of the boiling at greater densities, with none of the advantages of lessened storage space, as this is lost by the partial dilution near the close of the boiling.

There is also far too little attention paid to securing a really correct dilution of all kinds of concentrates when it comes to the actual spraying, and apparently considerable misunderstanding of how this dilution is correctly obtained. We have recently heard special lecturers on the subject advocating only the testing of the diluted spray material in the tank in order to determine whether the proper dilution had been made or not. This, of course, is impracticable as well as very inaccurate unless special precautions have been taken to get a thorough mixing of the contents of the tank before the reading is taken, and also unless a special hydrometer with extra wide spaces between degree or decimal marks is used.

The proper method of doing the diluting is to get the reading of the concentrate with a specific gravity hydrometer, and determine the rate of dilution from this either with the aid of a dilution table or by dividing the decimal of the concentrate reading by the decimal of the density of the desired spray. For example, if the concentrate shows a density of 1.24 and we are spraying for San Jose scale which requires a spray of the density of 1.03, we divide the .24 by .03 which gives a quotient of 8, and this is the total number of volumes to which the 1.24 concentrate must be diluted in order to leave a density of 1.03.

When the rate of dilution is determined, the practical way of making the dilution is to calculate the

number of gallons of concentrate required make the tank of desired spray and add it to the tank before the water and other materials are put in. This calculation is made by dividing the number of gallons which the tank holds by the number in the dilution rate. For example, if the tank holds 250 gallons and the rate of dilution is 8, the number of gallons of lime-sulphur required is one-eighth of 250, or about 31, to make the tank full at the density required.

This probably sounds a lot more complicated than it really is, but in any case, this process or its equivalent with the aid of dilution tables should be followed, whether the lime-sulphur concentrate is made at home or bought, as the commercial forms have been varying very widely of late, and it is totally unsafe to apply them without a definite test.

The other important precaution in making the concentrate at home is to make sure that the quality of lime is right. This means that it should be high in calcium and low in magnesium. Good, freshly burnt, stone lime carrying at least 90 per cent of calcium oxide should be used, and the higher this percentage can be exceeded without undue expense the better. Fortunately such lime is very generally available in most of the fruit sections of this state, at moderate prices. Hydrated lime can be used, but it has no advantages as compared with the unslaked form, and a third more is required.

NEXT WEEK'S FARM WORK

By R. W. DeBaun

For a whole year, I have been too busy to write an article for my Pennsylvania Farmer friends. The reason I have been so busy is because on Feb. 1, 1920, brother and I bought jointly two large vegetable farms near Newark, N. J. We have 150 acres in all, approximately 100 acres under the plow and much of that is being double cropped. Anyone who tells the farmers that they have nothing to do in winter has never been a good farmer.

We are planning to put a new roof on our bay barn and on the "lean to" shed which is used to stable our two cows and two heifers. The old roof has been on for perhaps thirty-five years. The shingles are unusually long so that the underlying shingle is too far apart for the cedar express shingles which are on the roof today at from \$12 to \$15 per thousand. Rather than replace the shingle lath for the shorter shingles, I will remove them and cover the roof with shiplap inch-thick boards. This will be covered with the newly devised heavy tarpaper, grit covered shingles. They can be secured for \$5.50 per thousand and are guaranteed for 20 years. The fun of it is that the new angled shingles can be laid very quick as they are perfectly uniform and four of them are in one piece. Any farm help can lay them. Last spring "The Annex" was built onto the church for suppers, entertainments, etc. The patent shingles were used and the work was done well and quickly by our neighbors. Therefore, the patent shingles gave advantages over the wooden ones.

Down in our woods there are at least a dozen large straight pin oaks free from knots. One of these days we will have to build a new house. Pin oak floor beams or studding, unless used green, gets so hard that it is quite impossible to drive nails into them. However, flooring is expen-

The Complete Dormant Spray

— controls aphids too

BULLETIN 184 of the Mass. Exp. Sta., on page 52, shows that Scalecide (1 to 15) was 100% efficient in killing aphids while hatching and with only "slight injury" to foliage when "34 inch open."

On the other hand, lime-sulphur (1 to 8) killed less than 10% of the aphids and caused "considerable injury"; and lime-sulphur (1 to 8) with nicotine sulphate (1 to 800) added, although effective, also caused "considerable injury," the same as when lime-sulphur was used alone.

Scalecide controls aphids, when applied as a delayed dormant spray, as the buds are showing green and the aphid eggs are hatching. And it not only controls aphids, scale, leaf-roller, bud-moth, case bearer and other insects that winter on the bark, but also kills fungous spores and controls disease—it is "the complete dormant spray"!

Scalecide Requires Less Labor

One barrel of Scalecide, which makes 800 gallons of spray, will cover, until they drip, as many trees as three and a half barrels of lime-sulphur, which make 1600 gallons of spray. And of course you can apply 800 gallons of Scalecide with much less labor than 1600 gallons of lime-sulphur.

Scalecide Is Pleasant To Use

Scalecide is soothing, healing and antiseptic to the skin of man or beast, whereas lime-sulphur is caustic and disagreeable. Scalecide does not injure even the eyes. It does not corrode the spray pump nor clog the nozzles, and being an oil, it makes the pump run easier and last longer.

Every Claim Has Been Proved

Every claim we make for Scalecide has been proved in our own large orchards, which now total 26,000 trees, and verified by growers throughout the U. S. We speak to you from 10 years' experience as fruit-growers, and our recommendations are based upon profitable orchard practice.

Order Your Scalecide Now

Get your supply of Scalecide now. Though we have doubled our factory capacity, we anticipate difficulty in meeting the demand. Order early and avoid disappointment. See the local Scalecide agent today. If there is no agent near you, write for free booklet, guarantee and prices. Address Dept. 27

Good fertilizers always pay

There never was a time when good fertilizers, with any kind of a fair chance, didn't pay for themselves and leave a profit besides. And especially now good fertilizers extend a helping hand toward off-setting declining prices by increasing yields.

Furthermore, by increasing the number of bushels per acre good fertilizers cut down the cost of production. They produce and they save—they earn at both ends. They are an investment in *crop insurance*!

A A C Fertilizers, under whatever brand you may know them, are good fertilizers. Their formulas represent years of indefatigable study of soils, plant life and plant foods. In co-operation with practical farmers, our chemists and agronomists are continually making field tests in various sections. Let them suggest the fertilizers which will grow the largest and most economical crops on your soil.

Consult us on any matter pertaining to crops and soil fertility. When writing ask for booklet on "How to Get the Most out of Fertilizers." It's free.

If there isn't an A A C agent near you,
we want one. Write for the agency.

GREEN'S NURSERY COMPANY
Box 33 Rochester, N. Y.

sive. Pin oak makes splendid oak floors, beautiful material for trim around windows and doors, baseboards and stairways. Therefore, we plan to get the trees to the saw mill and have them ripped up into 1½-inch boards. This material will be stacked under cover with slats between the boards. In that condition it will season beautifully and be solid and straight. Then when the time comes to build, the lumber will be taken to the planing mill and be put in just the shape and condition we desire to have it.

Our cross cut log saw needed attention, so one rainy day last week I set the teeth and then ran a flat file lightly over the points of the teeth. In this way I found which teeth were too long for their neighboring teeth. It took more time to file the saw than I supposed it would but now it is in perfect readiness. Saturday night while in town I stopped to get three wedges for felling trees. Prices may be coming down, but when the hardware man said 95 cents apiece I said "I'll take two and if I can find the old crippled wedges we used last year I may return one of these."

It seems to be human nature to enjoy doing big things such as felling mighty oaks. Those big oak trees weigh perhaps ten to fifteen tons with all the branches and yet we can make them fall exactly where we want them to lay. Nearby trees might prevent a falling tree from coming down, therefore, it is necessary to drop them just where they can fall all the way down. First, we decide where we want the tree to fall. Then with the axes, we make a wide flat notch into the side of the tree, 6 to 12 inches deep; just above the "flare out" caused by the roots and yet as low as convenient. The notch is made level and the back of the cut is made perfectly straight. Then we begin sawing from the other side; at all times we try to hold the saw level and parallel with the notch made by the axes. When the saw is far enough into the log, the wedges are inserted to prevent the saw from binding. At all times, wedges are kept tight and when a strip about two inches wide is left between the saw and the notch, the wedges are forced in a little. At this time the sawing is done very carefully. If the greater weight of trunk and branches is on one side, more wedges are placed on that side and less sawing is done on the opposite side. Thus, the wedges on that heavy side help to take the weight and by holding a little extra unsawed strip on the opposite side from the weight, the tree is prevented from falling where it would otherwise be likely to go. We space the wedges about six inches apart so that it is convenient to hit one at a time with the beetle. Under all conditions the unsawed section, especially opposite the heavier side must be kept at least an inch across. By watching the wind and the swinging of the tree, the wedges can be made to force the tree into the direction we wish to have it go. Before the tree falls we place a short log about six feet from the tree. Then as the tree falls, the butt end will be supported above ground. This prevents the butt from settling into the mud and from becoming frozen fast. Furthermore, when the log is supported a few inches above ground, it is much easier to get the loading skids in place and the log chains can be put around the log with ease. We find it convenient to trim a tree as soon as possible after it is felled. The side branches are

cut off close to the trunk and with the surface of the cuts quite smooth to the saw log.

The log gets smaller the farther we get from the stump. Therefore, it is folly to try to get the saw log too long. The sawyer has to square the log according to the size of the upper end. That is why we lose if we try to gain unwisely. The topwood of the tree is cut into lengths convenient to take it to the woodpile there to be cut into fire wood with the power saw. The time to burn the brush is while you are on the job. Otherwise it may remain an emblem of "good intentions" or neglect.

By having the logs ready to load, we can watch for good sleighing to slip them to the mill on the heavy logging sleds. It is very easy to load logs on a low down sled but it requires more time and power to load onto wagon sand to have the logs on wheels over the soft soil in the woods.

SOLVING MUCK LAND PROBLEMS

The annual field day of the growers of vegetable crops on muck lands in central and western New York was held at Williamson, Wayne County, Sept. 6. Williamson is the center of an extensive vegetable growing industry, the principal crops being lettuce, celery and onions.

Under the direction of the Williamson Vegetable Association in co-operation with the country farm bureau visits were made to several large tracts of muck land to inspect a number of demonstrations that are being carried on by H. W. Dye, plant pathologist, who is employed by the Williamson growers in connection with the State College of Agriculture to investigate muck land crop diseases and discover means for their control.

On one of the farms Mr. Dye gave a practical demonstration of the effectiveness of formaldehyde in the control of onion smut. In one field test the plot treated with formaldehyde yielded 253 bushels of onions, the check plot yielded 98 bushels per acre. In another test there was 30 per cent of smut in the untreated plot and four per cent in the treated plot. The yield was 656 bushels of onions per acre on the treated plot and 356 bushels per acre on the plot where no formaldehyde was used.

In the field where these tests were made there have been no onions grown in nine years until the present season, yet it is infested with smut, showing that crop rotation is of little value in reducing the amount of smut in a field.

The formaldehyde solution was applied in the furrow with the seed at the time of sowing. The solution used is made by adding one pint of commercial formaldehyde to 16 gallons of water. This solution is applied at the rate of 200 gallons per acre. The application is made by means of a watering device attached to the drill.

A demonstration in a large field of celery on the control of celery blight showed a 95 per cent increase in the crop treated with Bordeaux mixture, as compared with the untreated plot. Another field of celery was visited, in which the varieties were badly mixed owing to unreliable, untested seed. The loss to the grower from this seed will amount to several hundred dollars. It was recommended that the growers procure their seed one year ahead of the time of planting, test it as to variety purity, and destroy it if badly mixed.—E. E. R.

Plan for more profit

THE most important job the farmer has today is to grow his crops at the lowest cost per bushel or per pound.

The only way to do this is to secure more bushels of corn, more pounds of truck, etc., per acre and per man.

Good seed and proper tillage are necessary, but in order to secure the best yields, the best quality, and hence the most profit, the right kind of available plant food must be supplied.

Swift's Red Steer Fertilizers furnish available plant food from sources that feed the crop from seeding to maturity.

Don't figure on the increased yield alone for your profit. The better quality crops, due to the use of fertilizer, often pays the entire fertilizer bill. The better "catch" and bigger yield of clover is often worth much more than the cost of the fertilizer applied to the nurse crop.

Liberal applications insure biggest crops of best quality.

The Red Steer on the bag is a guarantee of highest quality.

Order now from the Swift dealer or from our nearest Sales Division.

(Fertilizer Works)

Baltimore, Md.

Cleveland, Ohio

Get the most for your money

Experiment stations urge the use of high analysis fertilizers, because such fertilizers furnish plant food to the farmer at the lowest cost per pound.

Your cost of producing a crop and our cost of manufacturing a fertilizer are comparable. You have a certain fixed expense regardless of the size of the crop and we have a certain fixed expense regardless of the analysis of the fertilizer. When we increase the amount of plant food in a ton of fertilizer the extra plant food is free of expense for bags, freight and labor and you get the advantage of our saving.

Buy Swift's Red Steer Fertilizers containing 14% or more of plant food and thus secure high grade plant food at the lowest cost.

Of Interest to Farm Women and Girls

Why Not Use More Graham Flour?

GRAHAM flour is not used in most people's everyday cooking nearly so much as it deserves to be. Practically every one who comes to our house seems fond of it, particularly our guests from the city. It can be served in such a variety of appetizing ways. I shall give further information on some of the favorite ways in our family.

Those not accustomed to its use should understand that there is a difference between graham and whole wheat flour. Graham is the wheat ground into flour with nothing removed, but whole wheat flour as sold on the market today has had the coarser flakes of bran sifted out. Both flours can be used interchangeably in all the following recipes, but constant use of them for years has proven to us that graham is preferable, especially when used as a breakfast mush. It has a lighter, more flaky appearance and does not lump so easily as the whole wheat flour. (Editor's Note.—And since there are more vitamins, which our systems need to keep our vitality up to prime, in the bran of cereals, it stands to reason that the bran of the graham flour is very desirable in the diet for this reason, as well as to produce bulk in the food to maintain good intestinal action).

Both flours can be purchased at any good grocery or bakery store in our section. One manufacturer makes a specialty of graham from spring wheat flour, but we have had better satisfaction in the use of graham made from our own winter wheat, which we get ground at our local grist mill. Be careful that your wheat is free from cockle, else when the wheat is ground those black hulls of the cockle will show prominently.

Perhaps the most popular way of using graham is in brown bread.

Good Brown Bread

Make a sponge of white flour as for white bread, and stiffen with graham instead of white flour, making the dough a little softer than for white bread. Bake thoroughly for 1½ hours; this is none too long for an ordinary-sized loaf. Rub a little butter over the top of the loaves when you remove them from the oven, and cool before putting away. This bread should keep a week in good condition (if you do not eat it before then), especially if mashed potato is used in the sponge. It should be soft and crumbly in texture, and will be medium light in color if part white flour is used in the making of the dough.

Breakfast Graham Mush

As a breakfast food graham flour is the cheapest material on the market, and graham mush is not only delicious but is quickly and easily made. Stir the dry flour slowly into boiling salted water, and cook in a double boiler for an hour and a half or in the fireless cooker over night. It should be a smooth mush, and not too thick. Serve with cream and sugar—brown sugar occasionally. When cold it makes an enjoyable dessert for supper.

Graham Cookies

These are enjoyed by both chil-

dren and grown-ups. They will keep for a good while in a tight box or crock. We depend on them for a constant standby to be used as cake, dessert, afternoon refreshments or impromptu lunches.

Ingredients.—One quart graham flour, 1 egg, 6 tablespoons sugar, ½ teaspoon salt, 3 tablespoons butter, 2½ teaspoons baking powder, cinnamon and nutmeg for flavoring, and milk enough to make a soft dough.

Method.—Sift together the flour, spices, sugar and salt and baking powder, and rub in the butter. Beat up the egg, and add with the milk, mixing them in lightly. Roll out, sprinkle with granulated sugar and roll out again. Cut out and bake in a hot oven for 10 minutes. They must be thoroughly baked, for it is the browned and thoroughly done graham flour that gives them the extra good flavor.

Graham Muffins

Ingredients.—One pint graham flour, 1 pint white flour, a scant ½ cup of melted lard, ½ teaspoon salt, 1 tablespoon sugar, 3 eggs, 1 pint milk, 3 tablespoons baking powder.

Mix well and bake in a hot oven until well browned.

Graham Griddle Cakes

Beat 1 egg, mix with 1 cup milk, add 1 cup graham flour in which you have sifted 1 teaspoon sugar and ½ teaspoon salt and 1 teaspoon baking powder.

Steamed Graham Pudding

Rub ½ cup butter into 1½ cups of graham flour, into which you have sifted ½ teaspoon soda and ½ teaspoon salt. Add 1 egg, ½ cup molasses and ½ cup milk, and then add raisins, dates, dried or candied pears or cherries to the batter, and steam in a buttered mold or in cups for 2½ hours. Serve with cream and honey.

Graham Apple Pudding

Butter a baking dish, slice in some apples and sprinkle with sugar and cinnamon. Make a batter of ½ cup sugar, butter the size of a medium egg, ½ cup milk, 1 egg, graham flour enough to stiffen to ordinary cake consistency, with 1 teaspoon baking powder sifted into the flour. Season with 1 teaspoon vanilla. Pour this batter over the apples and bake in a moderate oven until cake is done and appears soft.

These recipes are similar to those in which white flour would be used, except that with graham one has to use a little more moisture.—Elinor S. Brinton, Chester Co., Pa.

KEEPING CHILDREN BUSY

I am a reader of the Pennsylvania Farmer, and am very much interested in the Household Page, especially what mothers write. I am a mother of three children, the oldest a school boy of eight years, the next a girl who will be five in April, and a 16-month-old baby boy. So I have many problems to solve as have all mothers.

I will give a few ways how I interest my little ones. The school boy and the little girl can both draw well so I see to it that I am not too

busy to praise them when they show me what they draw which makes them more interested and they spend many hours drawing and coloring. Not all children are good at drawing, but if mothers will take a little time and draw something and tell them to try and make it as near like the one you made as they can. Give them a pencil and paper and let them try it. It will take a little time to get them interested but it will pay, and it will teach them to write nicely, can write well.

When you tear a page from a calendar, give it to the little ones, they will always be glad for it. They can draw on it and learn the numbers also. An old catalog will interest them if you let them color the pictures. Take a little time to show them how some of the pictures might be colored and tell them to try and not get over the lines. After they have been at it a while they can do it real well, then praise them for it. If there are several small children, get them to see which one can draw the best, and they will all try hard. Sometimes my little girl gets a notion she cannot draw some of the pictures in her drawing book, then I say to her: "Oh, yes you can, try it once, make it as good as you can." Then she will try, and when she has it finished she shows it to me and says, "Mamma, look I made it." Then I tell her she can do it if she tries.

My baby does not walk alone yet, if he is on the floor he crawls and that makes him so dirty but the cold floor is what worries me most, so I have him on the rocking chair or couch most of the time and give him a book to look at the pictures. I taught him to turn the pages and look at the pictures, telling him not to tear it, and he looks at it long before he begins to tear it. When he begins to tear it the little girl gives him a doll or some other plaything for a change.—Mrs. I. B. W., Lanc. Co., Pa.

MADE WITH SOUR MILK

In our home cooking we use sour cream to make many delicious things. In fact, if I should have to live in the city I would be lost without it. She is a most careless cook who fails in recipes that call for cream that has "turned," for every one of the recipes below are easily made and turn out tasty and good.

Even ice-cream, delicious and sweet, can be made from sour cream if a scant teaspoon of soda is added to each pint of cream, and then the ice cream is made as usual.

Virginia Cookies

Two cups sugar, 2 eggs, ½ cup butter and lard mixed, ½ teaspoon soda stirred into the cream, 1 level teaspoon ground mace, and flour enough to roll out. Sprinkle the top with granulated sugar before cutting cookies.

Sugar Cakes

One pound white sugar, 3 eggs, 6 ounces butter, 1 teaspoon soda dissolved in 1 cup sour cream, and flour enough to make a soft dough. Flavor to taste. Add granulated sugar to rolled dough before cutting out.

Salad Dressing

Two eggs, 1 tablespoon butter, one tablespoon flour, 1 teaspoon each of salt and mustard, 2 tablespoons sugar, ½ cup vinegar and 1 cup sour cream.

Cream the flour and butter together, mix into this all the dry ingredients. Tip the pan to one side and

Better Home Heating at Less Cost

There is no reason why your house should not be as warm and comfortable as hundreds of others. Their owners have found that with less fuel than their stoves were burning, they could keep every room at a uniform temperature.

Now, instead of over-heated sitting or dining rooms and cold bedrooms and halls, all doors can be left open and in every room there is pleasant warmth.

You, too, can change to such warm comfort in a day and save many dollars yearly on your coal bill. A New Idea Pipeless Furnace will do this for you. Our money-back written guarantee protects you absolutely. A New Idea costs little more than a good stove, for lower prices again prevail.

Ask the New Idea dealer near you to explain the many advantages of the New Idea Furnace. If you don't know him, write us, and we will send his name. Expert heating advice free to you.

UTICA HEATING COMPANY
Box No. 80, UTICA, N. Y.

Also manufacturers of "Superior" Pipe Furnaces and "Imperial" Steam and Hot Water Boilers.

NEW-IDEA Pipeless Furnace

"The one you've heard so much about"

S. Augstein & Co.
352 Fourth Avenue New York City

beat the eggs until the yolks are well mixed with the whites, then stir them into the rest of the mixture. Add the vinegar, place on stove and stir all the time until the dressing is thick. When cold stir in 1 scant cup of sour cream.

Feather Cake

One cup rather thick sour cream, 1 cup sugar, 2 cups sifted flour, 1 egg, 1 teaspoon salt, 1 level teaspoon soda dissolved in a little water, 1 teaspoon vanilla, 1 teaspoon baking powder.

Plain Fruit Cake

One cup sour cream, 1 cup brown sugar, 1 cup molasses, 3 cups flour, 1 cup raisins, 1 cup chopped walnuts, spice to taste, 1 teaspoon soda in 1 tablespoon hot water, 1 teaspoon salt and 1 egg.

Quick Cream Cookies

One cup sour cream, 1 cup sugar, 1 egg, 2 1/2 cups flour, 1 level teaspoon each of soda and salt; flavor. Drop with teaspoon on well-buttered tins. pat down and sprinkle sugar on each. Also put one-half nut meat on each.

Gingerbread

Three-fourth cup of thick sour cream, 1/2 cup molasses, 1/2 cup sugar, 2 cups flour, 2 eggs, 1 rounding teaspoon soda, 1 tablespoon ginger, 1 teaspoon each of cinnamon and lemon extract, and 1/2 teaspoon salt. Bake in gem pans, and frost with confectioner's sugar frosting.

Cream Biscuits

One quart flour with 1 teaspoon each of salt, soda and baking powder sifted in well; then add 2 large tablespoons thick sour cream to the milk used in wetting; mix, handle lightly and bake in hot oven.

Sour Cream Pie

One cup sour cream, 2 cups sweet milk, 1 cup sugar, 1/2 cup chopped raisins, 1 1/2 tablespoons vinegar, 1 tablespoon flour, 1 teaspoon cinnamon, yolks of 2 eggs and a little salt. Bake in one crust. Use the whites for a meringue, sweetened with 4 tablespoons sugar; brown in oven.

Deviled Eggs

Boil 6 eggs hard, cut in halves lengthwise, remove the yolks and mash with a fork, adding enough thick sour cream to moisten. Add mixed mustard, salt and a little red pepper. If the cream is too sweet, add a dash of lemon juice. Put the powdered yolks thus seasoned back into the whites.

Cream Horseradish Sauce

Beat 1/2 cup thick sour cream, add a little salt and sugar, and beat in 1/2 cup grated horseradish. Serve with cold ham.

Layer Nut Cake

One-half cup rich sour cream, 1 cup sugar, 2 cups flour (measured before sifting), 2 eggs, 1/2 teaspoon each of salt and soda, one teaspoon baking powder; flavor with vanilla. Bake in three layers. Use nut filling.

Johnnycake

One tablespoon butter, 2 tablespoons sugar, 1/2 teaspoon salt, 1 egg, 1 cup sour cream, 1 cup cornmeal, 1 cup flour, 1 teaspoon of soda.—Mrs. Elizabeth O. Jean, Baltimore Co., Md.

Possibly not enough vegetables in the diet. The children should eat them too.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3095.—Cape and Muff.—There will be many raw days yet this season when such a set will be appreciated. The pattern comprises a muff cut in one size, and a cape cut in 3 sizes: Small, 32-34; medium, 36-38; and large, 40-42 inches bust measure. Fur, plush, velvet or corduroy are good materials. Fur and velvet or satin may be combined. The collar may be rolled high or low. To make the cape for a medium size will require 2 1/2 yards of 44-inch material. The muff requires 1/2 yard of 30-inch material for the outside and 1 1/2 yard for all inside sections and stays. Pattern, 10 cents.

3234.—Play Apron.—The pattern comes in 5 sizes, 1, 2, 3, 4 and 5 years. A 4-year size will require 1 1/2 yard of 36-inch material. As illustrated, the apron is made of white cambric, with stitching in red cotton. The pockets are "cut out motifs," finished and applied to the apron with stitching; the upper edge is left free to form the pocket opening. Pattern costs 10 cents.

3397.—Isn't It Pretty?—This design is suitable for slender women and misses. The pattern is cut in 3 sizes: 16, 18 and 20 years. A 16-year size will require 5 1/2 yards of 40-inch material. Bordered serge, and other wools, plaid and check suitings, tricotine and gabardine are attractive for this style. The width of the skirt at lower edge is 1 1/2 yard. Pattern, 10 cents.

3487.—Girl's "Gym" Suit.—This suit makes not only a good garment for gymnasium practice but is good for the foundation of a bloomer suit. The pattern comes in 5 sizes: 6, 8, 10, 12 and 14 years. A 10-year size will require 3 1/2 yards of 44-inch material. Serge, repp, poplin, gabardine, saten and jersey cloth are good materials for this style. Pattern, 10 cents.

A Health Hint

When the wind blows so hard that it seems impossible to put the bedroom window up, wrap a window screen in a cotton cloth and use it to keep out the draft, but not the air. Better still, cover a screen with cheesecloth and have it always ready to use.

The "U. S." Bootee

The protection of a boot—the comfort of a shoe

A miner's rubber shoe that is becoming popular among farmers everywhere

IN wet weather—over muddy ground—you can keep your feet as dry as in boots, and yet have all the light-weight comfort of a shoe.

Farmers everywhere are buying the new U. S. Bootee—a water-tight rubber shoe that is just the thing for everyday service around the farm.

It was first designed for miners, who must have a waterproof shoe that will not tire their feet. Today it's fast becoming popular all over the country—with all men who have to work much out-of-doors. Worn right over the sock like a leather shoe, the U. S. Bootee gives perfect protection always—whatever job you have to do. Its light weight and its smooth, easy fit will give you a new idea of real comfort in rubber footwear.

Ask your dealer to show you a pair of the new U. S. Bootees. Note their smooth rubber surface—feel how pliable and comfortable they are. They have the same built-to-wear construction which character-

izes the whole U. S. line of rubber footwear.

Other types of "U. S." Footwear—built for rough service

The U. S. line of footwear has a type for every need—arctics, rubbers, "overs"—all built in the same, rugged, reliable way.

They all have tough, heavy soles—special reinforcements at every point where the wear is hardest—and the highest quality rubber from our own plantations.

Ask your dealer to show you his U. S. line. Pick out the models best suited to the work you do. Every one has been designed by experts—every one is backed by over half a century of experience.

Always look for the "U. S." Seal—it means solid wear and long service for your money.

"U. S." Boots—Reinforced where the wear is hardest. Made in all sizes and styles—Hip, Half-hip, and Knee. In red, black, and white.

United States Rubber Company

Feed F. P. C. Chick Manna First

It takes the place of the bugs, seed, worms and grit that the mother bird instinctively scratches. It contains the same natural elements that cause baby chicks, turkeys and pheasants to thrive and grow.

It is specially prepared to carry the chicks over the first ten days. F. P. C. Chick Manna will avoid bowel disorders that are caused by feeding coarse grains or sticky mixtures that soon ruin the chick's delicate digestive system.

F. P. C. has proven itself dependable year after year since 1884. Get it from your dealer or write to us. Satisfaction guaranteed or money refunded. Information on prevention of poultry losses sent free on request.

F. P. CASSELL'S SON Box 503, Lansdale, Pa.

POULTRY

Comfortable Flocks Pay Best

THE laying hen is a creature of habit, and anything which disturbs her everyday life has a bad effect on the egg yield. The other day a neighbor came to see my flock and to talk over poultry matters. He was accompanied by his dog, and the latter succeeded in making his way into the poultry pens along with us. Instantly the hens were aroused and dropped their everyday duties to scold and chatter about the intruder. It may seem like a very little thing to my neighbor—but there was a dropping off in egg production in the pens we visited that became noticeable for a few days.

I never allow dogs to enter my poultry yard and take all possible precautions to keep the hens from getting excited. A quiet, peaceful existence for the hens has its results in the egg yield. It pays to keep the flock gentle and comfortable at all times, particularly when a maximum yield of eggs is desired.

The laying houses are cheerful as they can be made with a minimum of sunshine. It is during this part of the year that the effect of climatic conditions is particularly noticeable on the layers after several months' confinement in winter quarters. Thus far we have had a very open winter for Berks County, although the sunny days have been few. I try to arrange my winter quarters for the hens so that the greatest possible amount of sunshine can enter during the short days of the year.

It is at this time that sunshine acts as a tonic to the hens. They like to stand around in it when they are not busy at the feeding trough or the scratch feed. Sunshine will keep the litter dry, an essential to good health when the flock is in winter quarters.

Watch the litter at all times. If a busy hen can bury herself in nice, clean straw and find there sweet and wholesome grains, and when she looks up the sun and light warm her, it will not be long before she will begin to lay, and keep on laying. Any tendency to dampness on the floor should be checked at once, for the hen spends most of her time during the day there. A few wood shavings scattered among the straw will make the litter dryer.

I use a good whitewash on the interior of the hens' quarters once or twice each winter, depending upon the time I have and the severity of the winter. I make the whitewash at home by using five parts of cream of lime. By cream of lime is meant fresh stone lime slaked with boiling water and diluted to the consistency of thick cream. I add one part of kerosene and one-half part of some good disinfectant, then dilute the mixture to the consistency desired. A tablespoonful of washing blue is added to give it a white appearance, and glue may be added to aid in sticking.

One of the little things which many farmers neglect in the winter is the water supply. Few farmers appear to know that an egg is about 60 per cent water, or if they do know, seem to think the hen is something like a camel and can secrete its water supply somewhere about her body. I have carried water for a flock of thirsty hens until I have come to the conclusion that an egg must be 99 per cent water. Clean, fresh water must be before the birds at all times. When filling I always pour out the old water, wash the pan, and fill with clean, sparkling water. I would not be afraid to drink myself. Stale water is filthy and liable to become contaminated. I have known of disease to lurk in the water fountains and pans.

Keeping the hens busy, comfortable and contented will go a great ways toward solving the problem of getting eggs in midwinter.—A. J. Bradley, Berks Co., Pa.

FEBRUARY POULTRY ITEMS

Vigor is the foundation of success with poultry. If the breeding cockerels have not come thru the winter in good condition it will pay to look around and make a last minute effort to pick up some good ones. The extra money spent for the birds will more than be returned in the increased value of the chicks.

Remember that incubators have been known to start fires. Inspect the machine thoroly before starting and see if the flues have become clogged with dust. One fire was caused by a mouse building a nest of rubbish in the hot air flue. Fortunately it was located in time. A careful adjustment of the lamp is the best prevention of overheating. Have the thermostat regulated so that the lamp does not have to burn its hottest to keep the egg chamber up to 103 degrees.

The early hatches take time and work but we find that the best hens aer laying before the fine days of spring and we wish to incubate as many as possible of their eggs. Later in the spring many of the best hens wish to set. The early chicks have more of the fine spring days in which to accumulate growth. Spring conditions with the tender green growth and worms and newly hatched bugs is conducive to the rapid development of bird life. It is necessary to start the incubator early in order to take advantage of such conditions.

We find from experience that the early hatched birds are worth starting as a cash proposition. The broilers bring more money in the season. The breeding cockerels are ready for sale early in the season. The breeding cockerels are ready for sale early in the season. The breeding cockerels are ready for sale early in the season.

Bred-to-lay strains are becoming more popular on the farm as farmers find by experience that such birds do prove the best layers. Years ago it was only the fancier that had a chance to sell hatching eggs at high prices. Now the breeders of bred-to-lay stock are finding a large demand for their surplus hatching eggs. They may not get as much per set-

ling as some breeders do for prize winners but they do get a large number of orders. The number of settings that can be sold is just as important as the price per setting.

The best bred-to-lay flocks are now good looking birds which are quite true to type. It is not necessary to guess at the breed of a good bred-to-lay hen. Of course the finest prize winners may not be the best layers. But the best layers are often good appearing birds that make an attractive appearance on any farm. We believe it is possible to develop fine bred-to-lay flocks without breeding from a single bird that is not of a good type for the breed she represents.

A fenced range for the poultry helps to make the business more pleasant. It keeps the hens away from the house and the flower beds. They do not roost in the barn or tool shed. They are not killed in the road by automobiles. The fenced range can often consist of a few acres of orchard which is in sod. We find that red raspberries form a shady protection on part of the poultry range. The canes make a cool shade and the foliage protects the berries so that not many will be taken if the hens have plenty of a balanced ration.

We believe it pays to keep the dust box in an outside scratching shed if possible or place it near the window and keep it closed except on sunny days. If some of the hens are always kicking and fanning the air full of dust it seems to make the conditions in the laying houses rather unhealthy. If hens are treated for lice with blue ointment we find that they do not need to be constantly dusting in order to keep healthful and free from lice. Of course that only refers to winter conditions in the house when the hens are constantly confined. At other seasons they will take all the dust baths they need outside and it will be good for them.

Second hand incubators can often be purchased at low prices from reliable parties. Buy standard machines that are still made so you can obtain a repair list from the makers. Then inspect the machines thoroly for leaks. Give the thermostat a careful examination and compare the thermometer with an instrument of known accuracy. Do not buy a warped machine that is ready for the junk pile but you can often save money on a second hand machine which has proven a good hatcher in the hands of a breeder you know. Such machines are often sold by men who are buying outfits of larger hatching capacity. They only sell the smaller units because they need larger ones, not because the smaller machines are without value.

Now is the time to study nursery catalogues and plan on ordering a few fruit trees for the poultry yards. We have observed that pears and plums seem to do the best for shade in poultry yards. They grow rapidly but do not take too much room and they will thrive in soil. Peaches need cultivation and apples grow too slowly and finally become too large. Of course an apple orchard is fine on a large poultry range although not so good in small yards.

Plant the trees far enough from the poultry houses so that the houses will not be drenched with spray when the trees are covered with spray done.—R. G. Kirby.

Why Case Tractor Bull Gears Resist Wear and Breakage

CASE Tractor Bull Gears are made from high carbon steel billets, forged into one-piece, weldless rings. The method of manufacture—Case patented—is such that only steel absolutely free from flaws and defects can withstand, successfully, this process. If there is going to be any breakage, it occurs in the factory, before the gear is completed—not after it is on the tractor and the machine working in the field.

Hydraulic forging, annealing, heat treating, tempering in an oil bath, machining and cutting teeth to the accuracy of less than the thickness of a human hair—each of these important steps in the process of manufacturing Case Tractor Bull Gears contributes materially to the true-running qualities, smooth operation, and long life of Case Kerosene Tractors.

The wear-resisting hardness, breakage-defying toughness, and permanently perfect mesh of Case Bull Gears, are features characteristic of Case manufacturing thoroughness in all details.

Action or Reaction

A private soldier, mustered out at the close of the Civil War, became in turn a farm hand, a tenant, a farmer of his own land, a recognized authority on farm management and farm markets, and finally Governor of a great state in the Central West. He followed always one fixed principle. He held that the time to expand activities in any direction was when others were beginning to reduce or abandon their interest in that line. He began when others quit.

As long as he lived he put his theory to the test on his own farms and his remarkable success proved its correctness.

Today many farmers are uneasy and are said to be considering giving up the use of commercial fertilizers.

For five years conditions beyond their control have brought about high fertilizer prices and made it necessary to accept fertilizers radically different in composition from those formerly in use.

Is the solution of the trouble to be found in giving up the use of things that have proved profitable in the past or in a careful consideration of the question of the purchase of fertilizers that will be as good as, or better than those formerly used?

There has been a period of Potash Starvation. Now all fertilizer materials are obtainable. Fertilizers high in Potash, 5 to 10 per cent, can be made and if you will insist on buying them you will find that

If you want to get your springers to market early or if you want to develop early layers you must feed your young chicks *Ubiko* with properly balanced, easily digested, nourishing food. *Ubiko* Buttermilk Growing Mash contains everything needed by the young chick for rapid and healthy growth. It builds big frames and develops feathers quickly. It is made of meat meal, bone meal, corn meal, wheat bran and middlings, ground oats, ground barley, linseed meal and dried buttermilk.

It analyzes 15% protein, 3% fat, 6% fibre, 10% ash. Note carefully 5 important things about this ration: (1) Protein is of the right kind, mainly from meat and milk. (2) Fibre very low insuring highest digestibility. (3) Buttermilk added to aid digestion and prevent disease. (4) Ash is phosphate of lime from sterilized bone meal. (5) Great variety of ingredients, very palatable.

Get a supply of *Ubiko* Buttermilk Growing Mash today and insure the health of your chicks. Time is money. Save time in the development of your chicks and you will make money.

New York Horticultural Meeting

THE sixty-sixth annual meeting of the New York State Horticultural Society, held at Exposition Park, Rochester, showed that the society which a few months ago gave symptoms of disintegration, is still a strong, virile organization with a large and active membership and a goodly balance in the treasury. The past season was one to try the temper of both large and small growers and few men connected with the industry ever saw such a general merging of menacing conditions which seemingly hit the industry from every angle conceivable.

However, the Rochester show carried a high note of optimism and more confident than ever are the growers that with a return of sane conditions fruit growing will again take its place as the leading interest of farmers in the great fruit belt of the state.

The attendance ranked well with other years while the exhibits of machinery, equipment and fruit was greater than that ever shown before under auspices of the society.

One of the pivots of interest came up in the report of E. H. Anderson, of Rochester, chairman of the transportation committee. The matter of adequate transportation has likely caused more dissatisfaction and annoyance to the growers than any other one thing outside of the low price of fruit during the past season. The car shortage has been a real thorn in the flesh. In part Mr. Anderson's report reads:

"We believe all will agree with us when we say that agriculture and transportation are the two fundamental industries of the country and that they are interdependent. One cannot thrive without the other; therefore, increased production means increased tonnage and increased tonnage means improved transportation service. We believe that much can be done to develop automobile trucks for hauling freight short distances, but the bulk of the perishables produced in New York state must depend upon railroad transportation to reach the markets."

One of the new phases of association work this year was announced in the arrangements made with a large chemical company thru the Grange-League-Federation Exchange, whereby from thirty to forty carloads of lime-sulphur will be available to the growers in their fight on insects and plant diseases. This spraying material will be handled thru local branches at a price which will be announced in a short time.

While the machinery obtained more space than ever in the exhibit this year, the fruit exhibit was about the same as last year, except that the fruit was of much better quality. Between 50 and 75 varieties of choice boxed apples formed a vast color scheme of red, green and yellow, along one side of the wall in the building given over to fruit displays. Among them were Sweet Winesaps, Holland Winters, Esopus, Greenings, Romes, Enscos, Crow Eggs, Jonathans and Black Gilliflowers, an old variety.

The exhibit of the State Experiment Station at Geneva, always a point of great interest, was exceptionally so this year. Here were a number of hybrid apples: The Westchester, a cross between the Ben Davis and the Green Newtown; the Cortland, believed to be the most successful cross, a Ben Davis and McIntosh, which gives it most of the

McIntosh qualities added to the Ben Davis-keeping qualities.

While New York's apple crop in 1920 was nearly four times as large as the year before, the financial return to the grower was only one-fourth greater, the value of the crop being \$41,727,500 which was only \$8,000,000 more than last year, but the size of the crop was 38,850,000 bushels greater than the year before.

According to report, the total crop in New York state in 1920 amounted to 55,650,000 bushels, which was more than 23 per cent of the total apple yield of the United States and exceeded the total yield of all the states west of the Mississippi river by 5,100,000 bushels. This excess was greater than the total yield of all the New England states except Maine. In taking up the money side of the crop, President Wellman said:

"The average city person thinks that the growers of food products are profiteering and getting rich at the expense of the city consumer. Here are some figures on the cost of producing apples during 1920 as compiled by the State College of Agriculture thru the Farm Bureau: The cost of producing apples was about \$3.70 per barrel for Western New York and \$4 for the Hudson Valley. The grower who could not sell at a profit last fall and stored his apples, and was obliged to sell today could realize about \$3 per barrel—besides the storage. The loss the average grower would have to face on the present market would be about \$1 per barrel."

National Grange Master, Sherman J. Lowell, of Fredonia, was one of the last speakers, appearing in the place of Dr. W. H. Jordan, of the Geneva Experiment Station, who could not come for his appointment. Master Lowell said in part:

"I want to sound a note of warning. We are going mighty fast. Our organization work is splendid but I sometimes imagine that we expect too much of just mere organization. After the Civil War, 11,000 grange locals sprang up in just a few months. It was the idea that the movement was a panacea for all ills. Such organizations can spring into life in a day and they can die in half that time. In connection with this movement we must have deliberation and calm judgment. We must be fundamentally right and show reasonable wisdom in our constructive work. If we do not, twenty years will see peasant farming in the United States with all that it means to this country, which in a very essential way has been grounded and rooted in its stable farming class."

"I am impressed at this time with the thought that we are under immediate necessity of making an important decision. Are the great organizations of farms to be commodity organizations or are they to be general in their nature? Said in another way, are we separated by specific interest like wheat growers and apple growers to organize without reference to other agriculturists and press our claims, or are we to recognize our common need and that our success is dependent on moving in solidarity?"

Officers were elected for the ensuing year as follows: President, T. E. Cross, LaGrange; first vice-president, J. B. Pease, Gasport; second vice-president, P. W. Cornwall, Pultneyville; secretary-treasurer, Roy E. McPherson, LeRoy.

RUST'S CLIMAX Condition Powder

Hens Need Conditioning in the Spring

Laying time is here. Hens need a tonic. Start feeding Rust's Climax Condition Powder and have healthy, happy laying hens. Feed it to the little chicks. It helps to keep them free from gapes and diarrhoea. Develops plumage, vigor—improves their appetites. It enables spring hatched chickens to develop into profitable laying pullets by fall—makes fat broilers early in the season.

If your dealer cannot supply you, send us his name and 36c. for a trial package.

DAY OLD CHICKS

HOMESTEAD FARMS
It will pay you in selecting chicks for the coming season to consider the quality of our Pure Breed Practical Poultry. We will send you our new Spring Catalog, which explains this breeding. FARM PRODUCTS SHOW

A Farm Product Show and meeting was held in the Community Building at Dimock, Susquehanna County, Pa., Thursday, Jan. 13. Although this was the first show of the kind to be held in this place, it will be an annual event hereafter. It was put on by the community and no products were exhibited except those raised in Dimock township.

There was a large attendance of women and men who were greatly interested in the new enterprise. Some exhibitors displayed as many as eight different products. There was a goodly showing of all kinds of farm grains, corn in the sheaf, broom corn, vegetables, fruits, nuts, honey, canned fruits, jellies, marmalades, and some bake stuff.

Mr. E. D. Roderick, of Dimock, was the chairman of the afternoon session and ably filled that position. The judges were J. B. R. Dickey, extension specialist in soils, fertilizers and lime, of the Penna. State College, and John From, vocational teacher of Harvard, a graduate of the State College. These men gave very interesting talks on the grains, vegetables and fruits.

These experts demonstrated how farmers should arrange their exhibits attractively, how to pick out uniform ears when showing corn, always breaking off the shank at the usual breaking point instead of cutting them off with a knife, as the appearance is much more natural and neat. The butts of the ear should not be too large.

The fact was emphasized that no vegetables or grain should be chosen for exhibition purposes unless they were good for seed; not too large nor too small, medium size always being preferred.

Miss Trittthill, domestic science teacher of Dimock High School, gave an instructive talk on canned goods, and bake stuffs.

Prof. J. A. Martin, agricultural teacher in the same school, explained how the community originated the idea of holding the farm products show, also how to improve and make it more interesting next year. During the forenoon, Prof. Martin tested milk for the dairymen of the place who cared to have a test made, thereby showing some of them some startling results. There are nearly a hundred patrons of the Dimock milk station and this test was greatly appreciated by many of them.

C. P. Fague, Farm Bureau agent of Susquehanna County, was the last speaker of the day. He announced that a livestock show, consisting of various educational features would be held in Dimock during the coming summer, and plans are already being made to insure the success of this undertaking.—E. M. L. R.

PERFECT POISE

Once, in that elect area known as Boston, there lived a famous artist with a charming but absent-minded wife. One summer, when the family was at a mountain hotel, the father went off painting. The mother and the children went to their rooms for the afternoon nap. Shortly, the mother came timidly downstairs, and asked if she might have a pill carried up, the clerk became disturbed. "Dear madam," he said, "is there anything wrong?"

"Well, nothing," she answered, "but—" and she looked a little distressed—"but my room is on fire."

Hoffman's Farm Seeds

ness and soundness of growth. American-grown seed—new crop. Real guarantee. Hoffman's Clovers will please you no matter how critical you are as to quality. Samples free. Read full specifications in catalog.

Seed Oats 6 kinds—one a special 'side' or 'horse-mane' variety. True to name—certified by growers and State Inspectors to be 99 1/2 % pure side oats. Yields enormously—catalog shows photo of large field that produced over 100 bu. to the acre. Grows beautiful, long head. Long, stiff straw—withstanding storm remarkably. Grain is pretty nearly all kernel—hull extremely thin—variety of greatest feeding value. Get the catalog and read more about this 'Improved Side Oats.' Other sorts offered include famous 'Shadeland Climax' from Oregon—splendid variety for use here in the East—yields heavily—grain as beautiful as any you ever saw. Other varieties are dependable croppers—ask us for samples and read full descriptions in catalog.

Seed Corn 8 distinct varieties—white—yellow—white cap—early—late—kinds for silage as well as husking. All of nearly perfect germination. Variety pictured below growing into favor faster than any other corn in Pennsylvania—wonderful producer. Endorsed by many County Farm Bureaus and Federal authorities. You should learn more about these corns through our catalog and by actual trial of the seed. Results are bound to please you.

Seed for Every Farm Crop Potatoes from Maine. Barley, Spring Wheat, Speltz, Buckwheat. Pasture Grasses, also special permanent mixture that produces a lasting pasture. Soy Beans—Field Peas—all seeds of sound quality. Catalog gives full instructions for crops you are not already acquainted with.

Catalog Free
Write for this book—its different from other catalogs—describes field seeds only. Hardest types—reliable yielders—selected by practical farmers knowing seed needs of other farmers. Gives valuable pointers. Every bag of seed it offers is clean—sound—tested—must please you! Read guarantee below. Hoffman's Seeds will pay you!

Prices Lower

This will permit heavier seeding—changing varieties—and renewing seed of certain strains you already have.

Clover Seed Highest quality—all varieties—Alsike—Red—Mammoth—Sweet—Crimson—White—Alfalfa. Very highest grades market affords. Unsurpassed for cleanliness and soundness of growth. American-grown seed—new crop. Real guarantee. Hoffman's Clovers will please you no matter how critical you are as to quality. Samples free. Read full specifications in catalog.

Alfalfa Seed Special Northwestern seed—grown in far northwest corner of country. Tests 99 1/2 % pure—sound germination—free from weeds. Very hardiest strain—insures successful stands. Catalog offers two other kinds, and gives complete details for starting Alfalfa. Ask for samples.

Ears of "Lancaster County Sure Crop" Corn. A Wonderful variety suited alike for silage and husking. Profitable Yielder.

SYNOPSIS

Dan Failing had just received from his physician the unwelcome information that he had but six months to live. Altho descended from a long line of hardy pioneers, his life had been spent in the city where confinement in an office had destroyed the physical foundation which his forefathers had laid. He strolled out to the city park, sat on a bench where he made the acquaintance of a squirrel. The squirrel's antics awoke a latent love and appreciation for the things of Nature and he suddenly resolved to spend his last six months in the forests of the Northwest where his grandfather had lived. He acts at once upon this resolve and he is seen in the virgin forests of that great country. He is fortunate in becoming an inmate of a home owned by a man who knew and loved Dan's grandfather. A daughter, nicknamed Snowbird, is also a member of the family.

CHAPTER VI

FOR two very good reasons, Dan didn't call to Cranston at once. The two reasons were that Cranston had a rifle and that Dan was unarmed. It might be extremely likely that Cranston would choose the most plausible and effective means of preventing an interruption of his crime, and by the same token, prevent word of the crime ever reaching the authorities. The rifle contained five cartridges, and only one was needed.

But the idea of backing out, unseen, never even occurred to Dan. The fire would have a tremendous headway before he could summon help. Although it was near the lookout station, every condition pointed to a disastrous fire. The brush was dry as tinder, not so heavy as to choke the wind, but yet tall enough to carry the flame into the tree tops. The stiff breeze up the ridge would certainly carry the flame for miles thru the parched Divide before help could come. In the meantime stock and lives and homes would be endangered, besides the irreparable loss of timber. There were many things that Dan might do, but giving up was not one of them.

After all, he did the wisest thing. He simply came out in plain sight and unconcernedly walked down the trail toward Cranston. At the same instant, the latter struck his match.

As Dan was no longer stalking, Cranston immediately heard his step. He whirled, recognized Dan, and for one long instant in which the world seemed to have time in plenty to make a complete revolution, he stood perfectly motionless. The match flared in his dark fingers, his eyes—full of singular conjecturing—rested on Dan's face. No instant of the latter's life had ever been fraught with greater peril. He understood perfectly what was going on in Cranston's mind. The fire-brand was calmly deciding whether to shoot or whether to bluff it out. One required no more moral courage than the other. It really didn't make a great deal of difference to Cranston.

He had been born in the hills, and his spirit was the spirit of the wolf—to kill when necessary, without mercy or remorse. Besides, Dan represented, in his mind, all that Cranston hated—the law, gentleness,

the great civilized world that spread below. But in spite of it, he decided that the killing was not worth the cartridge. The other course was too easy. He did not even dream that Dan had been shadowing him and had seen his intention. He would have laughed at the idea that a "ten-derfoot" could thus walk behind him, unheard. Without concern, he scattered with his foot the little heap of kindling, and slipping his pipe into his mouth, he touched the flaring match to it. It was a wholly admirable little piece of acting, and would have deceived any one who had not seen his previous preparations. The fact that the pipe was empty mattered not one way or another. Then he walked down the trail toward Dan.

Dan stopped and lighted his own pipe. It was a curious little truce. And then he leaned back against the great, gray trunk of a fallen tree.

"Well, Cranston," he said civilly. The men had met on previous occasions, and always there had been the same invisible war between them.

"How do you do, Failing," Cranston replied. No perceptions could be so blunt as to miss the premeditated insult in the tone. He didn't speak in his own tongue at all, the short guttural "Howdy" that is the greeting of the mountain men. He pronounced all the words with an exaggerated precision, an unmistakable mockery of Dan's own tone. In his accent he threw a tone of sickly sweetness, and his inference was all too plain. He was simply calling Failing a milksop and a white-liver; just as plainly as if he had used the words. The eyes of the two men met. Cranston's lips were slightly curled in an unmistakable leer. Dan's were very straight. And in one thing at least, their eyes looked just the same. The pupils of both pairs had contracted to steel points, bright in the dark gray of the irises. Cranston's looked somewhat red; and Dan's were only hard and bright.

Dan felt himself straighten; and the color mounted somewhat higher in his brown cheeks. But he did not try to avenge the insult—yet. Cranston was still fifteen feet distant, and that was too far. A man may swing a rifle within fifteen feet. The fact that they were in no way physical equals did not even occur to him. When the insult is great enough, such consideration cannot possibly matter. Cranston was hard as steel, one hundred and seventy pounds in weight. Dan did not touch one hundred and fifty, and a deadly disease had not yet entirely relinquished its hold upon him.

"I do very well, Cranston," Dan answered in the same tone. "Wouldn't you like another match? I believe your pipe has gone out."

Very little can be said for the wisdom of this remark. It was simply human—that age-old creed to answer blow for blow and insult for insult. Of course the inference was obvious—that Dan was accusing him, by innuendo, of his late attempt at arson.

Cranston glanced up quickly, and might be that his fingers itched and

tingled about the barrel of his rifle. He knew what Dan meant. He understood perfectly that Dan had guessed his purpose on the mountain side. And the curl at his lips became more pronounced.

"What a smart little boy," he scorned. "Going to be a Sherlock Holmes when he grows up." Then he half turned and the light in his eyes blazed up. He was not leering now. The mountain men are too intense to play at insult very long. Their inherent savagery comes to the surface, and they want the warmth of blood upon their fingers. The voice became guttural. "Maybe you're a spy?" he asked. "Maybe you're one of those city rats—to come up and watch us, and then run and tell the forest service. There's two things, Failing, that I want you to know."

Dan puffed at his pipe, and his eyes looked curiously bright thru the film of smoke. "I'm not interested in hearing them," he said.

"It might pay you," Cranston went on. "One of 'em is that one man's word is good as another's in a court—and it wouldn't do you any good to run down and tell tales. A man can light his pipe on the mountain side without the courts being interested. The second thing is—just that I don't think you'd find it a healthy thing to do."

"I suppose, then, that is a threat?" "It ain't just a threat," Cranston laughed harshly—a single, grim syllable that was the most terrible sound he had yet uttered. "It's a fact. Just try it, Failing. Just make one little step in that direction. You couldn't hide behind the girl's skirts then. Why, you city sissy, I'd break you to pieces in my hands!"

Few men can make a threat without a muscular accompaniment. Its very utterance releases pent-up emotions, part of which can only pour forth in muscular expression. And anger is a primitive thing, going down to the most mysterious depths of a man's nature. As Cranston spoke, his lips curled, his dark fingers clenched on his thick palm, and he half leaned forward.

Dan knocked out his pipe on the log. It was the only sound in that whole mountain realm; all the lesser sounds were stilled. The two men stood face to face, Dan tranquil, Cranston shaken by passion.

"I give you," said Dan with entire coolness, "an opportunity to take that back. Just about four seconds."

He stood very straight as he spoke, and his eyes did not waver in the least. It would not be the truth to say that his heart was not leaping like a wild thing in his breast. A dark mist was spreading like madness over his brain; but yet he was striving to keep his thoughts clear. It was hard to do, under insult. But he knew that only by craft, by cool thinking and planning could he even hope to stand against the brawny Cranston. He kept a remorseless control over his voice and face. Stealthily, without seeming to do so, he was setting his muscles for a spring.

The only answer to his words was a laugh—a roaring laugh of scorn from Cranston's dark lips. In his laughter, his intent, catlike vigilance relaxed. Dan saw a chance; feeble though it was, it was the only chance he had. And his long body leaped like a serpent thru the air.

Physical superior though he was Cranston would have repelled the attack with his rifle if he had had a chance. His blood was already at murder heat—a point always quickly reached in Cranston—and the dark, hot fumes in his brain were simply

nothing more nor less than the most poisonous, bitter hatred. No other word exists. If his class of degenerate mountain men had no other accomplishment, they could hate. All their lives they practiced the emotion: hatred of their neighbors, hatred of law, hatred of civilization all its forms. Besides, this kind of hillman habitually fought his duels with rifles. Hands were not deadly enough.

But Dan was past his guard before he had time to raise his gun. The whole attack was one of the most astounding surprises of Cranston's life. Dan's body struck his, his fists flailed, and to protect himself, Cranston was obliged to drop the rifle. They staggered, as if in some weird dance, on the trail; and their arms clapsed in a clinch.

For a long instant they stood straining, seemingly motionless. Cranston's powerful body had stood up well under the shock of Dan's leap. It was a hand-to-hand battle now. The rifle had slid down the hillside, to be caught in a clump of brush twenty feet below. Dan called on every ounce of his strength, because he knew what mercy he might expect if Cranston mastered him. The battles of the mountains were battles to the death.

They lunged back and forth, wrenching shoulders, lashing fists, teeth and feet and fingers. There were no Marquis of Queensbury rules in this battle. Again and again Dan sent home his blows; but they all seemed ineffective. By now, Cranston had completely overcome the momentary advantage the other had obtained by the power of his leap. He hurled Dan from the clinch and lashed at him with hard fists.

It is a very common thing to hear of a silent fight. But it is really a more rare occurrence than most people believe. If it true that serpents will often fight in the strangest, most eerie silence; but human beings are not serpents. They partake more of the qualities of the meat-eaters—the wolves and the felines. After the first instant, the noise of the fight aroused the whole hillside. The sound of blows was in itself notable, and besides, both of the men were howling the primordial cries of hatred and vengeance.

For two long minutes Dan fought with the strength of desperation, summoning at last all that mysterious reserve force with which all men are born. But he was playing a losing game. The malady with which he had suffered had taken too much of his vigor. Even as he struggled, it seemed to him that the vista about him, the dark pines, the colored leaves of the perennial shrubbery, the yellow path were all obscured in a strange, white mist. A great wind roared in his ears—and his heart was evidently about to shiver to pieces.

But still he fought on, not daring to yield. He could no longer parry Cranston's blows. The latter's arms went around him in one of those deadly holds that wrestlers know; and Dan struggled in vain to free himself. Cranston's face itself seemed hideous and unreal in the mist that was creeping over him. He did not recognize the curious thumping sound of Cranston's fists on his flesh. And Cranston had hurled him off his feet.

Nothing mattered further. He had fought the best he could. This cruel beast could pounce on him at will and hammer away his life. But still he struggled. Except for the constant play of his muscles, his almost unconscious effort to free himself

nothing mattered further. He had fought the best he could. This cruel beast could pounce on him at will and hammer away his life. But still he struggled. Except for the constant play of his muscles, his almost unconscious effort to free himself

nothing mattered further. He had fought the best he could. This cruel beast could pounce on him at will and hammer away his life. But still he struggled. Except for the constant play of his muscles, his almost unconscious effort to free himself

that kept one of Cranston's arms busy holding him down, that fight on the mountain might have come to a sudden end. Human bodies can stand a terrific punishment; but Dan's was weakened from the ravages of his disease. Besides, Cranston would soon have both hands and both feet free for the work, and when these four terrible weapons are used at once, the issue—soon or late—can never be in doubt.

But even now, consciousness still lingered. Dan could hear his enemy's curses—and far up the trail, he heard another, stranger sound. It was that second of acute sensibilities that usually precedes unconsciousness, and he heard it very plainly. It sounded like some one running.

And then he dimly knew that Cranston was climbing from his body. Voices were speaking—quick, commanding voices just over him. Above Cranston's savage curses another voice rang clear, and to Dan's ears, glorious beyond all human utterance.

He opened his tortured eyes. The mists lifted from in front of them, and the whole drama was revealed. It had not been sudden-mercy that had driven Cranston from his body, just when his victim's falling unconsciousness would have put him completely in his power. Rather it was something black and ominous that even now was pointed squarely at Cranston's breast.

None too soon, a ranger of the hill had heard the sounds of the struggle, and had left the trysting place at the spring to come to Dan's aid. It was Snowbird, very pale but wholly self-sufficient and determined and intent. Her pistol was quite cocked and ready.

Dan Failing was really not badly hurt. The quick, lashing blows had not done more than severely bruise the flesh of his face, and the mists of unconsciousness that had been falling over him were more nearly the result of his own tremendous physical exertion. Now these mists were rising.

"Go—go away," the girl was commanding. "I think you've killed him."

Dan opened his eyes to find her kneeling close beside him, but still covering Cranston with her pistol. Her hand was resting on his bruised cheek. He couldn't have believed that a human face could be as white, while life still remained, as hers was then. All the lovely tints that had been such a delight to him, the play of soft reds and browns, had faded as an afterglow fades on the snow.

Dan's glance moved with hers to Cranston. He was standing easily at a distance of a dozen feet; and except for the faintest tremble all over his body, a muscular reaction from the violence of his passion, he had entirely regained his self-composure. This was quite characteristic of the mountain men. They share with the beasts a passion of living that is wholly unknown on the plains; but yet they have a certain quality of imperturbability known nowhere else. Nor is it limited to the native-born mountaineers. No man who intimately knows a member of that curious, keen-eyed little army of naturalists and big-game hunters who go to the north woods every fall, as regularly and seemingly as inexorably as the waterfowl go in spring, can doubt this fact. They seem to have acquired from the silence and the snows an impregnation of that eternal calm and imperturbability that is the wilderness itself. Cranston wasn't in the least afraid. Fear is usually a matter of

uncertainty, and he knew exactly where he stood.

It is extremely doubtful if a plainsman would have possessed this knowledge. But a plainsman has not the knowledge of life itself that the mountaineer has, simply because he does not see it in the raw. And he has not half the intimate knowledge of death, an absolute requisite of self-composure. The mountaineer knows life in its simple phases with little tradition or convention to blur the vision. Death is a very intimate acquaintance that may be met in any snowdrift, on any rocky trail; and these conditions are very deadly to any delusions that he has in regard to himself. He acquires an ability to see just where he stands, and of course that means self-possession.

This quality had something to do with the remarkable record that the mountain men, such as that magnificent warrior from Tennessee, made in the late war.

Cranston knew exactly what Snowbird would do. Although of a higher order, she was a mountain creature, even as himself. She meant exactly what she said. If he hadn't climbed from Dan's prone body, she would have shot quickly and very straight. If he tried to attack either of them now, her finger would press back before he could blink an eye, and she wouldn't weep any hysterical tears over his dead body. If he kept his distance, she wouldn't shoot at all. He meant to keep his distance. But he did know that he could insult her without danger to himself. And by now his lips had acquired their old curl of scorn.

"I'll go, Snowbird," he said. "I'll leave you with your sissy. But I guess you saw what I did to him—in two minutes."

"I saw. But you must remember he's sick. Now go."

"If he's sick, let him stay in bed—and have a wet nurse. Maybe you can be that."

The lids drooped halfway over her gray eyes, and the slim finger curled more tightly about the trigger. "Oh, I wish I could shoot you, Bert," she said. She didn't whisper it, or hiss it, or hurl it, or do any of the things most people are supposed to do in moments of violent emotion. She simply said it, and her meaning was all the clearer.

"But you can't. And I'll pound that milksop of yours to a jelly every time I see him. I'd think, Snowbird, that you'd want a man."

He started up the trail; and then she did a strange thing. "He's more of a man than you are, right now, Bert," she told him. "He'll prove it some day." Then her arm went about Dan's neck and lifted his head upon her breast; and in Cranston's plain sight, she bent and kissed him, softly, on the lips.

Cranston's answer was an oath. It dripped from his lips, more poisonous, more malicious than the venom of a snake. His late calm, treasured so much, dropped from him in an instant. His features seemed to tighten, the dark lips drew away from his teeth. No words could have made him such an effective answer as this little action of hers. And as he turned up the trail, he called down to her a name—that most dreadful epithet that foul tongues have always used to women held in greatest scorn.

Dan struggled in her arms. The kiss on his lips, the instant before, had not called him out of his half-consciousness. It had scarcely seemed real, rather just an incident in a blissful dream. But the word called down the trail shot out clear and vivid from the silence, just as a

physician's face will often leap from a darkness after the anesthesia. The whole scene in an instant became incredibly vivid—the dark figure on the trail, the girl's white face above him, narrow eyed and drawn-lipped, and the dark pines, silent and sad, overhead. Something infinitely warm and tender was holding him back against a holy place that throbbed and gave him life and strength; but he knew that this word had to be answered. And only actions, not other words, could be called its payment. All the voices of his body called to him to lie still, but the voices of the spirit, those higher, nobler promptings from which no man, to the glory of the breed from which he sprang, can ever quite escape, were stronger yet. He tugged upward, straining. But he didn't even have the strength to break the hold that the soft arm had about his neck.

"Oh, if I could only pull the trigger!" she was crying. "If I could only kill him—"

"Let me," he pleaded. "Give me the pistol. I'll kill him—"

And he would. There was no flinching in the gray eyes that looked up to her. She leaned forward, as if to put the weapon in his hands, but at once drew it back. And then a single sob caught at her throat. An instant later, they heard Cranston's laughter as he vanished around the turn of the trail.

For long minutes the two of them were still. The girl still held the man's head upon her breast. The pistol had fallen in the pine needles, and her nervous hands plucked strangely at the leaves of a mountain flower. To Dan's eyes, there was something trance-like, a hint of paralysis and insensibility about her posture. He had never seen her eyes like this. The light that he had always beheld in them had vanished. Their utter darkness startled him.

He sat up straight, and her arm that had been about his neck at her side. He took her hand firmly in his, and their eyes met.

"We must go home, Snowbird," he told her simply. "I'm not so badly hurt but that I can make it."

She nodded; but otherwise scarcely seemed to hear. Her eyes still flowed with darkness. And then, before his own eyes, their dark pupils began to contract. The hand he held filled and throbbed with life, and the fingers closed around his. She leaned toward him.

"Listen, Dan," she said quickly. "You heard—didn't you—the last thing that he said?"

"I couldn't help but hear, Snowbird."

Her other hand sought for his. "Then if you heard—payment must be made. You see what I mean, Dan. Maybe you can't see, knowing the girls that live on the plains. You were the cause of his saying it, and you must answer—"

It seemed to Dan that some stern code of the hills, unwritten except in the hearts of their children, inexorable as night, was speaking thru her lips. This was no personal thing. In some dim, half-understood way, it went back to the basic code of life.

"People must fight their own fights, up here," she told him. "The laws of the courts that the plains people can appeal to are all too far away. There's no one that can do it, except you. Not my father. My father can't fight your battles here, if your honor is going to stand. It's up to you, Dan. You can't pretend that you didn't hear him. Such as you are, weak and sick to be beaten to a pulp in two minutes, you alone will have to make him answer for it.

I came to your aid—and now you must come to mine."

Her fingers no longer clasped his. Strength had come back to him, and his fingers closed down until the blood went out of hers, but she was wholly unconscious of the pain. In reality, she was conscious of nothing except the growing flame in his face. It held her eyes, in passionate fascination. His pupils were contracting to little bright dots in the gray irises. The jaw was setting, as she had never seen it before.

"Do you think, Snowbird, that you'd even have to ask me?" he demanded. "Don't you think I understand? And it won't be in your defense—only my own duty."

"But he is so strong—and you are so weak—"

"I won't be so weak forever. I never really cared much about living before. I'll try now, and you'll see—oh, Snowbird, wait and trust me: I understand everything. It's my own fight—when you kissed me, and he cried down that word in anger and jealousy, it put the whole thing on me. No one else can make him answer; no one else has the right. It's my honor, no one else's, that stands or falls."

He lifted her hand to his lips and kissed it again and again.

And for the first time he saw the tears gathering in her dark eyes. "But you fought here, didn't you, Dan?" she asked with painful slowness. "You didn't put up your arms—or try to run away? I didn't come till he had you done, so I didn't see." She looked at him as if her whole joy of life hung on his answer.

(Continued Next Week)

Lenten Days

These are Lenten days for the faithful. Even the congressional seed is said to be insufficient to go around.

"IT CAN'T BE DONE"

Somebody said that it couldn't be done.

But he, with a chuckle, replied That "maybe it couldn't," but he would be one.

Who wouldn't say so till he tried. So he buckled right in, with a trace of a grin.

On his face, if he worried he hid it. He started to sing as he tackled the thing.

That couldn't be done—and he did it.

Somebody scoffed: "Oh, you'll never do that—"

At least, no one ever has done it."

But he took off his coat and he took off his hat.

And the first thing we knew he'd begun it.

With the lift of his chin, and a bit of grin.

Without any doubting or quiddit.

He started to sing as he tackled the thing.

That couldn't be done—and he did it.

There are thousands to tell you it cannot be done;

There are thousands to prophesy failure;

There are thousands to point out to you, one by one,

The dangers that wait to assail you. But just buckle in with a bit of a grin.

Then take off your coat and go to it;

Just start in to sing as you tackle the thing.

That "cannot be done"—and you'll do it.

TOP-DRESSING TALK No. 3

Rejuvenate Your Orchard

Upper photograph: Average yield from unfertilized tree, Ben Davis variety. Lower photograph: Average yield from fertilized tree, Ben Davis variety.

Test by Everett Craig, Mt. Healthy, Ohio.

(From Ohio Bulletin No. 339, "Orchard Rejuvenation in Southeastern Ohio.")

"Grass-mulch culture plus fertilization with quickly available nitrogenous plant food gave an average gain of 22 barrels of apples, or a net cash gain of \$71.48 per acre per year over the tillage-cover-crop system without fertilization."

"Under the tillage-cover-crop system, fertilization with nitrogenous plant food gave a gain of 20.3 barrels of apples, or a net cash gain of \$50.96 per acre per year, over no fertilization under the same cultural conditions."

ARCADIAN SULPHATE OF AMMONIA

The proper time to apply a quickly available nitrogenous fertilizer is three weeks before the trees blossom. Arcadian Sulphate of Ammonia, applied over the feeding roots at the rate of 100 to 300 pounds per acre, will invigorate your trees, stimulate fruit bud formation, increase the

amount of fruit set and enable the trees to carry and mature a larger crop of finer fruit.

Demand Arcadian from your dealer. It is in better physical condition, it is quickly available and it doesn't wash out of the soil. "A little goes farther."

TALKS WITH THE BOYS

EDITOR'S LETTER

To the Boys:

I wish you could have been at the State Products Show at Harrisburg last week. The exhibition was very interesting and instructive. State College had a splendid exhibit and any real live farm boy would be inspired to go to State College sometime if he possibly could. Another feature was the exhibition of work done by the pupils of the vocational schools throughout the State. No doubt some of you had work there. Well, it was great and I only felt sorry that every farm boy and girl does not have an up-to-date school of that kind within reach. Then, there was the exhibit of the boys' and girls' clubs which attracted a great deal of attention. If the old saying, "We learn to do by doing" is true, then the next generation of farmers is going to put us older ones in the shade, because they are learning how to do things the best way now so they will avoid many costly mistakes. Our space is limited this week and I will only take space to encourage you to keep up the good work. Our department is getting a good deal of attention and we want to make it worth while.

Sincerely,
The Editor

HAS SOME TROUBLE

Dear Editor—I saw in the Pennsylvania Farmer that you wished to start a boy's corner in the paper and I wish to help you along with it.

I am fifteen years old, am on a farm and have five brothers, all of whom want to boss me. I don't mind one boss but when there is three or four, that gets my goat.

Now I wish to say I do not do everything perfect and it seems they impose on me a good bit and I get cross and tell them I don't want to do it. This morning I cleaned a steer stable after father went to Quarryville, but when he came home I had it finished and it seemed to please him. The rest of my spare time I split wood and fought.

When I am cross I am liable to say anything. So the other day I told them I was going to leave in the spring and they said I would be glad to come back, now I wish to get your opinion of my case.—John.

Now, John, whatever you do, don't work yourself up to a pitch where you will leave home to spite somebody else. It is all right to work away some when you can be spared but never desert a post. Older brothers are often over-bearing and inclined to impose upon younger brothers, but don't take it too seriously. No doubt they think all the world of you, but, boy-like, they try not to show it. Your best plan is to try to cultivate patience. Do your own work patiently, and above all things keep from quarreling. It always pleases a bully to get somebody mad—especially a smaller person. I hope older brothers everywhere will think over this subject. You may think your meanness is fun. It is a low grade of fun and may cause permanent injury to the object of your so-called sport. Above all things, John, don't cultivate self-pity. Don't let yourself believe that you are a badly used boy and get in the habit of pitying yourself. That makes you weak. Stick to your guns. Learn to smile and keep your temper.—Editor.

STUDIES BIRDS

Dear Editor—I certainly am glad the Pennsylvania Farmer has set aside a space for the boys. I am sure this will bring many boys in closer touch with the paper and by doing so they will be educated in many lines of farming. I read a fine story on birds in the Jan. 22d issue and I think it was splendid.

One of the most useful birds to the farmer is the horned owl. This bird is very large and strong. It has large yellow eyes. This bird is very useful to the farmer because it catches and eats many mice. It will soar in the air until it spies its prey, then with a quick swoop it will catch it up with its sharp claws.

The horned owl tears its food to pieces with its claws, then eats the meat and the bones and fur are cast off. Altho this bird lives mostly on mice it also eats rabbits and many other pests—of the farmer.

If you closely watch the habits of this bird you will find it searches for its food mostly at night. If anything tries to harm its young it is a fierce fighter but otherwise it is a shy bird.

Now that you see this bird is so useful to the farmer by destroying mice and rabbits let's not kill any more owls. I have had a very fine visit but now I must say good-bye.—Aaron A. Dieffenderfer, Union Co., Pa.

WILL MAKE A GOOD FARMER

Dear Editor—I certainly think it is nice that the boys and the Editor are going to have a page too, as well as the rest, and I wish this page great success. I am 13 years old. I have one brother older. He was one of the Butler County boys that went to State College last June. There he won a free trip to the great Eastern Exposition in Massachusetts. I have a sister and brother younger than I. I live on a 130-acre farm. I own one-fourth interest in twelve head of thoroughbred Holstein cattle.

Three years ago I won a Berkshire hog for having the best ten ears of corn in the boys' corn club which was held in Butler. I mowed and raked over 100 tons of hay last summer. We have a sulky plow, and I do most of the plowing as well as some of the harrowing and rolling.

I have about a mile to go to school. I am in the eighth grade. I like to go to school and we have a good teacher. I hope that more boys may get interested and help to make our page a page in the Pennsylvania Farmer that every one will want to see.—Howard F. Fox, Butler Co., Pa.

LIKES OUTDOOR LIFE

Dear Editor—I am very fond of outdoor sports. I love to hunt and trap. I have a .22 cal. repeating rifle. I have eight traps set for skunk and minks. I caught two minks last fall and got \$5 for one and \$10 for the other.

I am glad there is a page in the Pennsylvania Farmer for boys. If every boy writes a little letter the page will soon be full. I am 13 years old, I go to school and am in the seventh grade. We own 13 acres of woods, so I do most of my trapping on our own land.—Guy Bliss, Jefferson Co., Pa.

PASSING EVENTS IN PICTURES

THE GRANGE AND THE FARM BUREAU

Note—We have received a number of letters on this subject since the meeting of the State Grange, most of which were too personal or too critical for publication, we thought; but the following is a temperate discussion of an important question and we gladly publish it. The writer bravely signed it but we withhold the name at our own suggestion.—Editors.

The position taken by the Pennsylvania State Grange towards the Farm Bureau will not only be hard to justify, but still harder to maintain. It is not so much a question whether the influences back of the Farm Bureau movement are right or wrong, but whether the Grange has either the legal or moral right to dictate to its members which organization they may or may not join.

If it has such a right then it could readily prevent its members from joining the church, Masons or Odd Fellows, and certainly no such power was ever granted it, either by its own representatives or by the National Grange. The right to join any organization is either a moral, civil, social, religious or political one and must not be interfered with by the Grange.

The Grange has been in existence for more than a half century and during that time has obtained a membership of about 7,000,000. Thirty-three states have been organized and it is absurd to think an organization that can do that does not possess some merit, or that its members are actuated by dishonest motives. Many members of the Grange are also members of the Farm Bureau and we challenge their integrity when we accuse the farm bureau of being in control of selfish or corporate interests.

The Grange should consider carefully its attitude towards the farm bureau and be not too hasty in passing judgment upon the movement. There is no power in a threat, nor argument in abuse. A bluff usually works until called and in this case it has been called and the work of federating is going forward. The same energy and thought required to keep a granger from joining the farm bureau, would, if rightly directed, secure two members for the Grange, instead of wasting our energies in fighting a new organization let us use them in building up our own.

Lincoln gave us some splendid advice when he said, "Let not him who is houseless pull down the house of another, but let him work diligently and build one for himself, thus, by example, assuring that his own shall be safe from violence when built."

If we build our own organization along the lines laid down by its founders we have nothing to fear from others. If the farm bureau movement is wrong, it will soon fall of its own weight, but if it is right, then it will be far better for the Grange to have the farm bureau as a friend than an enemy.

These words come to us as we write "cherishing in our hearts every kind feeling towards all other orders and associations which seek to prevent human welfare, let us strive with them, working hand in hand for the good of our fellow-beings." You will note that there is no threat, no display of fireworks of any kind, but an earnest desire to be helpful. This is the spirit in which the Grange was conceived and only in this spirit will it be able to grow in strength and numbers and maintain its existence.

The man who wrote those words must have been inspired by God and

Growers Count on \$500 Profit per Acre

Along the
Seaboard
the south's newest great railway.

Florida growers count on securing \$500 to \$1000 worth of vegetables per acre at least. It is not uncommon to net as much as \$1000 per acre. Celery produces a gross of \$1800 and often over \$3000.

Tomatoes and lettuce return \$700 to \$1200 per acre. Crops are marketed every month at "hot-house" prices.

Farming on The South Carolina Coast

On the coast of South Carolina, cabbages and melons are big money makers. Vegetables are raised to follow the Florida crop. Profits range from \$500 to \$1000 per acre. Productive land is cheap. Wonderful corn yields are made and livestock produced at low cost with long grazing seasons and home-grown concentrates.

Write me for information about farming opportunities in country opened up by the Seaboard in Florida or on the South Carolina Coast.

given a vision of future. He knew that in due time rival organizations would spring up and that bitter seeds of jealousy would be sown. Let us accept his words of wisdom in guiding our future action, "and with malice towards none, but with charity for all, let us strive to finish the work we are in."—A Long-Time Granger.

JUSTICE FOR ALL

Editor Pennsylvania Farmer:

I love to "pick thru" the crop of good things furnished every week by Pennsylvania Farmer, and make note of anything that stands out conspicuously as worthy of repetition, or, more careful consideration.

Two such instances I find in your issue of January 15 and which, coming from two different sources, are identically the same in meaning and righteous significance.

The first is where you write in the editorial—Government and Business—"It is not enough that a governmental policy apply equally to all classes; all policies, to be acceptable should be economically sound and morally just." The other is your quotation from Governor and Vice-President-elect Coolidge, that, "The great thing for all agriculturists to remember is the interdependence of all our national activities."

Both of these statements are indeed timely and illuminating, when, all over the world, class, business and national selfishness seems to be "running riot."

While it is well that statements like these should be uttered, no definite result will be obtained except an earnest effort is made to find how to make governmental policies accord with economic justice and morality, or how to impress the usually class selfish mind with the truth, that no permanent progress can be made by any one class enjoying governmental favor—at the expense of some or all of the other classes.

To my mind, before we can build up a governmental policy strictly sound and just, we must "lay the axe to the root of the tree" of the private control or ownership of the natural resource of land—the God or Nature given source of all wealth.

While the producers of wealth (farmers, business men, manufacturers, mechanics and laborers), have to give up, in purchase price or yearly rental, a large portion of their production for nothing but the mere permission to produce, our governmental policy will remain economically unsound and unjust, and little, if any, thought will be given to Mr. Coolidge's advice. The continuance of our present policy almost compels the farmer and all other classes of useless producers to fight for their own selfish interests regardless of the rights and economic advancement of their neighbors and, what would be under free conditions of production, friends.—Oliver McKnight.

Good Advice

"This—uh—glub—spaghetti is awful—lob—glob—slippery stuff!" complained a customer in the rapid-fire restaurant.

"Aw, don't try to eat it with your knife!" briskly said Heloise, the waitress. "Ketch it by the tail and reel it in."

"Where are the villagers who used to dance on the village green?" "You can now find them assembled in front of the village screen."—Film Fun.

Grows on all soils. Have Hulled Sweet Clover at Low Prices. Sold on a Money Back Guarantee. Write today for Big Seed Guide. Free. American Nutritional Seed Co., Dept. 59 Chicago, Ill.

MORE HORSE POWER

Spring clipping puts pep and pull into horses. Clipped horses dry off quickly, rest well at night, get the full benefit of their food and are fit and ready. No colds, stiffness or other ailments, to which horses low in vitality are easy prey. Heavy spring work takes vitality from unclipped horses. That's why farmers who value horsepower clip in the spring. Authorities urge it. It pays big.

This Stewart No. 1 Ball Bearing Machine makes clipping easy—lasts a lifetime. Used for clipping dairy cows as well. Complete, \$14.00.

More Wool Money

Shear with a Stewart Machine. Leaves no ridges—gets 15% more wool. Saves time, makes money. No cuts. Easy for anyone to use. If you have a Stewart Clipping Machine, get a Stewart shearing attachment. If not, get a Stewart No. 9 Ball Bearing Shearing Machine. If you have an engine, write for Catalog No. 60.

Your dealer has Stewart Machines, or you can buy from us—send \$2 with order, pay balance on arrival.

Stewart No. 9 \$22.00

As Reliable as Horses and Much Faster!

YOU can depend upon your Huber Light Four to serve you as steadily and dependably as your horses ever have. It is ready to work, every day, all day, unaffected by heat, flies, or fatigue.

The Huber Light Four pulls three plows and turns an acre an hour. It gets the plowing done on the few choice days when the ground is just right and assures a bigger yield. It works the ground more thoroughly. It saves time at harvest and does all belt work, even running a light thrasher.

The Huber Clutch

Among the features that contribute to the exceptional dependability of the Huber is the counter balanced friction clutch. The friction arm is screwed on the end of the transmission shaft, assuring perpetual rigidity. Pull the lever and the friction collar moves toward the motor expanding the friction shoes against the inside of the fly-wheel. There is no end thrust on the motor or transmission. The large friction area assures a tight grip and makes smooth engagement possible. This is only one of many Huber points of superiority.

GARLICKY WHEAT

Recently Prof. Thomas B. Symons, director of the University of Maryland extension service, addressing the county agents, drew attention to the great handicap of the term "garlicky" applied to wheat inspection, as the name prejudiced the foreign buyers, and they would not pay as much for it and it was now selling at 15 cents discount per bushel. Further, he said that seven-eighths of all the wheat grown in Maryland is classed as "garlicky," and suggested that the farmers of the state petition the national government to substitute another name.

I am sure the farmers are pleased to see this awakening of the agricultural interests of the state to such serious and drastic conditions of many months long standing. Certainly it would have helped greatly if this same advice had been given last fall to these same state representatives that farmers be urged not to seed garlic wheat, not that the garlic would trouble this year, but what about the years to come?

Last October a writer in the Maryland Farmer called attention to this very condition and showed the then discount between the shipping and "garlicky" grades was 20 to 22 cents per bushel. Following this publication the price narrowed to 10 1/2 cents, while lately it has rolled around 14 1/2 to 15 cents, and this is in midwinter, when garlic is supposed to waste in winter's cold.

Some years ago, when these grades were being established by the Government, Senator Joseph I. France, who understood Maryland conditions, strenuously opposed using the term "garlicky" and the wisdom of his forethought stands clearly out now, under present handicaps. With a stock now (I am informed) in the elevators here of this grade of 1,750,000 bushels, and January being a month in which taxes must be settled in the counties, makes for a worse condition for this high cost produced wheat, and this ruinous difference and long ruling on only "one-half of 1 per cent garlic" certainly shows a most serious condition for the producers and calls for some real strenuous activity from the highest agricultural interests of the state.

Director Symons advises the farmers to petition the government for a change of name, which is all right as far as it goes, but why is such a drastic financial situation saddled on the farmers to handle when clearly it is one of the problems that the regents of the University of Maryland should energetically push, and the initiative should have come from this source months ago, more especially, if the College Park officials could not work out a solution.

Garlic shrivels in cold weather (it's January now), but as a further help, could not the dryers in the elevators be used to advantage, and with the screening and blowing, should not this wheat grade higher? Certainly it would have a much broader market and sell by sample at a much narrower difference than now and thus prove a real financial help to many. Farmers, don't you see that you need an agricultural college as a separate unit, but coupled up with the state's educational park, but with a board keenly sympathetic to your farm problems and energetically alive, working for their betterment.

In this case, is it "too much universality" or not enough interest in your agricultural activities?—C. Bosley Littig in Baltimore Sun.

Don't Send 1 Penny

Just send your name and address and I will send this sweater and pair of trousers to you. You don't pay one penny until they are delivered at your door by the postman. Trousers alone are worth more than \$2.50, so you are getting the sweater for only 1 cent. Send your order now.

Men!!
Pants and Sweater
Both \$2.98 for \$2.00

The trousers are made of a very strong and durable gray striped material. They have custom pockets and belt straps. All seams are double stitched and guaranteed not to rip. These trousers would ordinarily sell for more than \$2.50. Color: Oxford gray stripe only. Size: 30 to 44 inches waist measure. The sweater is made of heavy commercial yarn, woven in slip-over style, with round neck and sleeve cuffs. Fits snugly to body. Colors: Khaki or navy blue. Size: 34 to 40 chest measure. Remember, one sweater and one pair of trousers for \$2.98. They will not be sold separately.

Delivery Free Just send your name and address—no money. We will give size and color. When the sweater and trousers are delivered at your door by the postman, pay him \$2.98 for them. We have paid the delivery charges. Wear both articles and if you don't find them all you wanted, return them and we will cheerfully refund your money at once. Order by No. 42.

SLAG AS A ROAD BED

Conowingo Furnace, Lancaster Co., Pa., blew out in 1865, after being in operation for upwards of seventy-five years—during that time large quantities of slag were made and hauled out in great piles, amounting to thousands of tons. Four years ago the supervisors of East Drumore Township decided to experiment with this slag as a road bed, selecting a stretch of quick sand on which to make the test. Since then, nothing has been done to it and it has worn well and would wear a year or two more without special need of any repairs. Winter and summer it has been the same, no mud in winter, no dust in summer.

The supervisors of East Drumore Township have recently purchased the entire deposit on what is known as the Nolt bank and expect in the near future to begin hauling and laying the road bed from Quarryville Cemetery to Hopkins Mills.

The state has recently taken up the slag experiment, also, and on several places on the state highway between Quarryville and Holtwood between six and seven hundred two-horse loads were laid recently, which were taken from what is known as the Hopkins bank.

The supervisors of East Drumore Township expect to open the great project for the township by appointing a "good roads day" and inviting the farmers and working men of the township to give that day with teams, shovels and picks free and they will do it. It has been proven to satisfaction of the taxpayers of the township that this slag makes a more lasting road bed than stone and being easy of access and much cheaper.

The wearing qualities of slag comes from the fact that it does not grind into dust like stone to be blown away by the wind but becomes more like sand and does not respond to every little breeze that comes along, neither is it so readily washed away by heavy rains.—J. B. M.

DAYLIGHT SAVING

Is it not a mistake to consider the daylight saving law a benefit, even to city workers? A lawyer, discussing the question last year, said he liked it himself because it was not burdensome to him to get to his office an hour earlier but for factory workers it was a vastly different matter; in hot weather very often the early part of the night is so hot it is impossible to sleep until after midnight—often till 2 o'clock—and the working man seriously needs the extra hour for sleep. If a man does not need to rise till 9 or 10, getting up at 8 is no particular hardship, but for a man who usually rises at 5 it is not desirable to rise at 4. I fail to see where in the plan has a good point except for leisure people.—E. M. A.

MODIFY BEETLE QUARANTINE

The quarantine established by the Pennsylvania Department of Agriculture against the Japanese beetle, in the eastern part of the state, has been modified in the case of cut flowers and cut flower products. The quarantine, as originally issued, provided that cut flowers moved from the areas under quarantine, should undergo Federal inspection at all seasons of the year. The modification provides that cut flowers being shipped from the quarantined area need undergo inspection only between June 15 and Nov. 1 of each year.

They Were First Made for Farmers

Tho' Boss Gloves are now worn in every industry requiring hand work, they were first made for farmers' use exclusively. They were planned to meet the farmers' needs. They are made extra strong to withstand the hard wear of farm work.

For plowing, driving, silo filling and use around the ensilage cutter, for installing new equipment, for post-hole digging and fencing, for tiling and drainage work, and a hundred and one jobs around the farm, Boss Work Gloves protect the hands from dirt, grease, and minor injuries.

Boss Work Gloves are made of the highest quality, heavy weight canton flannel. They wear long and well. Yet they are so flexible that they allow a free feel of any job.

Look for the Boss trade-mark sewn on the back of the gloves. Ask for Boss Work Gloves by name. They come in three styles of wrist—ribbed, band, and gauntlet. Sizes for men and women, boys and girls.

THE BOSS MEEDY—best quality, medium weight canton flannel.
THE BOSS HEVY—very best quality, heavy weight canton flannel.
THE BOSS EXTRA HEVY—finest grade of extra heavy canton flannel.
THE BOSS WALLOWER—highest quality, heaviest weight canton flannel.
THE BOSS LETHERPOM—heavy canton flannel with tough leather on palms, fingers and thumbs.
THE BOSS JERZY—highest quality cotton jersey cloth in many colors.
THE BOSS TIKMIT—Roomy mittens made of ticking that wears like iron.
THE BOSS ELASTO—strong canton flannel. Made by a patented process in one weight only.

NEW FEEDS

By W. H. Tomhave

The farmer and live stock producer is constantly confronted with the problem of deciding just what feeds are most economical for his use. He has access to an abundance of data regarding the standard feeds upon the market. Most of these feeds have been used in feeding tests at the different experiment stations with live stock of different ages and classes. With a knowledge of the feeding value and the price per ton of such feed, it becomes an easy matter to decide which feed to purchase and the combination that should be fed.

We find, however, that new feeds are constantly being manufactured and put on the market. The farmer is urged to purchase such feeds by the dealer who is interested in the sale and distribution of the feed in question. If the feed is a product such as tankage, meat meal, cotton-

entire feeding period. The amount of corn consumed in the two lots varied but little while there was a marked difference in the amount of protein supplement consumed. The corn and tankage lot consumed 4904.9 pounds of corn and .293 pounds of tankage. The other lot consumed 4927 pounds of corn and 494 pounds of commercial mixture. There was very little difference in the average daily gain per pig; 1.64 pounds in the corn and tankage lot and 1.59 pounds in the other lot.

The feed required to produce one hundred pounds of gain is of importance. It required 412.5 pounds of concentrates to produce one hundred pounds of gain in the corn and tankage group and 441 pounds in the corn and commercial mixture group. The ratio or proportion in which the corn and protein supplement was consumed is an interesting factor. The pigs seem to have a keen appetite for the commercial mixture and consumed it at the rate of one pound

Champion Berkshire Barrow. International Livestock Exposition, Chicago, Ill., 1920. Exhibited by Pennsylvania State College

seed meal or oil meal with a guarantee of a certain per cent of protein, its value is readily determined.

The function of the experiment station is to study the feeding value of straight feeds that are likely to be put on the market and used by the farmers. During the past season, a feeding test was conducted at the Pennsylvania Experiment Station to study the value of tankage and a commercial feed composed of bone and tankage, as a source of protein in fattening swine for market. Both of these products are manufactured in the packing house. The tankage used was a 60 per cent protein product. The commercial mixture is made by adding 10 per cent of bone meal to a 60 per cent protein tankage, thus producing a product of lower protein content than the higher grade material. The object in adding the bone meal to the protein feed is to produce a feed that is high in mineral content. The feeding trial was conducted with well grown, thrifty pigs weighing about 100 pounds when the test was started. Each lot contained twelve pigs and both lots were fed for a period of sixty-four days when they were marketed. The feed consisted of shelled corn and the protein supplement. Both groups were fed from a self-feeder. Both lots had access to a quarter of an acre of good rape pasture during the

for each nine pounds of corn consumed, while the other lot required one part of tankage to 16 pounds of corn. There was not only a difference in the amount of feed required to make 100 pounds of gain and the amount of protein supplement consumed but in the cost of production. The shelled corn was valued at \$1.65 per bushel, tankage \$1.10 per ton and commercial mixture at \$100 per ton. The cost of the forage for each lot was based upon the actual cost involved and amounted to \$5.86 per lot. After allowing for the cost of the forage consumed, the total grain cost for the two lots was as follows: Corn and tankage, \$160.76 and \$169.75 for the corn and commercial mixture lot. In this case the cost of feed was nine dollars more in the one lot than in the second lot. This factor would be of minor importance if the lot that cost the greater amount for feed consumed had made greater gains and possibly sold for more money per hundred pounds live weight. Such was not the case, however. The lot that cost the least amount of money for feed consumed made greater gains during the feeding period and also made the greater gains for every hundred pounds of feed consumed. The cost of making 100 pounds of gain in this case was \$12.74 where the hogs were fed tankage and corn and \$13.90 per hundred

GOMBAULT'S CAUSTIC BALSAM

THE STANDARD REMEDY
HUMAN and VETERINARY

It is generally true that an external remedy that is good for the animal is also good for the human body, and Gombault's Caustic Balsam is no exception to this rule. The many testimonials received from physicians and veterinarians are convincing proof of its merits. Rheumatism, Backache, Neuralgia, Sprains, Strains, Lumbago, Sore Throat, Stiff Joints, in fact any ailment requiring an external application can be treated with absolute safety and the beneficial results produced are all that could be desired.

Soothing and Healing--A Perfect Antiseptic

As a veterinary remedy its curative qualities have been acknowledged for many years in cases of Curb, Splint, Sweeney, Capped Hock, Strained Tendons, Spavin, Ringbone and other bony tumors. A trial will convince anyone that here is a remedy without an equal. Write for any information desired. \$1.75 per bottle at druggists or sent by parcel post on receipt of price.

The Lawrence-Williams Co., Cleveland, Ohio

DELAWARE FARM NOTES

The executive committee of Sussex County Farm Bureau has chosen an organizing committee for the membership drive which will be under way in a short time. Following is a list of those selected and the communities in which they will work:

Milo Faber, Milford; Winter C. Bennett, Slaughter Neck; Mrs. E. B. Gates, Lincoln; G. W. G. Coughlin, Ellendale; Elmer Dickerson, Milton; H. H. Fisher, Lewes; T. C. Donovan, Midway; Edward Phillips, Rehoboth; S. E. Evans, Millville; Hiram James, Ocean View; James B. Dickerson, Roxana; G. E. Bunting, Edward McCabe, Seelyville; Reuben Evans, Frankford; R. D. Lingo, Jr., Dagsboro; John Dobson, Millsboro; John A. Jones, Georgetown; Theodore M. Jarvis, Harbeson; Edward Vaughn, Coolspring; William A. Carlisle, Greenwood; George A. Hill, Francis Morgan, Bridgeville; Thos. N. Rawlins, Seaford; Charles G. Otwell, J. E. Hearn, Laurel; William Ellis, E. W. Palmer, Delmar; William Lingo, Lewes; Dr. O. V. James, Gimbora.

The action of the Seaford Produce Growers' Association in refusing to contract for tomatoes the coming season unless the prices are satisfactory is to be taken up with all of the produce organizations in the county, and a request made of the members to fall in line with the farmers in the vicinity of Seaford.

At the annual meeting of the Seaford Produce Growers' Association, held on Saturday, Jan. 23, the election of six directors to serve for a term of three years was the principal item of business. Edward B. Brown, Ezekiel G. Coulburne, Daniel W. Ellis, Charles J. Elzey, Irvin F. Smoot and Fred L. Williams were elected.

The report of the treasurer gave some idea of the volume of business transacted by the Association for the year; more than \$22,000, having passed through the treasury, as compared with about \$8,000 the previous year.

One of the matters discussed was the approaching campaign for membership in the Farm Bureau, when it is expected that every farmer in Sussex County will be solicited. The farmers are realizing the necessity of thorough organization for their own protection. The Farm Bureau is nation-wide, and now has a membership of nearly 2,000,000 farmers.

The annual meeting of the stockholders of the Delaware Apple Company, was held last Saturday in the offices of Marvel & Layton, in the du Pont Building, Wilmington. The following directors were elected: Josiah Marvel, Prof. C. A. McCue, W. C. Bailey, H. Dildgely Harrington, Charles S. Rayburn, A. J. Taylor, E. C. Jones, Charles E. Enes, L. Mulford Taylor, G. D. Hopkins and James Howe.

Election of officers by the board of directors will take place some time in the near future.

The company will state in upon a sale of the present issue of stock with all debts paid and \$25,000 to \$30,000 in the treasury. It has grown an orchard in eleven years at a cost of about \$4 per tree.

The company owns the largest orchard east of the Mississippi comprising 76,806 trees on an acreage of something over 800. This orchard is located near Bridgeville, Del.

E. M.

COUNTY NOTES

Carroll Co., N. Y.—Weather has been good, farmers ploughing for yields happiness.

spring crops. Temperature has been above normal. At present temperature is lower. The lowest was four above zero, prospects of an ice harvest. Roads are good for this time of year and some farmers are hauling grain to elevators. Labor plentiful in Union Bridge district due to curtailed production of cement plant. The County Agent has secured an agreement with a woolen company to convert wool into blankets and motor robes for the producer. The prices for farm produce are: Chickens, 30c lb.; eggs, 64c doz.; butter, 45c lb.; wheat, \$1.80 bu. and \$3 per 350-lb. corn.—Harry I. Rinehart.

Wyoming Co., Pa.—Unusually mild weather with poor prospects for ice crop, no snow yet. Prices for farm produce very low, dressed pork, 12@14c; beef, 10@12c; eggs, 55c; butter, 55c; milk, \$3.39 for 3.6 per cent butter fat. Live stock hard to sell at any price. Farmers feel that prices of machinery, etc., must come down to correspond to prices of farm produce and are buying very little. Most of the dairymen here have signed the Dairymen's League co-operative contracts, and feel that the future of the dairy industry depends upon co-operative handling of the production end of the business at least.—P. A. Valentine.

Lackawanna Co., Pa.—Have had an open winter with more rain than snow, with alternate thawing and freezing with icy roads. Farmers harvesting ice crop, hauling out manure and getting out a supply of wood for the year. Those who are fortunate enough to have wood lots are burning wood in stoves and furnaces. Price of potatoes changeable, have been \$1.70 to \$1.50 per bu. Small ones \$1 per bu. Butter 55c lb. Eggs, 80@85c doz.—E. A. K.

Chataqua Co., N. Y.—Eggs have held their price well while everything else dropped, but now they, too, are down. Within a month the price dropped from 85c to 60c and is still falling. Butter is around 50c, but dropping rapidly. Hay and grain are worth on the market far less than it cost to produce them last summer. Potatoes \$1 bu. and apples almost free for the asking. People are very busy cutting wood because wood is about the only farm product that is marketable and every one who has a dairy must have feed for the cows.

The fact that manufactured goods are dropping a little, help some, but times surely look bad for every farmer whose living depends upon his farm operations. Men work where ever there is a job but help in the house is about as scarce as ever, and if it were obtainable at all the price would probably be less than formerly. Crops were plentiful last year and were, as a rule, well cared for. Most people are coming to raise their own wheat which means a vast saving in living expenses. We don't eat bread but we do keep a cow or two, if we are not dairymen and we use all the milk, butter and cream we can. Why not? Nothing else is so cheap.

People are housing and repairing farm machinery more carefully than ever before, only buying new when it is entirely unavoidable.

According to the views of our state superintendent of education, the firm of hand and brain is not yet ready to dissolve partnership.

Top-notch efforts nearly always

GUERNSEYS

A Wisconsin Grade Guernsey has produced 12,088 lbs. milk and 530 lbs. fat. Grade Guernseys are \$125, open framed, and produce liberal quantities of rich milk. Send for free booklets.

laying. Bred from fine stock. Write for prices. RANDOM FARM, BOX 6, GENEVA, OHIO.

Veterinary

Conducted by W. C. Fair, V. S.

Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full, also the name and address of writer. Initials only will be published. We cannot assume responsibility for the use of this column, when properly preserved and classified, make one of the most valuable mediums for a farmer-veterinarian club.

Swine.—Rheumatism.—Rickets—I have a few shoats that are troubled with a sort of rheumatism, some of them are down on front knees, other stiff in hind quarters. J. C. S. Jeannette, Pa. Feed less corn and more oats, oil meal and roots; also, keep them dry and warm. Give each pig five grains of nitrate of potash at a dose in feed or water once a day.

Choke.—Have four shoats 4 months old that are thriving, but one of them acts rather strange. It will come to trough to eat, take 2 or 3 mouthfuls, suddenly back up, fall over, struggle a minute, then get up and commence to eat as well as ever. What can I do? S. L. R., York, Pa. A hungry pig will occasionally choke. He fills mouth too full of dry sticky food. When he chokes he can't stand up for any great length of time and down he goes. After the mouth and throat is emptied he will usually get up and commence to eat as though nothing had happened. Spread out the feed, in order that he will have to eat slower. Wet it.

Indigestion.—Condition Powder—I have two work horses that are well fed, not overworked, but they refuse to lay on flesh. Their dung has a strong odor. S. C. Daniels, Pa. Their teeth may require floating. Change feed and perhaps increase the amount. Give each horse a dram of powdered sulphate of iron, a tablespoonful of bicarbonate of soda and same quantity of powdered gentian in ground feed 2 or 3 times a day.

Worms.—Thin Horse—I recently purchased a horse that is troubled with large and small worms. He eats twice as much hay and grain as any of my other horses, but remains thin. If you will tell me what to give him I will surely follow directions. W. W. Newbold, N. J. Give one dram castor oil, 30 grains calomel and half an ounce of powdered gentian at a dose in soft feed daily for four days. Discontinue for a week and then repeat treatment. Give a tablespoonful of ground gentian and a teaspoonful of salt in feed twice a day.

Scours.—Rolls in Stall—I have a 6-year-old horse that rolls in the stable. I find that when he rolls he is trying to scratch his neck from behind his shoulder. When I rub his neck between his shoulders and rump he will quit eating, hold his upper lip up as if he enjoyed the sensation. I have clipped his mane off. How can I prevent him from heating his head on water, and relieve the itching parts with soap and water, then apply one part sulphur, half a part carbonate of potash and four parts fine hard 3 times a week to itchy parts of body. At the end of two weeks, dust on flowers of sulphur daily. Give him a dessert spoonful of Denon's Solution at dose in feed twice daily. Feed some roots, and ventilate your stable.

Too Much Ration.—My 15-year-old horse has splendid appetite and apparently in good health but he is inclined to nurse too much. C. D. W., Tionesta, Pa. Change feed and give a teaspoonful of ginger and a tablespoonful of powdered gentian in each feed. Usually the feeder can remedy an ailment of this kind.

Wind-Sucker.—Chronic Gastritis.—Have 7-year-old horse that is a hoarse sound and good worker, but soon as halter or bridle is put on him, he immediately works this back between his shoulders and rump he will quit eating, hold his upper lip up as if he enjoyed the sensation. I have clipped his mane off. How can I prevent him from heating his head on water, and relieve the itching parts with soap and water, then apply one part sulphur, half a part carbonate of potash and four parts fine hard 3 times a week to itchy parts of body. At the end of two weeks, dust on flowers of sulphur daily. Give him a dessert spoonful of Denon's Solution at dose in feed twice daily. Feed some roots, and ventilate your stable.

Knuckling.—Contracted Tendons—I have a gelding on his toes, one leg worse than the other. He knuckles badly. A horseman told me it was result of shortening of the tendons, and advised me to have the tendons welded on the top of the shoes, extending them 1 1/2 inches beyond toe of foot. M. A. G., Lewisburg, Pa. In such a case as this the tendons between the knee, or hock and fetlock may be divided, with a view of lengthening the tendons, but this is work for a skillful veterinarian, who has had experience in operating on cases of this kind. In chronic cases of knuckling, mild remedies have but little effect.

Tedious Churning.—I have a young cow that is carrying her second calf, due to come fresh the last of March and she appears to be well, but I must churn two hours to make butter. I have the cream warm enough for the butter is soft, but it has a bitter taste. She is fed hay once a day and corn fodder twice daily. She is also fed clover composed of corn and bran and a few potatoes. W. F. Felton, Pa. First of all the cream should be kept in good condition, never try to hold the cream too long. Be sure to cool the cream before mixing it with what you have on hand and of course it should be kept clean. When you have enough cream for churning, warm up to 70 degrees F., allow to sour or ripen at that temperature. When the cream is of the desired ripeness cool to the churning temperature or below 50 F. Usually the warmer the cream the quicker it churns into butter. Have the churn clean and rinse with cold water after pouring in the cream. Allowing milk to stand too long before the cream is skimmed may account for the butter having a bitter taste. Your cow is doubtless healthy, but you are milking her a little too early.

Dormicing.—I have a cow whose horns grow new quickly and she makes it necessary to cut a portion off every few months. Am I doing not knowing how much to saw off? Can she safely be dormiced? T. S. H. May, Lansing, N. Y. Have both horns taken off by some person who makes a business of doing this kind of work. Cutting the points off is not best practice.

Popularity

SEVERAL factors help to explain why International Engines are popular wherever they are used. But the most prominent reason is that they do the work their owners want done when it should be done.

International Engine owners know that if there is feed to grind, the International will do it. If there is water to pump, the International will pump it. The same is true with wood sawing, churning, chopping feed, fanning grain, etc., etc. The International will turn the trick, when you give it a chance.

In accomplishing this, International Engines use low-grade fuels. They are simple to operate—many farmer boys not yet in their teens start and operate International Engines with ease.

International Engines have built-in magnetos, replaceable cylinder liners, enclosed crank cases. They are hopper-cooled, and have many other valuable features. Made in 1 1/2, 3, 6, and 10 h. p. sizes.

Send a postal for an engine pamphlet.

HARRIS BROTHERS CO. 35th and Iron St. CHICAGO -

Is the Milking Machine a Success?

This Symposium by Pennsylvania Farmer Readers Shows That It Is

SATISFACTORY AND ECONOMICAL

E. J. Rinehart, Maryland

HAVING had a machine for about two and a half years my knowledge of how a machine will hold out is limited somewhat. My brother purchased an individual pump milking system and it pleased him. I observed his milker in operation and to me it seemed to be a success.

Wishing to better milking conditions without such a large outlay of money, I purchased an individual pump system. The units are single, each unit milking one cow at a time and a pump goes with each unit. The test cups fit any sized teat. All four teats are milked at the same time and the suction is completely released at each stroke of the pump, which makes 52 strokes per minute. Two units and an extra pail cost me \$125. Two pulleys, 50 feet of shafting, the necessary boxes and hangers plus the cost of installation amounted to \$84.14. Having an engine and not wishing to move same it took more shafting.

A milker is not considered a paying investment with less than fifteen cows, unless the engine is used for other work. I milk twelve cows with a 2½ horsepower gasoline, air-cooled engine which runs on dry batteries. The engine pumps water while milking. At the first milking with a machine, the man that installed the system was present and all went well. After mastering the machine, it was found to be a dependable helper. It heats hired help as it never gets sick nor wants a holiday and milks the same on Saturday evening as any other evening. Milking becomes a uniform operation, with the last cow milked as clean and as fast as the first. Contented cows give more milk. A machine never swears nor beats the cows. The youngest son, age 14 years, has started the engine and milked the twelve cows.

One man can milk a larger herd of cows with machine and thereby solve the labor problem. My milker will not draw blood even if left on after all milk is drawn. Is it hard on cows? No, cows with sore teats, tender udders or hard milkers are more readily milked, than by hand. Cows with sore teats, have stood quietly for machine and kicked when milked by hand. Heifers take to a machine more readily than hand milking, while old cows have to be broke in. Machines are a boon in fly-time, for nervous cows or cows that have a leak in their teat. No more udder trouble was had, while using machine, than with hand milking. The engine struck for a new dry battery and hand milking was necessary. From the way the cows acted, the uniform action of the milker must be more pleasing to them than hand milking. Will it dry the cows off? Well one cow milked nearly until she calved. The milk being good and cow's condition not being noted she was not forced dry.

Of course, it takes extra time to wash and care for the machine, but the speed with which the milking is done makes up the extra time. It takes on the average 30 minutes to milk twelve cows. The more cows the greater the time saved. The experimental station states that the time required for hand milking and washing of the utensils is greater than the time required for machine milking and washing the machine. An expert hand milker might milk a free-milking cow as quick as a machine but for hard milking cows the machine will lead. I strip my cows while my brother does not. To my knowledge his cows have no more udder trouble than mine. My conclusion is that if you strip after a machine the cows will expect it.

Anyone who attends to details can make a suc-

cess of machine milking. While milk from a machine will show less sediment when strained, unless the machine kept clean hand drawn milk will have a lower bacterial count. Though a milker is complicated, milk with a low bacteria count can be produced. It is easier to keep a milker clean than a cream separator. Immediately after milking, while test cups are attached and the cups are immersed in a pail of cold water and the water is sucked thru the tubes. Then the lid and tubes are placed in a tub of water containing a chemical preparation similar to peroxide. A fresh mixture is made twice a week. The milker should be thoroughly washed each time sterilizing solution is made fresh. The tubes are cleaned like a gun barrel and the test cups are taken apart and washed; also, the valve is taken apart. This method is fairly good but the correct method is necessary for hot weather.

The total cost of my milking system was \$240.14. The items which make up the cost are: Lumber, \$30; pulleys, \$11.20; 2 units and extra pail, \$125; shafting, boxes, pump hooks, guides, etc., \$52.94 and cost of labor for installing system was \$20. There is a certain yearly expense even though machine is not used. The following items will have to be charged off.

Interest on \$220.14 at 6 per cent. \$13.20
Depreciation at 15 per cent. 34.02
Taxes 2.00

Total \$49.22
As milk is hard on dairy utensils 15 per cent depreciation ought not to be too high.

The minimum life of test cup mouthpieces is about six months, while the maximum is about a year. I have obtained the maximum this year by using a new set of mouthpieces on cows with small teats and when they become large the mouthpieces were used on the other unit. The tubes seem all right with the exception that they are shorter. When the tubes fail to grip the connections, I cut about an inch off of the end of the tube, in order to make it tight. I broke several glasses thru carelessness. The glasses enclose the valves. One unit has the original glass on. The leather on one pump has been renewed at a cost of 25 cents. Several drops of harness oil should be placed in the pumps daily.

The cost of repairs for 2½ years has been—Mouthpieces for test cups, \$4; pump leather, 25c; 3 glasses at \$1 each, \$3; total, \$7.25. A yearly cost of \$2.90 for repairs. The \$3 ought to be charged to carelessness as the glasses were broken in the dairy while in a hurry. About 100 gallons of gasoline are used yearly. The gas cost \$30.50 this year. Allowing one-third of the cost for running the cream separator would leave \$20.34. As I pump water while milking, the half of \$20.34 would be the average cost of operating the milker, or \$10.17.

Yearly cost of operation \$10.17
Yearly cost of repairs 2.90
Yearly cost of B. & K. chemical 5.00
Depreciation, taxes, etc. 49.22

Total \$67.29

I think that it would cost about two cents a cow for hand milking at the present time, hence:

Average yearly cost of hand milking, \$170.00
Yearly cost of pails, about 50.00

Cost of hand milking 220.00
Cost of machine milking 67.29

Profit on machine milking \$152.71
I would look for the following points in a milker were I in the market:

(1) Simplicity. (2) Efficiency. (3) Durability. (4) Ease of Cleaning. (5) Ease of operation (a) visibility; (b) power required, and (6) Cost (a) initial cost; (b) cost of operation; (c) maintenance. (7) How does it affect the cows? —C. J. Rinehart, Union Bridge, Md.

MILKING MACHINE VALUABLE ASSET

A. B. Huey, Chester Co., Pa.

My experience with a milking machine covers a period of about five years of actual operation and many years of observation. We in this country, are prone to look upon a mechanical milking machine as an experiment, forgetting or not knowing that in Australia, the home of the mechanical milker, over 70 per cent of the cows are milked mechanically and there are many patents on milkers. In New Zealand over 75 per cent of the cows are milked by machines and I saw in a New Zealand paper of recent date in which twelve distinct patents on mechanical milkers are advertised. I have a neighbor who installed a mechanical milker, and after some eight months' trial, pronounced it a failure—not that it would not milk the cows, but from the amount of udder trouble he had from some cause not known.

I had some 45 cows and a son of a naturally mechanical turn of mind. I decided I would try this discarded milker, install it and see what my results were. While we were installing the milker my son had reason to go thru a thorough Guernsey Dairy about 15 miles away, and he there found a milker of the same make in actual operation for several years.

At the time our milker was installed, my son had been keeping a record for a year and a half of what was being done every half hour of the day for the National Government. This record contains one and one-half year's of hand milking and one and one-half year's of machine milking of the three years the record which were kept. The cows were in a cow-testing association thru the period of these tabulations, so the facts deducted are as true as can be procured.

The Federal Department during this period was making tabulations on four farms in four states which form the basis of Bulletin 501, "Cost of Milk Production." I quote from this bulletin Page 11, comparing the four farms. "The lowest labor requirement for cow is on the Pennsylvania farm when the milk is handled quite efficiently and delivered at nearby railroad station. The use of a milking machine during 1913 made the man labor requirement 38 hours per cow less than for 1912. The actual time of milking was reduced about one-half. With the exception of the Pennsylvania farm, the average man labor requirement per cow exclusive of marketing, on each of the farms for all the years, is approximately 200 hours. This is equivalent to an average of 33 minutes per cow per day, 365 days in a year." Thirty-eight hours per cow saved, at 30c per hour, the price of labor thru here, would represent a saving by the use of a milker of \$11.40 per year, per cow.

Now, while some may be able to hire labor cheaper than this, I doubt whether the great majority can reduce much the actual time consumed. Any one much interested in costs of milk production, should read this Bulletin 501. It can readily be obtained by (Continued on Page 9)

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

STARTING ALFALFA

"I have about twenty acres that I would like to seed to alfalfa. The soil is very poor and there are places where there is a heavy growth of wire grass. Will you please tell me how to fertilize this land, how to prepare the soil, what time to sow the seed and how much to use per acre? I am located near Red Bank."—F. F., Monmouth County, New Jersey.

F. F., New Jersey.—Good crops of alfalfa have been grown and are now being grown in the vicinity of Red Bank. Some trouble has been experienced from chickweed that in some fields has been crowding out the alfalfa. Other weeds are troublesome occasionally. For this reason, it is important to start with a clean seed bed. One of the effective ways for preparing a good seed bed for alfalfa would be to grow winter wheat and vetch or oats and Canada field peas. After the crop is harvested, the land should be plowed promptly and summer fallowed. In the case of

oats and peas about one and one-half bushels of Canada field peas per acre should be used. The crop might be harvested and fed green to stock or made into hay. It should be off the ground by the beginning of July. Prior to sowing the alfalfa, about August 20th in your locality, a good application of lime should be made. If ground limestone is used, the application should be at the rate of 3000 to 4000 pounds per acre. If hydrated lime is used, an application of one ton per acre should be made. After the lime is thoroughly harrowed into the soil, acid phosphate should be applied at the rate of 400 to 500 pounds per acre, and muriate of potash at the rate of 25 to 50 pounds per acre. The seed should be employed at the rate of 25 pounds per acre and may be sown by means of a wheelbarrow seeder—12½ pounds one way and a like amount in the other direction so as to assure an even distribution of the seed.

If alfalfa has not been grown on that field, it would be necessary to inoculate. Inoculation may be done by means of soil from an alfalfa field where there is a good stand of alfalfa. If alfalfa soil is used, care should be taken not to employ material from a field that is badly infested with chickweed or dandelions. The inoculation soil should be broadcasted at the rate of 300 to 400 pounds per acre and should be harrowed in prior to sowing the seed. In ordering alfalfa seed it would be well to stipulate American western grown seed.

POTATO GROWING

"Will you please give me some information as to how I should go about it to increase my potato yield? Last year I got seven hundred and fifty bushels from five acres. Only about two-thirds of the crop came up due, I believe, to injury caused by the hot formaldehyde treatment. What fertilizers and what varieties of seed would you suggest for early and late crops? Can you give me some information concerning the inoculated sulphur treatment for scab? How can I identify potato leaf roll and mosaic? Are there any good modern books on potato culture?"—H. A. C., Montgomery County, Pa.

H. A. C., Pennsylvania.—It is well to remember that for the July potato crop it pays to use a generous supply of readily available plant-food. A 5-8-5 or a 5-10-5 fertilizer would probably give better results with Irish Cobbiers and Spaulding than would a 4-8-10. For the later crop a 4-8-6 would probably give fully as good results as a 4-8-10. Extensive experiments carried on at the New Jersey Station on different soil types and thru several seasons indicate that 5 to 6 per cent

of potash is practically the maximum percentage that could be used profitably. They also show that about 1600 pounds of fertilizer per acre, used in the row, will give the maximum profit. As the quality of the soil grows better, somewhat larger amounts of fertilizer will return the maximum profit, especially in a season of abundant rainfall. There are growers who use as much as 2500 or 3000 pounds per acre. These growers are careful not to put all of the fertilizer in the row, but to broadcast part of it before planting and to supply the rest in the row. Among the potato growers in Maine it is the practice to put part of the mixed fertilizer in the row and to broadcast the rest over the row as the potatoes are beginning to show above ground.

Inoculated sulfur consists of commercial flour sulfur inoculated with bacteria that have the ability to change the sulfur into sulfuric acid. Thanks to the presence of large numbers of these bacteria, the sulfur is changed more quickly, the soil is made sour in a shorter period of time and the potato scab fungus, therefore, checked in its development. The season of 1920 was the first during which inoculated sulfur was compared with uninoculated sulfur under field conditions. These experiments indicate that inoculated sulfur is more effective than the uninoculated sulfur for controlling potato scab. It is recommended that the formaldehyde treatment be employed as usual even where inoculated or uninoculated sulfur is

Vitrified Tile Silo on a Chester County, Pennsylvania, Farm

broadcasted for controlling potato scab. The numerous experiments at the New Jersey Station show that the most effective results with sulfur for controlling scab are obtained when 300 to 500 pounds are broadcasted and harrowed in immediately before planting the potatoes.

A number of books on potatoes have been published, among them "The Potato," by Grub; "The Potato," by Samuel Foster, and "The Potato," by A. W. Gilbert.

The following named characteristics appear in the case of Mosaic and leaf roll.

Mosaic.—The leaves of the affected plants are usually mottled with light and dark green areas. Because of the fact that the darker green areas grow faster than the lighter areas, the leaf is sometimes very much crinkled and the edges turned down. In severe cases the entire plant is dwarfed.

Leaf Roll.—This can be detected on the young plants by the rolling upward of the margin of the lowest leaves, which are somewhat thicker and more leathery than normal leaves. The tips

of the older plants are frequently lighter in color and die earlier than normal leaves. The older diseased plant is usually but not always smaller than the normal plant; all the leaves may roll and are likely to be smaller; the color lighter and the entire plant bushy in character.—J. G. Lipman.

FERTILIZER GOOD FOR YEARS

When we think about buying commercial fertilizer for our farm crops we figure that a certain crop will take 200 pounds to the acre and that it will cost about \$3. We think that this must be charged up to the crop for that year. I am one who figures just about this way. But I am beginning to see that the average application of fertilizer is not entirely taken up by a crop the first year. It is apt to last for at least another year, and sometimes more than that. I have had some good evidence of this from time to time lately.

A few weeks ago I was walking over a field that I had in onions in 1916. We used about 800 pounds to the acre of a good grade, complete fertilizer. We raised good onions, too, and supposed that the fertilizer had paid. In fact it had paid, too. The next year that field and some more on one side was planted to potatoes. There was a noticeable difference where the heavy application of fertilizer had been used.

After that the same field was put to wheat and one could see the difference between the old onion bed and the rest of it. It was seeded to clover after that and this year it raised field corn.

I have been in discussions about the amount of fertility left in the soil after a crop has taken its toll for a season. I used to estimate that a crop took 75 per cent the first year and about 25 per cent the following season. But after more experience and a lot of observation I find I can not tell. In the case just cited, where would the estimate come out?

I have in mind another field that was sown to onions. It was followed by sugar beets. The difference where the onions were raised with a heavy fertilizer application was plainly seen for the whole season. In fact the owner was afraid, until he came to lift the and top the beets, that he would have all tops and no roots to the beets. However, I think he got about 14 tons to the acre. Potatoes followed that beet crop and still there was some difference.

There are two things that I learn from this sort of experience and observation. One is that there is no likelihood that a crop will use 100 per cent of the fertilizer the first year, and the second is that the larger applications of fertilizer pay the best. The application of 100 pounds of 16 per cent acid phosphate to the acre will not be very noticeable the next year, though there will be some evidence of course. I am coming to believe that the application of less than 200 pounds

of any fertilizer to the acre pays a small dividend. I know that I am getting a better return on my investment since I have been using the bigger applications. I believe we farmers are just beginning to use commercial fertilizer intelligently. However, I don't care to detract anything from the value of clovers and manure as maintainers of soil fertility. They have their place but the place is bigger and more important if it is emphasized by the use of commercial fertilizers.—Earl Rogers.

These days Will Prosper is selecting his seed corn, his brood sows, and his fence posts for next spring, while his neighbor, Bill Thriftless, is sitting in the small town barber shop selecting the next cabinet for Mr. Harding.

Then there is an Atchison man who is so disagreeable that if he were to commit a crime he would wait until five minutes after press time to do it.—Carl Brown.

Entered as second-class matter at the postoffice at Philadelphia, Pa., under the act of March 3, 1879.

Member Standard Farm Paper Ass'n and Audit Bureau of Circulations

PHILADELPHIA, PA., FEBRUARY 12, 1921.

VOLUME 49 NUMBER 7

OUR JOB is to serve our readers. Whenever you are puzzled, write to us and we will help you if we can.
—The Editors

Wars are not paid for at the time—the bill comes later—Benjamin Franklin

Farm Bureau Activity

INFORMATION coming to this office shows that the activities being directed towards increasing the membership in farm bureaus are bringing results. The campaign in New Jersey is progressing very satisfactorily and thousands are being enrolled. In Delaware there is a state wide interest and the movement is enrolling a larger number of farmers than were ever before organized for one purpose. Several counties in Pennsylvania are organizing upon a paid membership basis and the indications are that the plan will become very general before the year is out.

Daylight-Saving Referendum

ANY UNCERTAINTY as to the attitude of farmers on the question of the so-called daylight saving proposition may be promptly dissipated by seeing the flood of letters and petitions against the plan now being received by Pennsylvania Farmer. Never before have we received such a response to an inquiry as comes from the blank referendum published in our issue of January 29. Within one week after the paper was mailed we received thousands of names protesting against the daylight-saving plan and not a single one in favor of it, altho we agreed to present the pleas of proponents as well as those of opponents. In scores of instances the blank was not only filled but additional paper was added and long lists of names were secured. One man writes that he took the referendum blank to a public sale, tacked it on the side of a barn and placed blank paper beneath. One hundred and three names were added without solicitation.

A bill has been presented to the Pennsylvania Legislature which would establish daylight saving in the state from April to September. Repeal bills have been offered in the Legislatures of New York and New Jersey. We shall be glad to make the best possible use of the opposing petitions by presenting them personally to the leaders or committees in all the states where they will be most effective.

Help Your College

IT IS unfortunate that an institution as vital to the people of Pennsylvania as is State College should be compelled to go before the Legislature every two years and plead for money. But since no other means of providing funds for its existence has yet been devised it is duty of the

Pennsylvania Farmer

farmers to assist the authorities in impressing the state officials with the need of generous support, at least so far as the agricultural college and experiment station is concerned. Farmers who have been to the many instructive gatherings at State College and have seen what is being done have been impressed with the need of larger funds to carry out the work successfully, and to provide for the thousands of boys and girls who wish to prepare themselves for successful life in the country. No institution in the state has done more for all the people of the Commonwealth than the experiment station, yet the niggardly sums appropriated have not enabled them to carry out more than a fraction of what could and should be done.

Farmers should throw the weight of their influence in favor of granting what the officials ask. We believe they are to be relied upon to know what should be done and to spend the money advantageously.

The Emergency Tariff Bill

THE MORE or less farcical hearings which are being held in Washington on the emergency tariff bill bring out some humorous inconsistencies. One of the most evident features is the fact that every industry and every product needs quick and special attention to save it from ruin, altho the bill was hatched for the ostensible purpose of affording relief to certain agricultural products to prevent further price reductions. One of the witnesses before the committee was a clothing manufacturer from New York who pleaded with tears in his voice for protection in the clothing business, while at the same time he opposed placing a duty on wool. At this writing there seems small prospect of the emergency tariff bill passing at this session. It is very probable that the whole matter of tariff revision will be left to the special session which will probably be called by Mr. Harding after he is inaugurated. When the matter comes up at that time it is probable that some farm leaders who have been especially insistent during the past two months may find that they were nibbling at a baited hook.

Swindlers and Thugs

THE PAPERS are full of stories giving accounts of how people are relieved of their money and valuables. Some of these human vultures use a blackjack, render their victim unconscious and go thru his pockets. Others use a wiley tongue, put their victim's good sense out of commission and sell them some worthless stock or securities.

A reader of Pennsylvania Farmer living in Maryland writes that one of the latter brand of hold-up men was doing business lately in his community. He gave his residence as Philadelphia and his mission was to organize the farmers into a co-operative marketing association; membership fee, \$25. He pretended that he had a five-year contract with leading city hotels to furnish them produce at good prices. It is estimated that he took \$500 out of that community.

Looking at it from a distance you will say, "How could farmers be so foolish?" But something similar has been done at some time in nearly every community. It is the ability of a glib tongue to overcome the better sense of a credulous but greedy mind. In spite of all the admonition to beware of the schemes of strangers, crooks continue to do business. There may be some cheap notoriety and glory in being black-jacked, but there is absolutely none in being enchured.

Advertising Products

PENNSYLVANIA FARMER has for years advocated the practice of advertising the products of the farm and of individual farms. This is an age of advertising and intelligent readers scan the advertising columns quite as carefully as they do the editorial matter. Direct selling is especially practicable here in the East where most farmers are within easy auto distance of good markets. All that is necessary is to make it generally known what is for sale, and if it is established that the products are of good quality and well graded little trouble is experienced in

finding buyers. We have a good story illustrating the success of this plan on a farm in southeastern Pennsylvania which we will publish soon.

The Director of Markets of New Jersey urges the practice of advertising upon farmers in these words: "The time has come in the farming industry when the grower must look as carefully to the marketing of his goods as he does to the growing of them. In many localities newspaper advertising offers the opportunity of a direct sales route from the farm to the kitchen of the consumer for fresh fruit, vegetables, poultry and dairy products."

Use the Lead Pencil

YOU CAN buy a good lead pencil for five cents. A tablet of blank paper can be purchased for ten cents; total, fifteen cents.

The attention of the average mind on the average farm, if given to using these items frequently, will bring greater returns than spending all the time wearing out the grindstone. If ever there was a more unjustifiable excuse given for not keeping accounts than the one, "I haven't time," we do not know of it. But it is not only in keeping books that the average farmer falls down. He fails too often to use his lead pencil in advance of a decision. By using known facts and available data it is usually possible to figure out in advance whether it is wise to continue a given course or to take up a different one. It is the men who use their pencils and scratch paper who lead in every community.

Last year some farmers neglected to sow the usual amount of grass seed because seed was unusually high in price, so their fields are bare and they will be short of hay. Figuring it down to the cost of seed per acre would have showed how foolish they were to neglect it. A few let their harvest spoil because labor was high and unavailable. The pencil would have proven machinery a good investment. All other business is done on the basis of an estimate made beforehand. While farming has many uncertain factors, this should not eliminate the necessity for making careful calculations to find what is the most economical course to pursue.

Keep a pencil handy and keep its point hot.

Our Washington Letter

The House Committee on Agriculture, after a lengthy discussion of the Gronna packer regulation bill, recently passed in the Senate, refused to grant any more hearings on the bill, and a motion to substitute a House bill for the Senate measure was defeated.

Friends of the big-five packers claim that the Senate bill, if it should become a law, would include under its provisions every one that has anything to do with the preparation of live stock products, tanners, shoe manufacturers, wool and clothing manufacturers, creameries and cheese factories, subjecting them to the same general regulation as that provided for the meat packers. Friends of the Senate bill assert that no such construction is justified.

Knowing that a single amendment would throw the bill into conference if it passed the House, and thereby secure its failure, owing to the few days left of the session, enemies of the measure have made repeated attempts to add amendments. Those members of the committee favoring the bill by their opposition to the amendments are as follows: Tincher of Kansas, Voigt of Wisconsin, McLaughlin of Nebraska, Hulings of Pennsylvania, Jacobway of Arkansas, Young of Texas, Lee of Georgia, and Rubey of Missouri.

Continuing his testimony before the committee on agriculture on the anti-grain gambling bills, Clifford Thorne, counsel for the American Farm Bureau Federation, said that if it was proper to interfere with the business of the Louisiana State lottery, with slavery and with pool rooms, it is right to prohibit gambling on the Chicago Board of Trade. You should ultimately eliminate selling of grain by people who do not have any grain to sell. If other industries can get along without gambling dens, the grain business can. Mr. Thorne suggested a method of insurance to replace the present hedging system. He also advocated the tax feature of the Capper-Tincher bill.

Senator Calder of New York proposes amendments to the revenue law exempting farm and home mortgages from taxation. He argues that this would make mortgages on farms more attractive as investments and thereby aid the farmers to secure loans. He says "The drift of money from the purchase of mortgages and other securities of the farmers has been so great, and is continuing at such a rate, that unless we forego our need for agricultural revival until all tax

exemptions are abolished, we must adopt temporary measures of relief."

A joint resolution is being considered by the House Committee on Agriculture, authorizing the President to require the United States Sugar Equalization Board to take over and dispose of 13,902 tons of sugar imported last year from the Argentine republic. This sugar was brought into this country by an importing firm who in turn turned it over to a distributing concern to sell to wholesalers. The deal was made on the advice of the Federal Department of Justice. After having made itself decidedly unpopular by its Louisiana sugar transaction the department evidently decided to mollify public opinion by attempting to break the market with this Argentine sugar, but unfortunately for the importers the break came too soon and left them with the sugar on their hands. According to Mr. Figg, formerly of the Department of Justice, who promoted this Argentine sugar deal, the government is under no legal obligations to reimburse the importers and dealers for their losses in the deal, but it is under moral obligation to do so. The amount involved is between two and three million dollars.

A statement has been issued by former Secretary of the Treasury Carter Glass of Virginia, giving his opinion that not a farmer in the entire country will be able to borrow a dollar from the War Finance Corporation unless actually engaged in the exporting business. The War Finance Corporation has been open for business nearly a month yet not a single exporting firm handling farm products has made application for a loan. If the farmers profit by the rehabilitation of the War Finance Corporation it is believed that it will be accomplished thru exporting concerns developed and controlled by the farm organizations.

A conference of co-operative extension work directors was held in Washington February 1-3, with nearly all the states represented. Dr. A. C. True, director of the States Relations Service, presided.

In his opening address, Secretary of Agriculture Meredith spoke of the lack of understanding of the agricultural editors, in regard to the work of the Department of Agriculture. Much of the criticism of the department is due to the failure of the editors to avail themselves of the means of keeping in touch with the department activities.

The world market situation was discussed by Professor E. C. Montgomery of the Bureau of Markets. According to Professor Montgomery trade promotion is only a small part of the foreign market service being developed in the Bureau of Markets. The principal object of the foreign market service is to summarize the world situation with regard to staple commodities. What the farmers want is a line on the future demand of the market. Information is now available which if organized, would give farmers a pretty good angle on supply and demand.

The United States is rapidly becoming an importing nation, said Assistant Secretary of Agriculture E. D. Ball. America today is shipping in more food rated in dollars than she is exporting. We shall have to develop a practical national policy if we are to keep this country a food exporting nation.—Elmer E. Reynolds.

HARRISBURG LETTER

Legislative Seeding Time.—While there are more bills in the hands of committees of the assembly now than usual at this time only or two of the big pieces of legislation have been presented and the so-called programmed bills have been very slow in making their appearance. The bills on the committee lists are largely of the kind that make the state's printing a burden. Many of them have been drawn to meet purely local conditions and some would overturn law applying to the whole state to cure a situation in which few people are interested. Other bills are frankly presented to make political capital. Unfortunately but fortunately, too, for the state government there is no way whereby the presentation of legislation can be regulated. The constitution, very wisely, it may be said, puts no check on such matters, but leaves it to the good sense of the legislators. Sometimes this quality does not always work except for the advantage of the printer and the vanity of the legislator or the man who inspires the bill. Out of close to 500 bills in hand as this is written, it may be said sixty to seventy are important, probably 100 carry appropriations, and some of those could be left off without injuring the state, and the rest bid fair to remain in committee. The real truth of the matter is there was so much talk about programs that the people in charge either did not get time to write out the bills or else wanted to see how the suggestions took with the general assembly. Now the assurance is given that the bills are to be in hand before the end of the month, including the Governor's bills; all administration measures and the various codes. After that there will be only what the English call supply bills and which are known here as appropriations.

Can Finish in April.—With these bills in hand

Pennsylvania Farmer

by March 1 and the state officials and political leaders in accord, members of the Legislature say the session can be closed with April. Sentiment in favor of adjourning before May has been growing, especially since members from a distance have found the city members disposed to hustle home Wednesdays and leave the latter half of the week go hang. With a minimum of legislation on the programs and bills well developed there are only the revenue proposition and apportionment remaining to cause discussions and a firm hand, such as used to be exercised on various other measures, can accomplish much this session. But whether the men who run things now have the courage to undertake a systematic reduction of charitable appropriation demands and to insist upon as few general laws as possible is a much discussed topic.

Crop Insurance Certain.—State Insurance Department officials have been in conference with the members of the legislative committees on insurance and say that there is no doubt but that the proposed authorization of insurance of crops against pests, frosts and other damaging elements will be enacted. There will also be some efforts to get the mutual fire insurance companies to align themselves more definitely with the state so that insurance as relates to rural communities will be along regulated lines.

Shrinkage of Values.—Figures being compiled at the Department of Agriculture indicate the shrinkage of farm values has been high in the millions. In some counties the value of livestock has shown a drop which the farmers hope will be realized by the assessors, while the crops remaining in barns have gone away down in value. The figures tell an interesting story of what has happened.

More Ready to Work.—Reports of the State Employment Bureau show a greater willingness on the part of many men connected with industries to work on the farm than has been known for half a dozen years and in central counties farmers ought to have no trouble recruiting men, provided the men can realize the difference between the country scale of wages and what used to be paid in the city. State authorities have received numerous requests for information about the dairy farmers from Holland and other countries who are looking this way and believe eventually the presence of foreign element accustomed to agriculture will go a long way toward getting the native born back to the soil.

Big Revenue Producer.—Director James Foust's report for 1920 shows the revenue from his bureau to have been over \$626,000, which is \$75,000 above the previous record. In the neighborhood of \$600,000 of this sum is believed to have come from oleomargarine licenses, which some ambitious legislators plan to abolish. If is doubtful whether the state will consent to give up either this revenue or the regulation of the substitute.

Railroads Asked to Help.—The railroads of the state have been asked by Commissioner Gifford Pinchot to get busy early this year in making safety strips along their rails in wooded sections. It is believed this plan will materially reduce forest fire causes. Incidentally, the state will have for distribution this year millions of seedling trees, and will plant more than ever. Farmers may obtain them for reforesting or for planting on land which cannot be profitably worked.

New Water Grab In.—Among the late comers in legislation is a bill which would give water companies back the right to exercise eminent domain, or take private land for water purposes, which was taken away by the Pennypacker act of 1905. This bill was defeated last session, but it is back again in influential hands, the plea being made it is needed to insure the future water supply of great communities.—Hamilton, Harrisburg.

NEW YORK LETTER

State Grange.—This body, with 1500 delegates, is in session in Utica this week. It has sent a special commission to demand a repeal of the daylight saving law at the hearing in Albany today. There are now 134,430 grange members in the state. State Master Giles in his address opposed the St. Lawrence river ship route from the lakes to the sea, as it means a total loss of the present canal. He criticized the state conservation commission as being administered in the interests of sportsmen alone. He condemned the Ralston-Nolan bill, and urged a more equitable system of taxation, with no distinction between real and personal property. He supported the department of farms and markets and urged the Grange to help it in formulating an agricultural policy.

Daylight Saving.—Merchants are seeing the doom of daylight saving and are rallying at Albany requesting that the bill be changed to permit 5 months of daylight saving instead of seven months.

Growers Advised.—The New York Central Marketing Association, composed of growers of potatoes and cabbage is now advised by the North American Fruit Exchange which is handling their products to liberate these crops at once. Hold-backs have failed to decrease the surplus on the market due to liberal importations. Shrinkage has been great, and in the case of cabbage the price

is not so good as it was last fall, now \$8 to \$8.50 per ton, not as much as its feeding value amounts to when fed to stock. Some farmers will not open their silos, as they are feeding heavily of cabbage and have quantities yet to feed. Local buyers of potatoes are offering 40 to 50 cents per bushel at loading points. The fruit exchange is quoting \$1 to \$1.10 per hundred pounds for potatoes f. o. b. and is urging careful grading. At present the market is very slow—75 per cent of sales being on consignment.

Milk Drops.—One milk producer near Lyons stepped into the distribution game and peddled milk at 12 cents, causing all the dealers of the city to make a drop of 2 cents to meet his price. Now one dealer offers milk in 5 quart lots at 10 cents a quart. This is the result of farmers entering into the matter, and is the best way to secure the rights of consumers, and to get enough milk consumed to take care of the output.

Ithaca's Milk War.—A dealers' milk war in Ithaca was precipitated when the new purchasers of the sanitary milk plant followed the League price and dropped to 13 then to 12 cents. The Syracuse milk war seems to be resulting in much good to consumers and by judicious advertising the farmers' plant is extending the use of its milk in that city.

Milk Outlook.—Despite prophesies the milk situation has not improved with the New Year. Figures show that the consumption of milk in this country has not been developed nearly so well as in European countries. It will take time to put the milk industry back on its feet again. The pooling plan is growing more rapidly of late. Madison County was at first slow to sign. It now has over 1300 signers, with the sentiment growing.

NEW JERSEY NEWS

Legislation Passed.—The following bills of interest to rural sections of New Jersey have been passed by the New Jersey House: Elliot, Essex—Amends the jury act, so as to provide that two years must elapse before a juror can serve on another jury; Roberts, Burlington—Eliminates statutory salaries in the Department of Agriculture and places the same under the standardization plan for connecting of the New Jersey Highway system with this state and Delaware; Elliot, Essex—Increasing salaries of members of volunteer fire departments from \$12 to \$25 per year; Rowland, Camden—Allows fish and game wardens to carry firearms while on duty without having permits; Owen, Morris—Authorizes the appointment of an additional fish and game warden for each county. New House bills introduced are: Guthrie, Mercer—Requires second-class counties to furnish stone to cities, towns, etc.; Blair, Atlantic—Prohibits hunters for wild deer from carrying gun of a smaller caliber than twelve gauge; Corio, Atlantic—Increases fees for justices of the peace in criminal proceedings, allowing one dollar for complaint and the taking of affidavit; Evans, Passaic—Permits juries in civil action to give verdict on vote of three-fourths of members; Stephens, Hudson—Prevents closed specifications in awarding contracts for state roads.

Among bills passed in the Senate is one permitting women to serve on election boards.

Fight Over Architect.—A bitter fight is now being waged in the Legislature over legislation that would place the Department of Architect of the State in the hands of Burdette G. Lewis, State Commissioner of Institutions and Agencies, who has charge of the buildings of the Vineland Institutions for Soldiers and Feeble-minded and other charitable institutions and penal institutions of New Jersey. It is charged that Francis H. Bent, the State Architect, has been incompetent on operations at the Vineland homes and other places. The members of the State Board of Education, however, are among some people who do not from present indications feel that such is the case, as they have adopted a resolution by which Bent is commended in his work on educational buildings in the state.

Utility Board Bill.—The bill by Senator Wallworth, of Camden, providing for the appointment of a Public Utility Commission of three members at a salary of \$12,000 per year for each member has passed the Senate and will in all likelihood pass the House. This board will take the place of the ousted commission, which despite the fact that it has appealed the move of Governor Edwards in removing them from office for neglect of duty and misconduct in office, will be relegated to the rear, if the utility bill is signed by the Governor. It is not likely that Edwards will affix his signature to the measure, however, as he has been held up for a long time by the Senate in confirming nominations sent to that body by him of five members of another utility board. If the Governor vetoes the bill, the Republican Legislature can override the veto and have a new board of a smaller number. Residents of the rural sections of the state, as well as those in the populous centres, are clamoring for a commission that will be able to function on lowering of rates of public utilities, to gas and electricity. It is well on rates relating to gas and electricity. It is claimed that too much attention is being given to politics and that the interests of the taxpayers are not being taken into consideration.—Kelly, Trenton.

Backed by 50 Years of Successful Plow-Building

FOR 50 years the Syracuse Chilled Plow Factory, an Eastern institution, has been building plows especially adapted to Eastern conditions. Syracuse plow-builders know the plow needs of Eastern farmers thoroughly, and they know how to build plows to meet these needs to best advantage.

JOHN DEERE SYRACUSE WALKING PLOWS

You will find the result of this special knowledge when you use a Syracuse Plow. You can tell by looking at a Syracuse that it is well made. You can see that the parts are strong and fit perfectly. But there is something built into it that you cannot see—something that is as much a part of the plow as its share, moldboard, or beam.

That is, its ability to do good work—every day—for years. Good work is what you expect of a plow when you buy it. Nothing else will take its place. Unless a plow does good work, you use it at a loss instead of a profit. A Syracuse Plow insures good work in the soil conditions for which it was built. It will do your plowing the way you want it done.

Tell your John Deere dealer to show you the type of Syracuse plow that suits your farm. Write us for folders describing the John Deere-Syracuse Walking Plows—general-purpose, hillside, or flat moldboard. Ask for Better Farm Implements, a 114-page book containing description and illustrations of the full line of John Deere tools. It's free. Address John Deere, Moline, Illinois, and ask for Package SW-836.

HORTICULTURE

Pruning Small Fruits

SOMETIME ago a neighbor asked me to prune his grape vine. I found a thick tangle of vines that could not develop and ripen a crop of fruit. After pruning the vine, which was a hard problem after it had been left so long, I went over his place and saw patches of blackberries, raspberries and currants that had been left to grow naturally after planting. Like the grape vine, they were clumps of new and old wood, which the owner told me had born small crops of inferior fruit. After one buys plants and fits the ground for them and does the work of planting and putting up supports, he should not lose his work, when a little pruning and care at the right time would result in plenty of fine fruit.

Many people have not made a study of pruning and have told me they would not know how to do the pruning if they should try to.

The most of the fruits should be pruned when dormant or defoliated, but some of the cane fruits may be

this to the wires above something like an inverted T, but there may be several upright stems growing from the base vine on the first wire. When the base vine is established the pruning consists in cutting back the upright vines so as to leave spurs for the new growth to start from, for the fruit is born on the new wood that grows the same year.

The tender varieties of grapes should be pruned by the renewal system. This consists in growing renewal vines before the fruiting vines get too large to lay down for winter protection. If it is the three-year renewal system the three-year old vines will be cut off after the third year and the vines which have been growing for two years will take their place for the fruiting vines. The two-year renewal system may be used when the vines get too large for laying down, in three years and the method is the same as the three-year system. With either system, put down the vines late in the fall and shorten them about one-third and

View of a Portion of New Jersey Products Show. Pennsylvania Farmer Solicitors at Left

cut back and thinned in the growing season. The hardness of fruits is a factor that may determine the method of pruning, and with some the bleeding and flow of sap the time of pruning. In my locality in southeastern New York, grapes can be safely pruned from the time the leaves are off in the fall up to the first part of April. It is better to prune early enough so there will be a searing of the wounds before the sap starts in the spring. If one lives in a locality where some varieties of grapes can be grown without winter protection he may use a plan of pruning by which the vine may be left on the trellis or wires. In my section in perhaps four years out of five years there will be injury to More's Early, More's Diamond and Delaware if left on the supports. Niagara and Winchell, I always prune by a method by which I can protect them in winter.

The most hardy grapes I train to three wires. The wires are put up the second year after planting. The top wire is six feet from the ground. In starting the vine two of the strongest vines are tied to the bottom wire. Lateral vines are trained from

prune the side shoots back to spurs. Three or four fruiting canes are enough.

Blackberries

As with grapes one needs to prune blackberries by a system adapted to the variety and the locality in which it is grown. The ideal way for the hardy kinds is to grow them in tree form. This is done by thinning the new canes which start to grow in the spring to an average distance of about one foot apart and pinch them off when two or three feet high. Side shoots then start until there is a bush in tree form. The canes are best supported by setting posts five feet high several feet apart, nailing arms to the tops about three feet long and fastening smooth fence wire to the ends of the arms which which support the canes on either side. When the canes have borne a crop it is better to cut them out and let the new one have the right-of-way.

The tender varieties of Blackberries and raspberries we can handle in the same way.

Thin the new growth in the early summer so they will not stand too thick in the rows, but do not pinch

off the tops for we do not want a stocky, thick cane for laying down. Just before the ground freezes for winter, shorten the canes about one-third, dig away the soil on one side and carefully bend them over until they lay flat on the ground. They may be pegged down with staples or held with weights. They will need only a slight covering and in most localities not any. I find it necessary to protect in this way, Rathbun and Erie blackberries, but Snyder, Eldorado, and Taylor seldom need protection. I lay down Cuthbert and Golden Queen raspberries in the same way. Blackcaps, and the purple kinds are generally hardy, except the Gregg, which can be grown by system advised for the tender blackberries.

Bush Fruits

Currants and gooseberries require only dormant pruning which is best done in the late fall but can be done anytime before leaving out. Whether one grows these by tree or bush form is a matter of taste. The bush form will produce the most fruit but the tree form is more ornamental. After three or four years from planting it is a good thing to practice renewal pruning. This is cutting back apart of the oldest wood each year so new shoots will start for bearing fruit the next year. In this way the bushes can be kept bearing well for many years.—W. H. Jenkins.

ORCHARDING IN PENNSYLVANIA

Speaking before the State Horticultural Association which met during the State Products Show, Dr. S. W. Fletcher of State College said:

"We have been the innocent victims of a combination of circumstances that is not likely to occur again in a generation. These include the war readjustment period, a presidential year, tight money, miserable transportation service, exorbitant freight rates, packages scarce and costly, very little demand for by-products and high prices for labor and supplies, which make a combination hard to beat. Other specialists and even general farmers are in the same boat. We are all caught in the readjustment web that we have known all along was being spun for us. But there are other years coming, and some of them will be good."

"Some of our people were getting too cocky. This trying season is going to be a good thing for the apple industry of Pennsylvania. The contrast between 1919 and 1920 would be tragic were it not so funny. In 1919 apple prices were high and there was nothing but rosy tinted optimism. The papers were full of tales of fortunes made in apple growing almost over night. Some orchards sold for \$1000 an acre and the 1919 crop in some sections netted that amount to the acre. Orchard stock companies sprang up like mushrooms. Some people deluded themselves into believing that an acre of apple orchard reasonably might be expected to average \$1000 an acre annually, over a series of years."

"The awakening from this Arabian Night's dream of easy riches has been painful but salutary. Some who paid big prices are wearing long faces now and their pocketbooks are flat, but their vision is clearer. This year will be worth while if it freezes out of the apple business the speculators and get-rich-quick men and leaves the industry in the hands of the bona fide growers. There is no room for weak-kneed and faint heart—(Continued on Page 22).

SUPERIOR

FOR more than half a century the big percentage of this country's grain has been sown with the Superior. And today, with either team or tractor, you find more big crop farmers than ever before placing their faith on this even-seeding, long-lived drill. An implement of time-proven worth.

For Team or Any Tractor

Superior Grain Drills combine extra strength with unusual light draft. They form even, roomy seed trenches, allowing each seed a perfect chance for quick germination and sturdy growth.

Superior Tractor Drills are equipped with a special power lift and adjustable tractor hitch. Power lift enables operator to raise or lower discs while in motion without leaving tractor seat.

Your dealer can show you the drill exactly suited in size and style for your particular needs. Ask him to explain all special features.

The American Seeding-Machine Co., Inc. Springfield, Ohio

We also manufacture Alfalfa and Grass Seed Drills, Beet and Bean Drills, Corn and Cotton Drills, Alfalfa Cultivators, Corn and Potato Planters, Broadcast Fertilizers and Lime Sowers, and Disc Harrows. Write for descriptive folders.

Apples like these from your own trees

full of the fragrance and flavor that awaken memories of youthful romps in bare-foot days. And full of profits, too, for those fore-sighted enough to plant as many apple trees as space will permit.

POULTRY

Management of Incubators

By R. G. KIRBY

THE first step in success with incubators is to obtain hatching eggs from vigorous stock that have not been forced for winter eggs. Then a well-built machine must be obtained and operated according to the manufacturer's directions. We have learned that this pays. The practical poultryman soon learns many points about artificial hatching and it is seldom necessary to use the directions after the first year. The beginner will possibly enjoy reading of the points which help to make a hatch a success regardless of the make of the machine.

Before starting a hot water machine, test it for leaks. We once found a small hole rusted in a pipe and a serious loss was averted by locating it before placing eggs in the machine. Compare the thermometer with one of known accuracy if there is any doubt of its value. Use a new wick for each hatch and avoid chances of an old wick burning too short to touch the oil.

After each hatch the egg trays should be washed in hot water and soda or a solution of one of the commercial coal tar disinfectants. Also hold the lamp burner in the hot soda water solution. It will remove the gummy material and make the wick easier to operate. Trim the lamp each morning before refilling. When the wick is first started it should be trimmed squarely across the top and then slightly rounded. After the first trimming with shears, it is only necessary to remove the burnt portions of the wick each morning by scraping with a match.

We find that the grade of kerosene is an important factor in maintaining an even temperature in an incubator. We buy the best grade obtainable and find it gives more heat for the money and less odor and soot. Before placing the eggs in the machine it pays to run it for a day and be sure that the thermostat is adjusted as advised by the maker. It should be adjusted so that too high flame on the lamp is not necessary to keep the heat in the machine up to 103 degrees. After the adjustment is made it need not be changed if everything is right but all other increases or decreases in temperature can be made by turning the wick.

The eggs should be turned morning and night from the morning of the third day to the night of the eighteenth day. Remove a few eggs from the center of the tray and roll the others toward the center. Then replace the eggs in the end. This keeps the eggs constantly changing in their place in the machine and all will receive a certain amount of turning.

It is not necessary to mark each egg to be sure that it is turned completely over each time. We have had better results when the eggs have been cooled a little whenever they are turned. This is nature's way and the old hens which cool their eggs obtain fine results. As the hatch progresses they need more cooling. Touch the egg to the eye and when that sensitive point tells that the egg is just barely cool, it is time to replace the trays in the egg chamber.

The first time we operated an incubator we made a chart and labeled it "What to do each day." After following the chart carefully thru the progress of one hatch the lesson was learned and directions not needed again. Test the eggs on the seventh and fourteenth. On the seventh day remove the clear eggs which are infertile and any that show a dead germ. On the fourteenth day remove any that were doubtful on the seventh or that have died since that time. The eggs that look very dark and seem a little warm with animal heat, will be the ones that contain rapidly growing chicks.

The best location for an incubator is in a cellar but it can be managed in a room that is not too close for a stove. Success in an upstairs room is more difficult but good results can be obtained. The temperature of the air in the room must be as uniform as possible as the air is constantly flowing thru the machine and thus the heat in the egg chamber is influenced by the temperature of the outside room. If an incubator is near a stove the machine may overheat when the stove is burning hard and then cool off rapidly when the fire goes down at night.

Vibrations on the floor and heavy jars in walking must be avoided if the incubator is not in a cellar. The slamming of doors may do serious injury to the eggs. All the family must help by being very careful when the incubator is operated in an upstairs room. The machine should be leveled with a spirit level before starting. The highest point will be the warmest so a level machine is necessary to have the temperature uniform at the level of the eggs.

Some breeders of poultry run their incubators as near as possible to 103 degrees thruout the hatch. Others use 102 degrees the first week, 102½ degrees the second, and 103 degrees the third. We have tried both ways with about equal results. In general it pays to keep the machine just as near to 103 degrees at all times as is possible. A few degrees low for a few hours will do no damage. But do not let the lamp creep up and overheat the eggs. A temperature four or five degrees too high causes a lot of trouble. Overheated eggs do not hatch well and the chicks that do emerge are apt to be thin and lacking in vitality. On the other hand the eggs can sometimes cool quite a bit over a period of several hours without destroying the germ. Of course changes are not desirable and the best results come when the temperature is right thruout the hatch. It is not possible to keep it right on the dot and operator should not constantly worry about the thermometer. Good machines are not hard to regulate and they are not apt to overheat if the lamp is given proper attention and the thermostat is properly adjusted.

We find one of the great advantages of early hatching is the fact that incubators are easier to operate

in cool weather than during the hot days of late spring or early summer. If the temperature becomes about 100 degrees outside it means constant watching and regulation of the machine to keep the eggs from overheating. Then a cellar is needed to produce good hatches.

When the hatch reaches the night of the eighteenth day we soak woolen cloths in boiling water, then wring them out and place them on the eggs. Then the trays and the cloths are returned to the egg chambers. The cloths will be found nearly dry the next morning and are removed. We believe that supplying this additional moisture has helped us to obtain larger hatches by reducing the number of chicks not strong enough to break the membrane and pick out of the shell.

When the cloths are removed, close the machine. Do not open it again for any purpose until the hatch is completed. When the chicks are dry and the hatch seems finished, open the machine and take out the chicks. Large day-old chick boxes are handy to hold the chicks while the machine is being emptied. We have found no value in removing the shell and membrane from chicks that have not had strength to come out for themselves. Such chicks are apt to be crippled or weak and of little value. It is rather tough to have to kill the cripples if there are any but it is only humane to do it at once and keep only the young birds that are thrifty.

Any chicks that have died in the shell should be at once burned or buried. The shells from the chicks that have hatched can be crumpled up and placed where the hens can eat them. Then the healthy chicks can be placed back in the machine and left until old enough to feed. We find good results come from feeding when the average of the flock are about fifty hours old. Some will be older and some younger but practically all the good chicks will be old enough to have the egg yolk absorbed. Then feeding will not cause bowel trouble and death if other conditions are right.

It pays to place a cloth or paper over a glass door incubator with thumb tacks if the chicks remain in the machine after the hatch is completed. They soon become very hungry and active and in the light they will constantly pick each other. When in the dark they will sprawl out and sleep and gain strength to eat and scratch when they reach the brooder house.

POULTRY WEEK AT THE PENNA. STATE COLLEGE

The week of March third to tenth is to be poultry week at the Pennsylvania State College. Intensive courses of instruction will be offered in all phases of poultry work. The exercises have been planned primarily to furnish the practice needed to round out the courses being given to the correspondence students, but other residents of the state will be admitted. The program has been arranged to include exercises in the care and use of incubators and brooders, in computing poultry rations, grading eggs, dressing fowls, culling for egg production, and in the diagnosis of poultry diseases. All applicants for admission to the courses should have some prior knowledge of the subject. Those who wish to enroll should send their name to Mr. T. I. Mairs, Director of Correspondence Courses in Agriculture and Home Economics, State College, Pa.

Condition Your Breeders

Mating Time Is Here

Make sure that the parent stock, your hens and roosters, are in the pink of condition at mating time.

Then they will impart health and vigor to the offspring. See to it that your breeders receive in their daily ration

Dr. Hess Poultry PAN-A-CE-A

It puts the Breeders in Fine Condition

You get strong livable chicks.—Chicks with power of resistance—Chicks that will not fall a prey to every little-chick ailment—Chicks that will develop into early broilers—Pullets that will develop into fall and winter layers.

SPEED UP EGG PRODUCTION during winter with Dr. Hess Poultry Pan-a-ce-a. It contains tonics that promote a hen's digestion, tonics that tone up the dormant egg organs—so that the proper amount of food goes to egg production—and not all to flesh and fat and laziness—when it's action and eggs you want.

Always buy Pan-a-ce-a according to the size of your flock. Tell your dealer how many hens you have. He has a package to suit. Good results guaranteed.

30c, 75c and \$1.50 packages. 25 lb. pail, \$3.00. 100 lb. drum, \$10.00. Except in the far West and Canada.

MAKING THE KITCHENS HANDIER

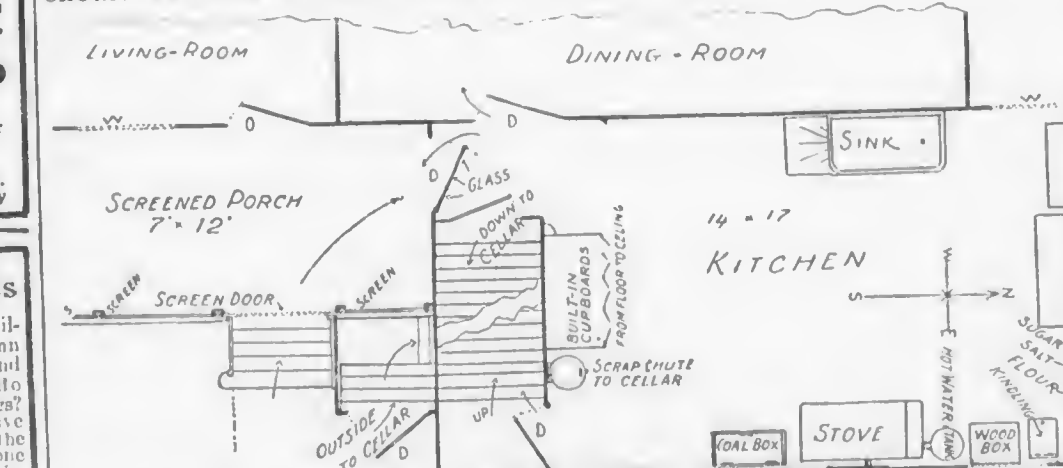

Kitchen of Mrs. Cass Before (at left) and After (at right) She Had It Rearranged

How Mrs. Cass Fixed Hers
Sometime ago we made the change in our kitchen illustrated herewith. By taking out the partition between the meal room and the pantry we got a very convenient dining-room, with a door into the kitchen at either end. But cutting a hole into the side of the chimney flue we were able to set the range back against the wall. This not only did away with the troublesome cubbyhole back of the stove, but also gave me more room in the center of the kitchen. Then we put in a water system, and have the hot water tank next to the firebox of the stove so that it can be heated without too long a pipe from the firebox to the tank. On the other side of the wall from the tank is the bathroom, hence the hot water does not have far to go to reach the bathtub.

Mrs. Reagan's Kitchen Before (at left) and After (at right) She Moved Things Around and Thus Saved Steps

I find that this arrangement of my kitchen permits me to do my kitchen work with much less fatigue than with the old arrangement, because I have less traveling. Notice where we have an elevator or dumb waiter. This water lets down level with the kitchen floor, so that when the work is done, I can push the work table over the elevator.
Notice that I have a fireless cooker at the right of the elevator. I think that a fireless cooker and an oil stove should be in every farm kitchen. It

The Mistress of This Big, Old-fashioned Kitchen Solved the Step-making Problem by Moving the Equipment All to One End of the Room, and She Had the Porch Screened

This Changes Your TUB INTO A Washing Machine

This attachment immediately transforms your wash tub into the most efficient washing machine for only \$12.00. It washes blankets or lace clean, quickly, easily, by the suction principle. A lever does the work. Two vacuum cups turn above the water and take different position on every stroke forcing the soapy water gently through the mesh. No dragging, rubbing, or wear of clothes. Very simple, light, portable, durable. By reversing lever it rinses clothes in sudsy tub. Guaranteed for 1 year. Interesting literature free.

Venice Center.

First a four-paned glass door was put in the south side. Two panels were cut from a north door, and window panes, 36 by 10 1/2 inches, were put in. We moved the cupboard (CB) over by the dining table (DT), and painted it inside and out a grayish white to match the color that I had painted the kitchen woodwork, which had before been an ugly cinnamon brown. I also put light-colored paper on the walls.

All everyday dishes and cooking utensils were kept in the cupboard instead of in the pantry, as my predecessor had done. The old woodbox (WB) was put in the backroom for chunks in winter, and we put a heavy hinge cover and castors on a good strong box, painted the sides to match the other paint of the kitchen, and tacked a padded cretonne cushion on top. We put this woodbox back of the stove where the cupboard had stood in the old arrangement. Thus I had a seat and a woodbox combined.

The water was piped into the kitchen from a pump (P) or a large galvanized tank (GT) outside. You can imagine the steps that those few feet of 1-inch pipe saved me. It took only a few hours of work one day of three men to put in this piping. The water was piped to a new sink, 20 by 30 inches (SH), which had a drain pipe, and drain shelf at one end. The water pipe went on out to the barn into a tank. The sink was placed on brackets back of the old glass door where the old woodbox had stood. A wood bench (BE) on which formerly a water pail and a wash basin had been kept, vanished.

After the pantry and hall were fixed into a dining room, we added a kitchen cabinet (KC) to my kitchen equipment. It has a nickeloid sliding top, a ventilated bread box, removable flour bin, which will hold 40 lbs., a 10-lb. sugar jar, and jars for tea, coffee, salt, spices and everything that one needs to get a meal, except the fruit, vegetables, milk and meat.

The work of fixing up this kitchen was all done without hiring extra help, and the cost was as follows: Pipe, 50 feet, 50 cents; faucet, 40 cents; sink, \$2.25; glass door, \$2.40; brackets for sink, 40 cents; woodbox hinges and castors, 38 cents; kitchen cabinet, \$25. Total, \$34.33. It would cost more now, but even so, it would be well worth it in the saving of my steps, time and strength.—Mrs. Frank Reagan, Cortland County, New York.

APPLE JELLY

Why do not more country people patronize the local jelly factory where apple jelly is made? We took about 13 bushels of surplus apples to the factory last fall and got 9 gallons of lovely jelly. When I want a jelly cake I have only to stir up a common plain cake (fairly rich), bake it in layers, spread them generously with jelly and sprinkle the top with sugar. We eat jelly on our pancakes every morning. It is fine with hot biscuits for supper, and indeed we find innumerable ways of using it. We paid 75c per gallon for making and the finished product sells for \$1.50. Better get some next year.—E. M. A.

Affording things is largely a matter of the way you look at it. The farm that can afford modern tools and equipment can afford running water in the house and a sewage system.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3472.—Chemise Style Dress.—This is good for slender figures. The pattern is cut in 3 sizes: 16, 18 and 20 years. A 16-year size will require 4 yards of 44-inch material. The width of the skirt at the foot is 2 yards. Serge with embroidery or braiding, velvet, satin, duvetyne, tricotine or twill could be used for this dress. The "apron" panel is a very smart feature. Pattern, 10 cents.

3492.—Unique Frock.—The pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38-inch size will require 5 1/2 yards of 40-inch material. The width of the skirt at its lower edge is 2 yards. Serge, duvetyne, broadcloth, tweed, plaid or check suiting are good materials for it. Braid or embroidery will form an attractive trimming, and a string belt or cord girdle may confine the fulness at the waistline. Pattern, 10 cents.

3369.—Unique and Stylish.—The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38-inch size will require 6 1/2 yards of 36-inch material. The width of the skirt at lower edge is about 1 1/2 yard. Braid and embroidery is here used for a decoration on serge. Pattern, 10 cents.

3388.—Dress for Growing Girl.—The pattern is cut in 3 sizes: 12, 14 and 16 years. A 14-year size requires 3 1/2 yards of 36-inch material. Blue serge with trimming of plaid woolen would be attractive for this dress. It is equally suitable for gingham, poplin, percale, taffeta, velvet and gabardine. Pattern, 10 cents.

In many a farm home the real family gathering place is the kitchen, especially in the winter. That's another reason why it should be bright and cheerful. Light colored paint helps a lot.

Those greens that you canned last spring taste mighty good now, don't they? How about a few more more cans next season?

Crushed stone and water —and a machine to mix them

THAT is Colt Carbide Lighting-and-Cooking reduced to its simplest terms. And what a wonderful combination! The Colt machine brings carbide (crushed stone) and water together, producing a marvelous gas.

This gas produces the hottest cooking-flame known; and a light that is seemingly a miniature of that great orb that rises in the east and sinks in the west.

Cook and Illuminate with a Colt

The Colt Carbide Lighting-and-Cooking Plant drops a handful of carbide intermittently into a self-contained tank of plain, ordinary water. The water releases the gas from the impregnated stone, and there you are!

There is no waste. The Colt machine shuts off automatically as you draw upon it for fuel and light. The carbide residue is slaked lime, good for fertilizer. Picture a cool, sweet kitchen, even in sweltering summer, made possible by carbide fuel for the gas-range, the hot-plate and the flat-iron.

Picture your house, barns, outbuildings and driveways a blaze of radiant glory in the pitch black of the country night. And the little old Colt machine making gas as you need it, with the ease and dignity of the old-fashioned windmill!

You want to know what it costs and all about it. We'll tell you gladly, if you'll just send us your name and address on a postcard. Do that.

SYNOPSIS

Dan Failing had just received from his physician the unwelcome information that he had but six months to live. Altho descended from a long line of hardy pioneers, his life had been spent in the city where confinement in an office had destroyed the physical foundation which his forebears had laid. He strolled out to the city park, seated himself on a bench where he made the acquaintance of a squirrel. The squirrel's antics awoke of Nature and he suddenly resolved to spend his last six months in the forests of the Northwest where his grandfather had lived. He set at once upon this resolve and he is soon in the virgin forests of that great country. He is fortunate in becoming an inmate of a home owned by a man who knew and loved Dan's grandfather. A daughter, nicknamed Snowbird, is also a member of the family.

CHAPTER VI

"FOUGHT! I would have fought till I died! But that isn't enough, Snowbird. It isn't enough just to fight, in a case like this. A man's got to win! I would have died if you hadn't come. And that's another debt that I have to pay—only that debt I owe to you."

She nodded slowly. The lives of the mountain men are not saved by their women without incurring obligation. She attempted no barren denials. She made no effort to pretend he had not incurred a tremendous debt when she had come with her pistol. It was an unavoidable fact. A life for a life is the code of the mountains.

"Two things I must do, before I can dare to die," he told her soberly. "One of them is to pay you; the other is to pay Cranston for the thing he said. Maybe the chance will never come for the first of the two; only I'll pray that it will. Maybe it would be kinder to pay to pray that it wouldn't; yet I pray that it will! Maybe I can pay that debt only by being always ready, always watching for a chance to save you from any danger, always trying to protect you. You didn't come in time to see the fight I made. Besides—I lost, and little else matters. And that debt to you can't be paid until sometime I fight again—for you—and win." He gasped from his weakness, but went on bravely. "I'll never be able to feel at peace, Snowbird, until I'm tested in the fire before your eyes! I want to show you the things Cranston said of me are not true—that my courage can stand the test."

"It wouldn't be the same, perhaps, with an eastern girl. Other things matter in the valleys. But I see how it is here; that there is only one standard for men and by that standard they rise or fall. Things in the mountains are down to the essentials."

He paused and struggled for strength to continue. "And I know what you said to him," he went on. "Half-unconscious as I was, I remember every word. Each word just seems to burn into me, Snowbird, and I'll make every one of them good. You said I am a better man than he, and sometime it would be proved—and it's the truth! Maybe in a month, maybe in a year. I'm not go-

The Voice of the Pack

by Edison Marshall

ing to die from this malady of mine now. Snowbird. I've got too much to live for—too many debts to pay. In the end, I'll prove your words to him."

His eyes grew earnest, and the hard fire went out of them. "It's almost as if you were a queen, a real queen of some great kingdom," he told her, trembling with a great awe that was stealing over him, as a mist steals over water. "And because I had kissed your fingers, for ever and ever I was your subject, living only to fight your fights—maybe with a dream in the end to kiss your fingers again. When you bent and kissed me on that hillside—for him to see—it was the same; that I was sworn to you, and nothing mattered in my life except the service and love I could give to you. And it's more than you ever dream, Snowbird. It's all yours, for your battles and your happiness."

The great pines were silent above them, shadowed and dark. Perhaps they were listening to an age-old story, those vows of service and self-gained worth by which the race has struggled upward from the darkness.

"But I kissed you—once before," she reminded him. The voice was just a whisper hardly louder than the stir of the leaves in the wind.

"But that kiss didn't count," he told her. "It wasn't at all the same. I loved you then, I think, but it did not mean what it did today."

"And what—" she leaned toward him, her eyes full on his, "does it mean now?"

"All that's worth while in life, all that matters when everything is said that can be said, and all is done that can be done. And it means, please God, when the debts are paid, that I may have such a kiss again."

"Until then, I make oath that I won't even ask it, or receive it if you should give it. It goes too deep, dearest—and it means too much."

This was their past. Not until the debts were paid and her word made good would those lips be his again. There was no need for further words. Both of them knew. The soldier of the queen must be tried with fire, before he may return to kiss her fingers. The light burns clear in this. No instances of degeneracy, no exceptions brought to pass by thwarted nature, can affect the truth of this.

In the skies, the gray clouds were gathering swiftly, as always in the mountains. The raindrops were falling one and one, over the forest. The summer was done, and fall had come in earnest.

CHAPTER VIII

The rains fell unceasingly for seven days; not a downpour but a constant drizzle that made the distant ridges smoke. The parched earth seemed to smack its lips and the little rivulets began to fall and tumble over the beds of the dry streams. The Rogne and the Umpqua flooded and the great steelhead began to ascend their smaller tributaries. Whisperfoot hunted with ease, for the wet shrubbery did not crack and give him away. The air was filled with the

call of the birds of passage.

All danger of forest fire was at once removed, and Snowbird was no longer needed as a lookout on old Bald Mountain. She went to her own home, her companion back to the valley; and now that his sister had taken his place as housekeeper, Bill had gone to the lower foothills with a great part of the live stock. Dan spent these rainy days in toil on the hillsides, building himself physically so that he might pay his debts.

It was no great pleasure, these rainy days. He would have greatly liked to have lingered in the square mountain house, listening to the quiet murmur of the rain on the roof and watching Snowbird at her household tasks. She could, as her father had said, make a biscuit. She could also roll up her sleeves over trim, brown arms and with entire good humor do a week's laundry for three hardworking men. He would have liked to sit with her, thru the long afternoons, as she knitted beside the fireplace—to watch the play of her graceful fingers and perhaps, now and then, to touch her hands when he held the skeins. But none of these things transpired. He drove himself from daylight till dark, developing his body for the tests that were sure to come.

The first few days nearly killed him. He over-exercised in the chill rain, and one anxious night he developed all the symptoms of pneumonia. Such a sickness would have been the one thing needed to make the doctor's prophecy come true. But with Snowbird's aid, and numerous hot drinks, he fought it off.

She had made him go to bed, and no human memory could be so dull as to forget the little, whispered message that she gave him with his last spoonful of medicine. She said she'd pray for him, and she meant it too—literal, entreating prayer that could not go unheard. She was a mountain girl, and her beliefs were those of her ancestors—simple and true and wholly without affectation. But he hadn't relaxed thereafter. He knew the time had come to make the test. Night after night he would go to bed half-sick from fatigue, but the mornings would find him fresh. And after two weeks, he knew he had passed the crisis and was on the direct road to complete recovery.

Sometimes he cut wood in the forest: first the felling of some tall pine, then the trimming and hewing into two-foot lengths. The blisters came on his hands, broke and bled, but finally hardened into callouses. He learned the most effective stroke to hurl a shower of chips from beneath the blade. His back and limbs hardened from the handling of heavy wood—and the cough was practically gone.

Sometimes he mended fences and did other manual labor about the ranch; but not all his exercise was taken out in work. He didn't forget his friends in the forest, creatures of talon and paw and wing. He spent long days roaming the ridges and fighting thru the buckbrush, and the forest yielded up its secrets, one by one. But he knew that no mortal span of years was long enough to absorb them all. Sometimes he shot ducks over the marshes; and there was no greater sport for him in the wilds than the first sight of a fine, black-pencill line upon the distant sky, the leap thru the air that it made until in an instant's flash, it evolved into a flock of mallard passing with the wind; and then the over the sights.

His frame filled out. His face became swarthy from constant exposure. He gained in weight. A month glided by, and he began to see the first movement of the largest forest creatures down to the foothills. For not even the animals, with the exception of the hardy wolf pack, can survive if unprotected from the winter snow and cold of the high levels. The first snow sifted from the gray sky and quickly melted on the wet pine needles. And then the migration of the deer began in earnest. Before another week was done, Whisperfoot had cause to marvel where they had all gone.

One cloudy afternoon in early November found Silas Lennox cutting wood on the ridge behind his house. It was still an open question with him whether he and his daughter would attempt to winter on the Divide. Dan of course wanted to remain, yet there were certain reasons, some very definite and others extremely vague, why the prospect of the winter in the snow fields did not appeal to the mountaineer. In the first place, all signs pointed to a hard season. Although the fall had come late, the snows were exceedingly early. The duck flight was completed two weeks before its usual time and the rodents had dug their burrows unusually deep. Besides, too many months of snow weigh heavily upon the spirits. The wolf packs sing endlessly on the ridges, and many unpleasant things may happen. On previous years, some of the cabins on the ridges below had human occupants; this winter the whole region, for nearly seventy miles across the mountains to the foothills, would be wholly deserted by human beings. Even the ranger station, twelve miles across a steep ridge, would soon be empty. Of course a few ranchers had homes a few miles beyond the river, but the wild cataracts did not freeze in the coldest of seasons, and there were no bridges. Besides, most of the more prosperous farmers wintered in the valleys. Only a few more days would the road be passable for his car; and no time must be lost in making his decision.

Once the snows came in reality, there was nothing to do but stay. Seventy miles across the uncharted ridges on snowshoes is an undertaking for which even a mountaineer has no fondness. It might be the wisest thing, after all, to load Snowbird and Dan into his car and drive down to the valleys. The fall roundup would soon be completed, Bill would return for a few days from the valleys with new equipment to replace the broken lighting system on the car, and they could avoid the bitter cold and snow that Lennox had known so long. Of course he would miss it somewhat. He had a strong man's love for the endless drifts, the crackling dawns and the hushed, winter forest wherein not even Woof or Whisperfoot dares to go abroad. He chopped at a great log and wondered what would suit him better—the comfort and safety of the valleys or the rugged glory of the ridges.

But at that instant, the question of whether or not he would winter on the Divide was decided for him. And an instant was all that was needed. For the period of one breath he forgot he was watchful—and a certain dread Spirit that abides much in the forest saw its chance. Perhaps he had lived too long in the mountains and grown careless of them; an attitude that is usually punishable with death. He had just felled a tree, and the trunk was still attached to the stump by a strip of bark to which a

little of the wood adhered. He struck a furious blow at it with his ax.

He hadn't considered that the tree lay on a steep slope. As the blade fell, the great trunk simply seemed to leap. Lennox leaped too, in a frenzied effort to save his life; but already, the leafy bows, like the tendrils of some great amphibian, had whipped around his legs. He fell, struggling; and then a curious darkness, streaked with flame, dropped down upon him.

An hour later he found himself lying on the still hillside, knowing only a great wonderment. At first his only impulse was to go back to sleep. He didn't understand the grayness that had come upon the mountain world, his own strange feeling of numbness, of endless soaring thru infinite spaces. But he was a mountain man, and that meant he was schooled, beyond all things, to keep his self-control. He made himself remember. It was the cruellest work he had ever done, and it seemed to him that his brain would shiver to pieces from the effort. Yes—he had been cutting wood on the hillside, and the shadows had been long. He had been wondering whether or not they should go down to the valleys.

He remembered now: the last blow and the rolling log. He tried to turn his head to look up to the hill.

He found himself wholly unable to do it. Something wracked him in his neck when he tried to move. But he did glance down. And yes, he could turn in this direction. And he saw the great tree trunk lying twenty feet below him, wedged in between the young pines.

He was surrounded by broken fragments of limbs, and it was evident that the tree had not struck him a full blow. The limbs had protested him to some extent. No man is of such mold as to be crushed under the solid weight of the trunk and live to remember it. He wondered if this were the frontier of death—the grayness that lingered over him. He seemed to be soaring.

He brought himself back to earth and tried again to remember. Of course, the twilight had fallen. It had been late afternoon when he had cut the tree. His hand stole along his body; and then, for the first time, a hideous sickness came upon him. His hand was warm and wet when he brought it up. The other hand he couldn't stretch at all.

The forest was silent around him, except a bird calling somewhere near the house—a full voice, rich and clear, and it seemed to him that it had a quality of distress. Then he recognized it. It was the voice of his own daughter, Snowbird, calling for him. He tried to answer her.

It was only a whisper, at first. Yet she was coming nearer; and her own voice sounded louder. "Here, Snowbird," he called again. She heard him then: he could tell by the startled tone of her reply. The next instant she was at his side, her tears dropping on his face.

With a tremendous effort of will, he recalled his speeding faculties. "I don't think I'm badly hurt," he told her very quietly. "A few ribs broken—and a leg. But we'll have to winter here on the Divide. Snowbird mine."

"What does it matter, if you live," she cried. She crawled along the pine needles beside him, and tore his shirt from his breast. He was rapidly sinking into unconsciousness. The thing she dreaded most—that his back might be broken—was evidently not true. There were, as he

said, broken ribs and evidently one severe fracture of the leg bone. Whether he had sustained internal injuries that would end his life before the morning, she had no way of knowing.

At that point, the problem of saving her father's life fell wholly into her hands. It was perfectly plain that he could not aid himself in the slightest way. It was evident, also, he could not be moved, except possibly for the distance to the house. She banished all impulse toward hysteria and at once began to consider all phases of the case.

His broken body could not be carried over the mountain road to physicians in the valleys. They must be transported to the ranch. It would take them a full day to make the trip, even if she could get word to them at once; and twenty-four hours without medical attention would probably cost her father his life. The nearest telephone was at the ranger station, twelve miles distant over a mountain trail. The telephone line to Bald Mountain, four miles off, had been disconnected when the rains had ended the peril of the forest fire.

It all depended upon her. Bill was driving cattle into the valleys, and he and his men had in use all the horses on the ranch with one exception. The remaining horse had been ridden by Dan to some distant marshes, and as Dan would shoot until sunset, that meant he would not return until ten o'clock. There was no road for a car to the ranger station, only a rough steep trail, and she remembered, with a sinking heart, that one of Bill's missions in the valley was to procure a new lighting system. By no conceivable possibility could she drive down that mountain road in darkness. But she was somewhat relieved by the thought that in all probability she could walk twelve miles across the mountains to the ranger station in much less time than she could drive, by automobile, seventy miles down to the ranches at the foothills about the valley.

He was stirring a little now. Evidently consciousness was returning to him. And then she thanked Heaven for the few simple lessons in first aid that her father had taught her in the days before his carelessness had come upon him. He had been wise enough to know that rare would be her fortune if sometime she did not have need of such knowledge.

One of his lessons had been that of carrying an unconscious human form—a method by which even a woman may carry, for a short distance, a heavy man. It was approximately the method used in carrying wounded in No Man's Land: the body thrown over the shoulders, one arm thru the fork of the legs to the wounded man's hand. Her father was not a particularly heavy man, and she was an exceptionally strong young woman. She knew at once that this problem was solved.

The hardest part was lifting him to her shoulders. Only by calling upon her last ounce of strength, and tugging upward with her arms, was she able to do it.

It was a distance of one hundred yards in all. No muscles but those trained by the outdoors, no lungs except those made strong by the mountain air, could have stood that test. She laid him on his own bed, on the lower floor, and set his broken ribs the best she could. She covered him up with thick, fleecy blankets, and set a bottle of whisky beside the bed. Then she wrote a note to Dan and fastened it upon one of the interior

doors.

She had learned, long ago, the value of frequent rests. She did not fly at once to her long tramp. For three minutes she lay perfectly limp on the fireplace divan, resting from the exertion of carrying her father down the hill. Then she drew on her hob-nailed boots—needed sorely for the steep climb—and pocketed her pistol. She thrust a handful of

jerked venison into the pocket of her coat and lighted the lantern. The forest night had fallen, soft and vibrant and tremulous, over the heads of the dark trees, when she started out.

Far away on a distant hillside, Whisperfoot the cougar howled and complained because he could find no deer.

(Continued Next Week).

A Story for Children

The Snowman

Billy and Kenneth Make a Snow Man

BILLY and Kenneth looked at their snowman with triumphant eyes. They had worked hard making him and could well be proud. Now they were trying to name him and it was Billy who first had an idea.

"He looks just like our janitor, Banco, with that broom under his arm and a pipe in his mouth. Let's call him that."

Banco became his name and for a while the newly made man had a fine time. The children played with him, pretending that he was their visitor from a cold, cold country. But soon Aunt Sally called them and as they smelled the spicy odor of ginger cookies, they quickly scampered off, leaving their snowman alone.

His smile turned into a scowl as he remarked:

"Isn't that just the way with those selfish children? I should think they would be more polite than to leave me here to entertain myself. What shall I do? I wonder when they will be back? My, this sun is hot!"

Just then the sun went under a cloud, and soon Banco began to shiver, for something cold seemed to be flying about him and touching him here and there. Some one slapped him in the face and then laughed merrily.

"Who is that?" Banco tried to turn his head but it was on so tight that he couldn't move it.

"It is I, North Wind. I've come to play with you." And again, he hit Banco so hard with his icy fingers that Banco almost tumbled over. "Well! I don't like you," snapped the snowman. "You're too rough and besides you've chased the sun away and I'm chilled thru. You're making me colder every minute. I wish you would call the children and then go away."

"Ho! ho!" laughed North Wind. "You're never satisfied. The children won't come out as long as I'm here for they are afraid of me, and I'm not ready to go yet. He blew water.—L. M. K.

"Oh, p-please g-go away North Wind!" chattered poor, frozen Banco, "and let the sun come back. Give me a chance to get warm."

"All right," consented North Wind

at last. But you'll be sorry you were

so rude to me and soon want me

back."

Once more the sun came out and

once more the snowman smiled. The

sun came closer and closer. Banco's

coat thawed out and little streams of

water ran down his sides.

"Mr. Sun, don't come so close.

You're scorching me," Banco called

weakly.

He got weaker and weaker and

smaller and smaller. A faint laugh

could be heard behind him.

"Is that you, North Wind? Please

come back now," begged Banco. "I'm

warm and will play with you now."

"Oh, no you won't!" sneered North

Wind. "You didn't want me, when

I was there and you needn't think

I'd come back now. I tried to help

you and you only thought I was

treating you badly. Oh, no, play with

the sun." And that was the last to

be heard from the wind.

Great tears rolled down Banco's

cheeks and no pleading of his could

make the sun go in. Soon he heard

Billy and Kenneth shouting and once

again he had hope. "Maybe they will

save me," he thought. But when

they saw him they laughed and

shouted.

"Look at Banco shrinking! Banco's

shriveling up like a little old man!"

Banco had just enough strength

left to murmur: "I don't want to stay

in such a cruel world anyway," and

then he knew nothing; for all that

remained of him was a little pool of

water.—L. M. K.

Avery-ize Now For Bigger Profits

The problem now is to raise bigger crops at lower cost. Increased production and decreased expense is now more important to you than ever before. Getting a tractor is the logical, practical answer to your problem.

Only a tractor can give you the economical power needed to work your land in the right way at the right time to get the best seed-bed—speedy power to take advantage of weather conditions, and hurry up your plowing, discing, harrowing and planting—fireless power that can do in hours' work that now takes days—hardened power that's ready in the early Spring when power is needed most—concentrated power that enables one man to do the work of several with horses—these mean lower costs, bigger crops and greater enjoyment in farm life.

seven sizes in the regular design using "Draft-Horse" Motors and "Direct-Drive" Transmissions—also two small Avery Tractors, the Model "B" 5-10 H. P. and the Model "C" Six-Cylinder. One and two-row Motor Cultivators, Motor Trucks, Power-Operated Tillage Tools, and Champion Grain-Saver Threshers and Silo Fillers.

Send For the Avery Catalog

Avery quality is now better than ever—there are many pleasing surprises for buyers of 1921 Avery machines, all shown in the new Avery Catalog. Write for a copy today. It is the most complete, up-to-date book ever published on motor farming machinery. Every farmer should have a copy. Sent free upon request.

You Can Afford a Farm in Fertile Ontario or Quebec

The wave of high land prices may well turn your attention to the opportunities to be found in these two older Provinces of Canada. Here, close to immense cities—great industrial centers—with all the conveniences to be found in any land anywhere, are farms which may be bought at very reasonable prices. Owners are retiring, independent—in many cases rich. High prices for all farm products, good markets, all the conveniences of old, well-settled districts beckon you to investigate.

A Wonderland of Opportunity for the Pioneer.

If your means will not permit you to buy an established farm, Ontario and Quebec offer great fertile regions where the pioneer can hew out a home for himself and family—where prosperity and independence are to be won by those who will put forth the effort. Every branch of agriculture may be followed in these Provinces; dairying and stock raising are particularly successful.

FARM PRODUCTS SHOW

(Continued from Page 5).

was found that a boy, Walter Miller, of Erie County, won with his white skins as he had in his own class.

Egg Show Was a Big Success

The third annual state egg show was held under the auspices of the Pennsylvania State Poultry Association in connection with the farm products show. The object of this was to encourage the production of more and better poultry and eggs and to show the producer the grades of eggs and their relative value. That it was a success is told by the fact that there were 220 dozen eggs entered by poultry keepers.

For the best dozen brown eggs in the show the five dollars went to Mrs. W. F. Hill, Huntington, and for the best dozen white eggs in the show, A. W. Brubaker, Lancaster, received five dollars for those from his single comb White Minorcas.

For the best exhibit containing five dozen brown eggs, J. C. Funk, White Haven, won first; Mrs. G. D. Marles, Neurville, second, and Chanticleer Poultry Farm, Ulster, third.

For the best dozen white eggs in the farmers' class A. W. Brubaker was first and Mrs. D. W. Line, Carlisle, was third. For the best dozen brown eggs Mrs. W. F. Hill was first; Lizzie Krubel, Celars, was second, and Mrs. T. A. Yost, Eiters, was third.

In the commercial class for the best dozen white eggs James M. Schropp, Hegins, won; Chanticleer Poultry Farm was second and Paul R. Guldin was third. For the best dozen brown eggs John R. Guldin, Yellow House, won; Chanticleer Poultry Farm was second, and G. E. Albright and Son, Mechanicsburg, was third.

In the boys and girls class for white eggs Pauline Trimmer, Mechanicsburg, won; Omar Ash, Benton, was second and Ned Schroppe, Hegins, was third. For best dozen brown eggs Ralph Woodburn, Claysville, won; Hawkins Scott, Fredricks-town, was second, and Ruth Trimmer was third.

A Machine For Every Need

In these days when there is a machine to do almost everything on the farm we expect to see all of them at a show of this character and the visitor to Harrisburg was not disappointed. Of tractors alone there were sixteen different makes and several styles of some makes. Then closely followed motor trucks, full lines of farm machinery, spraying outfits, milking machines, separators, barn equipment and so on down the list to bee and poultry keeping necessities. Most of the machinery was on the second floor of a large garage at Fourteenth and Howard Streets and with plenty of light it gave a faint idea of what proper housing would do for a display of this kind. Several of the dealers present said that business was not as good as it had been because farmers are feeling the marked fall in the selling price of their products but they are expecting things to be better as we get nearer the planting season. One noticeable readjustment on the part of manufacturers to meet the conditions facing farmers was the recent price reduction of one of the popular makes of tractors. A goodly number of possible purchasers seemed to admire it, too, over some of the others whose makers seem to think that the war is not over yet.

Work of Rural Vocational Schools

The rural county vocational schools under the direction of the State Department of Public Instruction, had an extensive exhibit of shop work, charts and photographs showing what is being done in the 52 counties where these schools are now established. This state has more boys than any other in the Union in the vocational schools, altho the start was only made in 1913 with five schools which soon dropped to three.

It would be hard to think of some useful thing for the farm which was not on exhibition as having been made by boys in the shop work. Wagon jacks, trap nests, double trees, milking stools, hog feeders, many useful bits of iron work and hundreds of other things testified to the practicability of the work in these schools. What the girls have done was shown by tables full of dresses, basket weaving, painted household novelties and sewing of all kinds.

Showing What the College Does

Pennsylvania State College made a very creditable showing in their large educational exhibit featuring a number of lines of work vital at this time to farmers. The value of spraying apples and potatoes was vividly shown by piles of fruit from sprayed and unsprayed trees and plants. From the figures over the piles a little mental arithmetic would show the loss or gain on an acre crop. The simplicity of mixing spray formulas was shown and full directions given as to when and how they should be applied.

The school of forestry from the college had several specimens showing the value of crosscutting soft woods and Prof. Anderson was kept busy most of the time answering questions about trees since wood has reached its high values. By means of photographs and charts it was shown how some trees are being sacrificed into \$25 worth of cord wood when they could just as easily be converted into \$80 worth of saw lumber or other products in between the two.

Women Were Well Represented

Women's interests were not forgotten when space was allotted and the section set aside for the Home Economics Extension Work of the State College attracted much attention. The department, under the direction of Miss Pearl MacDonald, illustrated, for one thing, many ways of taking short cuts in the home sewing. Numerous samples were on hand and many women and girls under the direction of instructors, who were there all week, carefully studied them and undoubtedly will be able to apply them to their advantage.

In order to give an idea of the character of work being done by the girls sewing clubs thruout the state, more than 200 finished pieces from dresses to wash cloths, were on display from the different counties.

The exhibit showing the value of milk in the diet was possibly the one which struck the most popular cord as both city and country people—consumers and producers—found many applicable facts in it.

The college women had also arranged a striking nutrition demonstration featuring the value of sleep, cleanliness and simple diet for growing children. Modern methods have made a game out of the task of building up undeveloped bodies and many parents stopped and wondered at the remarkable gains shown by the recorded cases.

Economy is often not so much "going without" as spending judiciously.

Renew your old silo and get a 3-Wall Craine at half the cost of a new silo

The Craine is the most economical as well as the strongest and handsomest silo you can buy—a 3-wall structure that gives triple strength and protection; that keeps silage succulent, unspoiled, protected from frost and harmonizes with the finest buildings. Inside is the wall of upright staves, closely fitted; then a wall of Silafelt to keep out water, air and frost; then the spiral Craineinox covering of enormous strength, which reinforces every square inch against pressure from within and without. No hoops, no lugs, no tinkering, no repairs.

By using the materials from your old stave silo you can have a Craine Triple-wall Silo at about half the cost of a new silo. Write us for full particulars; also for agency proposition.

FEEDING ROOTS

Roots, such as mangels, carrots or turnips are valuable winter feeds for dairy cows, feeder steers, young heifers, horses and sheep. They are especially valuable on the small farm where silage is not available. This fact has long been recognized by the farmers of Europe and some of our people have become converts to the fact.

An old man, who has long fed roots to his cattle, has given us his methods of feeding. He stores the roots in a cellar where the temperature stands at a point just above freezing all winter. He says it is unsafe to bring the roots directly from the cellar and give them to the animals, as they cause sickness when fed cold; so he brings the daily ration from the cellar to a heated room, where they are allowed to remain until the next day. Then the roots are cut fine and fed to the stock. This warms them to a degree which makes them safe to feed. He also says feed in the morning, especially in very cold weather. Roots are largely composed of water, so it is better for the animals to put them into the stomach in the morning. Roots are not calculated to furnish a large amount of body heat.

This man says feed roots to dairy cows just after the morning milking. Fed at that time, there is no danger of imparting a disagreeable taste or odor to the milk, even when turnips are fed. Other stock should be fed any time in the afternoon. He cuts the roots fine, believing it better to put in a little extra time than to take a chance of choking the creatures.

Carrots are fed to the horses. When the animals have little work to do, this cuts down materially on the grain bill. Mangels are best for milking cows while turnips are fed to other stock. The last named are very cheaply grown but are not of so much value as carrots and mangels.—C. H. Chesley.

over two hundred pure bred breeders, Holstein and Jerseys predominating.—D. K. S.

CONCERNING MILK PRODUCTS

Officials claim that the heavy and unlooked for decline in butter prices during the month of January has been largely due to the heavy and constant importations of foreign butter. During one week alone the importations amounted to the equivalent of 35,761 tubs of 62 pounds each. The domestic receipts during the same time were 34,796 packages.

A New York man well versed in the butter business, states that he fully expects that 20,000 to 25,000 cases and boxes will arrive here in February from Denmark, Holland, and Argentine. Denmark is making a reduction in her offerings for early shipments, thus making it cheaper than any of the stock that has arrived here.

In the face of the further decline in city milk prices on February 1st, it is doubtful if the leading brands of condensed milk can be maintained on a \$10.50 basis as it has been of late.

In evaporated milk, the only open market wholesale trading has been with European relief.

It is predicted by many that inside of twenty years, condensed milk will be a thing of the past and no longer of commercial importance as milk powder is much more economical to produce and the general public is beginning to appreciate its merit.

Several condensers in Pennsylvania and New York are already talking of changing over to milk powder.

The farmers at Lebanon, N. Y., have purchased the Borden plant at that place and Sunday, Jan. 30, commenced making cheese. The plant cost \$5000. Morrell Upham has been engaged as manager.—E. M. L. B. Susquehanna Co.

PREVENT SILAGE FREEZING

One of the most satisfactory things about feeding silage is that one does not have to dig out his cow and steer feed from a snow bank every time he needs feed during the winter. Still there are some things about feeding it that can be more convenient than they usually are.

Freezing of the silage in the silo is one of the annoyances. This can hardly be prevented by any silo that I have ever seen unless some additional precautions are used besides the silo wall itself.

I find that by keeping the edge dug down well—say 8 or 10 inches—and the center in a mound shape the freezing will be much less. Silage is warm even in winter but it cannot counteract the cold from the outside clear up to the silo wall. This allows less edge or surface to come in contact with the wall and helps to prevent freezing a good bit.

I have used a heavy blanket made of cottonseed meal sacks sewed together. This gives quite a protection all right and if one will use both the mound shaped top and the blanket the freezing can almost entirely be prevented with a wood silo.

After the silage is thrown down it can be protected by piling in one mound and throwing a blanket over it.—Earl Rogers.

Time was when the farmer's big job was to produce food. Now in pure self-defense he has to struggle with the marketing question, too.

PURE BRED CATTLE DEMONSTRATE VALUE

In the six cow test associations in active operation in Bradford County, Pa., there were 218 cows that produced 40 pounds or more of butterfat the past association month.

The high cow is a pure bred Holstein owned by C. W. Newman of the Wyalusing Association. She produced 90.4 pounds of butterfat and 2260 pounds milk. The second high cow is a pure bred Holstein owned by Fred Bohlayer of the Canton Association. She produced 90 pounds of butterfat and 2501 pounds milk. The third and fourth high cows are also pure bred Holsteins owned by H. C. Gates of the Canton Association. These cows produced respectively 80.5 pounds of butterfat and 2117 pounds of milk and 79.5 pounds of butterfat from 2208 lbs. of milk.

Of the above mentioned 218 cows, fifteen cows produced more than 60 pounds of butterfat, twelve of the fifteen were pure bred Holsteins, one was a pure bred Jersey and two were high grade Holsteins. Forty-four cows produced between 50-60 pounds of butterfat, twenty-two being registered animals and twenty-two being grades.

With this line of fact demonstrating the value of registered cattle, it is reasonable to believe that there will be a consistent gain in the number of farms in Bradford County that will in the future own pure bred cattle. At the present time we have

5 CENTS a day invested in a DE LAVAL may save you from 25 cents to \$1.00 a day

A DE LAVAL Cream Separator is the best paying investment any cow owner can possibly make.

It saves twice a day, 730 times a year, over any other system or inferior separator—in quantity and quality of product, time and labor.

Its cost represents an investment of about 5 cents a day for ten years, including cost of operation and interest on the investment. With simple care it will give good service not only for 10 but for 20 to 30 years; it practically never wears out.

Such an investment may save you from 25 cents to \$1.00 or more a day, according to the number of cows, returning from 500% to 2000% profit on the investment. Every day you delay the purchase of a De Laval you waste and lose money.

Today a De Laval Cream Separator, considering its improvements and quality of construction, is one of the cheapest things you can buy. With cheaper feeds and butter-fat at present prices there is more profit today in butter-fat than there was a year ago. Relatively, a De Laval is cheaper than it was a year ago.

See your nearest De Laval agent now about getting a new De Laval. Even though you have only one good cow, it will pay you to own one.

ORCHARDING IN PENNSYLVANIA

(Continued from Page 11).

men in this business—it calls for
philosophers with a stability of pur-
pose.

"I hope this crisis in the apple
industry will teach our wholesale
growers a lesson in the danger of
over-specialization. Western New
York has learned to combine apples
with other fruits and farm crops in
such a way as to most fully utilize
man and team labor thruout the year.
They have been able to withstand
several periods of depression in the
past 50 years, and they do not have
a red ink entry on their ledgers even
this year. Southern Pennsylvania is
destined to rival New York for pre-
supremacy in wholesale apple growing
within fifteen years and must take
this lesson to heart. Single crop
farming is disastrous in the long
run.

"The difficulties of the present situ-
ation are given us to overcome, not
to overcome us. In spite of them the
outlook is bright, but only for the
right kind of men. Speculators will
be caught, highly inflated stock com-
pany orchards will be deflated, but
the real grower whose heart is in
his work can look to the future with
confidence. He will receive a fair re-
turn for his labor."

RECLAIMING ORCHARDS IN CAR-
BON COUNTY

Carbon County enjoys the advan-
tages of nearby markets probably a
great deal more than any other coun-
ty in the state. In the south she
has her industrial towns; in the cen-
ter and northern section she has her
mining towns. These towns, al-
though not very large are quite nu-
merous and furnish very good mar-
keting places for the farm products
of the county. Many of the farm
products can be sold direct to the
consumer by the farmer himself and
thus he is able to get slightly bet-
ter returns than what he would be
able to get if he sold to a retailer.

The condition of the fruit trees in
this county is just the opposite of
what should be expected after taking
the marketing conditions into consid-
eration. The home orchards number
anywhere from 25 to 300 trees, and
most of them are on the decline.

These trees were planted anywhere
from 25 to 60 or 75 years ago and
since that time have received no at-
tention. Many of these orchards have
been kept in soil continuously and
instead of receiving fertilizer of any
kind have been robbed of their fer-
tility by having one or two crops of
hay taken off each season. As a re-
sult the trees have made very little
growth, if any, for the last few
years. The fruit which they bore
was usually undersized and of poor
quality.

From the standpoint of the mar-
ket conditions within the county and
from the possibilities that are hidden
in an old neglected orchard the Coun-
ty Agent encouraged a number of
farmers to take up some fruit im-
provement work.

Pruning demonstrations were con-
ducted in a number of old orchards
last spring and the farmers were
shown how to bring an old unru-
ly tree "back to earth" by cutting back
a certain amount of the tops. These
meetings were very well attended.
The farmers not only looked on but
actually did some of the pruning
work. They believed in the old max-
im "You learn to do by doing."

This, however, was only the be-
ginning of the fruit improvement

program. The real test came when
the men were obliged to invest in
high-priced spray machinery in or-
der that they might have clean fruit.
Twelve farmers invested in combina-
tion potato and fruit sprayers and
a number more invested in straight
fruit sprayers. These men formed the
nucleus around which the fruit im-
provement work of the county was
to grow.

Spraying information was drawn
up and given to each farmer who was
going to spray his trees. The infor-
mation dealt with (1) materials to
use; (2) time of application; (3)
insects and diseases to be combated.
The extension pathologist or the ex-
tension entomologist accompanied the
County Agent at various times so
that they might know the various in-
sects and diseases that were present
and thus help in the prevention or
the elimination of the same. The
farmers were especially urged to
keep the spraying pressure up to 250
or even 300 pounds, and also to
spray the trees very thoroughly so
that not a limb should be missed.

The results obtained by this care
are shown by the following figures:
In 1919 the unsprayed orchard of
Mr. Q. E. Hahn produced 125 bushels.
In 1920 the same orchard carefully
pruned and sprayed yielded 2250 bu.
of apples of which over ninety per
cent was first-class fruit. Similar re-
sults were reported from the orchard
of Mr. Q. O. Buck which produced 150
bushels of fruit in 1919 and 2000 bu.
in 1920 when sprayed and given the
proper care. Of Mr. Buck's 1920 crop
over eighty-seven per cent was per-
fect fruit.

Results similar to these were ob-
tained thruout the county and the
men who sprayed have been able to
sell their crops to good advantage,
while the sooty, scabby and warty
fruit from neighboring unsprayed or-
chards has been hard to sell at any
price. The good results obtained by
this one season of good orchard man-
agement make it certain that this is
but the beginning of orchard reju-
venation in general in Carbon Coun-
ty.—Nicholas M. Rahn, County
Agent.

WHAT TO DO FOR ONION
DISEASES

The onion is susceptible to the
onion smut fungus only while in the
young seedling stage. After the
plants reach a height of 3 to 4 inches
they become immune to further in-
fection. Smut spreads slowly in the
soil, but an infested area in a field
will gradually become larger and
more severely diseased each year on-
ions are grown on such an area. The
spores are spread on farm imple-
ments, the feet of men and animals,
by surface water, and in dust car-
ried by the air. Purchasers of on-
ions sets should use caution that they
do not contaminate the soil by plant-
ing smutted sets.

Control is accomplished in home
gardens by changing the location of
the onion bed to clean soil, or by
planting sets instead of seed. In
large commercial onion districts of
northern states formaldehyde solu-
tion is applied in the furrow with the
seed, as this disinfectant holds the
fungus in check. One fluid ounce of
37 to 40 per cent formaldehyde solu-
tion is used with each gallon of wa-
ter, this diluted solution being ap-
plied at the rate of 200 gallons per
acre or 1 gallon to about 185 feet of
row. Farmers Bulletin 1060, recent-
ly issued by the United States De-
partment of Agriculture, describes in
detail the apparatus used in apply-

ing this fungus-destructive seed pro-
tector. As a rule, it costs about \$5
an acre to insure the onion crop
against smut losses in this manner.
It is advised that the tops of diseased
onions be burned after harvest in or-
der to prevent the return of infected
onion refuse to the soil. The spread-
ing of waste from onion warehouses
is a bad practice.

A Destructive Plant Disease

Onion mildew or blight is some-
times serious in the cooler and more
humid onion districts. The disease
commonly starts in the field in spots
and spreads to the surrounding areas,
its development being greatly aided
by moist weather. It centralizes its
attack on the leaves which turn yel-
low, become covered with furry
growth, and eventually collapse. The
disease occurs wherever onions are
grown extensively, altho the control
varies in different sections. A fungus
causes the disease, the furry masses
on the affected leaves being branches
of the fungus, which bear abundant
spores. Warm weather promotes
spore germination and hence is fa-
vorable to the spread of the disease.

As the spores winter in the onion
field, an efficient crop rotation is one
commendable method of control, the
supplementary growing of cabbages,
potatoes, and sugar beets with onions
being valuable. Good soil drainage
also helps to reduce the blight, since
it decreases the moisture in the air
near the surface of the soil. Good
air drainage of the field is also es-
sential so that excessive dew and fog
may be avoided. Rosin fish-oil soap
as a sticker, makes the use of Bor-
deaux mixture effective in controlling
onion mildew. The Bordeaux mix-
ture consists of 4 pounds of copper
sulphate, 4 pounds of quicklime, 3
pounds of rosin fish-oil soap, mixed
with water to make a 50-gallon solu-
tion.

Root Knot

Root-knot of onion is an eelworm
disease which dwarfs the above-
ground parts of the plants and re-
duces the size of the bulbs. The eel-
worm, a minute nematode, lives in
the soil and causes galls on the onion
roots. Live steam applied under con-
siderable pressure will free the in-
fested soil of eelworms. In large
areas where steaming is not prac-
ticable, nematodes can be reduced by
a proper system of crop rotation, as
the avoidance of susceptible crops
starves out the eelworms. However,
to avoid root-knot it is never advis-
able to plant onions on land known
to be eelworm-infested.

Neck Rot

Neck rot, another onion complaint,
may be avoided by providing proper
irrigation and protecting the crop
from damp weather after harvest. Ar-
tificial curing by passing a current
of heated air over the onions in shal-
low crates until the necks are thor-
oughly dry also reduces losses.

Soft Rot

Soft rot is caused by a group of
bacteria which also damage cabbage,
carrots, celery and many other vege-
tables. Crop rotation and sanitation
should be employed to suppress it,
and precautionary measures in har-
vesting, curing and storing the crop
should be followed religiously. All
affected bulbs should be sorted out
before storage or shipment.

General sanitary measures and pro-
tection from moisture after harvest
are efficient in controlling onion
black mold. The bulbs should be
thoroughly dry before they are shipped.

Grow Strawberries

Nothing equals strawberries as a cash crop on the small place.
One customer reports \$1542 from less than 1/2 acre. Every
farm and town garden should have a patch of strawberries
for the home table.

Allen's Book of Berries for 1921—tells just how to
grow big, luscious strawberries for market and table. It de-
scribes Everbearing Strawberries which will yield until frosts
tip the green berries. Plant these this Spring and you can
enjoy home-grown berries by August 1st.

This Berry Book also describes and prices the leading early, medium and
late standard strawberry varieties. Write for it today.

FARQUHAR for
SAWMILL MACHINERY

OUR Standard Farquhar Portable Saw-
mill insures you fast, accurate service
and long life. Built in four sizes with ca-
pacity 300 to 15,000 feet. Also the Pony
Mill for light work.

The Farquhar Double Belt Feed equals
the flexibility of a variable friction feed in
cutting, besides has the speed for quick re-
turn of carriage. Simple, easy to operate,
with wear reduced to a minimum by slid-
ing the friction on to specially prepared
belts instead of on feed proper. We offer
the choice of either Standard or Log Beam
Carriage.

Farquhar Mills are
most economically op-
erated by Farquhar Power;
Cornish "Slab Burner"
and Locomotive Port-
ables, also styles K and
W Tractors.

Write to us concern-
ing your requirements,
and we'll send full de-
scriptions and make rec-
ommendations.

90% of tractor
engine trouble
is due to inferior oil

"If my tractor should stop
during this ploughing
season," a farmer said the
other day, "the delay would
cost me anywhere from three
hundred to fifteen hundred
dollars." Your own situation
may never be so acute—yet a
"layup" at ploughing season
is always expensive.

Are you playing safe? 90%
of tractor engine troubles are
due to inferior oil. Under
the terrific heat of the engine
—200° to 1000° F.—ordinary
oil forms great quantities of
sediment. Sediment has no
lubricating value. The founda-
tion for every sort of
trouble is laid.

You can avoid such

troubles with your tractor.
Sediment is reduced 86%
when you use Veedol, the lu-
bricant that resists heat.
With Veedol in the crank-
case, cylinder grinding,
bearing wear, carbon, valve
troubles are all held down to
a minimum.

Have your engine flushed out to
cleanse it of grit, sediment and
thickened oil. Put in Veedol. Lead-
ing dealers have it in stock.

**Veedol lubricants for every
part of the car**
Use Veedol lubricants for all parts of
the car: Veedol for the engine (Light-
Zero, Medium, Heavy, Special
Heavy, Extra Heavy); for the differ-
ential and transmission Veedol Trans-
Gear Oil or Gear Compound; for
the tractor and truck Worm Drive
Oil; Graphite Grease; Cup Grease

Lower Farm Implement Prices

The break has come. For sometime prices paid for farm products have been low. It is but natural to want lower prices on the farm implements used in producing crops.

Announcement is made by the Oliver Chilled Plow Works of a general price reduction in their lines that brings prices to the basis of 1918. They are among the first to make this reduction and are taking the loss that there has been little reduction in labor or ma-

terial—as their contribution in hastening a return to normal conditions.

This is your opportunity to secure new, up-to-date Oliver quality implements that will help you produce a full crop, and get them at a price in line with the reduced prices on your farm products.

COUNTY NOTES

Mifflin Co., Pa.—Had very fine winter weather since our last report; some cold mornings but mostly warm thru the day; not much snow till last night it sleeted about four inches with a little rain. A few sleds out. Farmers still hauling and sawing their year's wood supply. Farmers in the Kishocoquillis valley got some plowing done. Not many cattle fed, so farmers are keeping more cows and shipping the milk for which they received \$2.95 per 100 pounds in December. Dressed beef selling at 16¢ 17c lb.; dressed pork, 15c; lard, 18¢ 20c; butter, 65c; eggs, 60c; apples, 75c bu.; potatoes, \$1.50; grain same as last month. wheat, \$1.50; corn, \$1.25; oats, 60c. Not much market for cows and horses, except very good ones; general work feeding and tending stock. Quite a number of idle men on account of public works shutting down, and the railroads reducing their forces. The mild winter is favoring the poor people.—J. H. Byler.

Forest Co., Pa.—Crops in general were fairly good the past season. Apples were abundant about forty per cent of the crop was not harvested. Very nice fall weather prevailed, giving farmer a splendid opportunity to do up the fall work, threshing, corn husking and potato digging were all done in good time, but not quite the usual amount of fall plowing was done. The ground has been frozen all thru January, but not much snow. The roads have been in fair condition, though a little rough at times. Some farmers are feeling a little blue on account of prices of farm products being so low, no demand for fat cattle; dressed beef is about 14c; hides, 3c, and grain below a living price; butter, 65c; eggs, 60c, but we don't hear any one talking of quitting.

Some purebred cattle and hogs have been brought into our county, and on January 14th, a very interesting meeting was held in connection with the Farm Bureau at Tionesta, Pa. Ten men who are interested in the development of the purebred hog industry in Forest County were present. Dr. Hayner gave an idea of prices and agreed to furnish information and give assistance concerning places where good breeding stock could be obtained reasonably.—C. E. M.

Union Co., Pa.—The corn show at Harrisburg last week was well attended by farmers from this county, and several prizes were awarded for corn from the county. Some corn has been marketed lately shelled, at 70c bu., and several carloads of wheat to a local miller near the railroad were marketed at \$1.80, though \$2 would start wheat to market in a hurry. Sixty some farm sales are advertised for March in this county and a number will be held in February. Lower prices, high price of labor, farms changing owners and others retiring are the reasons for so many changes.—J. N. Glover.

Blair Co., Pa.—We are having real spring weather. We are afraid it will injure the fruit. We have had very little snow here so far. The shops around here are all laying off men. Farm labor is plentiful now when it is not needed so badly. The markets are as follows: Potatoes, \$1.50 bu.; apples, \$1.25 bu.; eggs, 75c doz.; grain remains about the same as last month. The ice harvest is almost a complete failure so far.—H. M. McVey.

Frederick Co., Md.—Old citizens say this has been the mildest winter on record. The ice crop has been unusually short and indications are that but few of the ice houses will be filled.

The wheat is small and has been injured by frost, there being no snow to protect it. The early part of January was exceptionally mild and many farmers were able to plow their corn ground.

Hogs for market are scarce as nearly all feeders sold early fearing a drop in price. The farmers of this section are almost without exception opposed to a return of the daylight saving law.

FEDERATION OF FARM BUREAUS IN NEW JERSEY

The Morris County Board of Agriculture is now the county unit of a great national farmers' organization. Farm men and women of the county know that the business of the County Board, in the past, has been the development of the agriculture of the county, thru the work of the County Agent, Home Demonstration Agent, and the Boys' and Girls' Club Agent. The program for 1921 shows that the county will continue to co-operate and to develop the work along these lines. This year, however, by joining the County Board of Agriculture, one automatically becomes a member of the State Council of County Boards and the American Farm Bureau Federation. Aside from the benefits which members will derive from their local county organization, then, and the state body, they are supporting a great national movement.

The New Jersey Council of County Boards of Agriculture was organized in January, 1920. It is the farmers' state organization for all statewide problems and it stands for the following things:

- 1—A more profitable farm business thru—
 - (a) Successful competition with the city for labor and capital.
 - (b) A fair price for farm products.
 - (c) Better distribution of farm products.
 - (d) More efficient marketing.
 - (e) Improved transportation service.
 - (f) Just transportation rates.
- 2—State and Federal laws for the advancement of agriculture.
 - (a) To deal justly in case of all measures and policies affecting the interests of the producer, as well as the consumer of farm products.
 - (b) That provide a better rural education.
- 3—A public better informed of agricultural facts.
 - (a) A better informed farmer, resulting from co-operation with all state agencies promoting agriculture.
 - (b) A better informed consumer, resulting from the publishing of facts concerning conditions needed for producing a safe food supply that will afford the farmer a comfortable living and guarantee the consumer his food at a reasonable price.

These things can be accomplished only by the full co-operation of every farmer in the county and state, who will decide the program of work which will accomplish these things and stand back of this program in a united body.

During the past year, the State Council has obtained much needed amendments to the game laws.

The Best Rule

For Every Farmer who believes it pays to sow the very Best Seed, is to—

"Sow Hoffman's Grass Seeds"

1 CLEAN Free from weeds — "The best of the crop"

2 PURE Very high tests — average about 99%+

3 SOUND Every bush tested for highest germination

4 HARDY Survive Northern Winters

TREAT EVERYBODY ALIKE—CHANGE GAME LAWS

A great deal of time and energy is expended at each session of the Legislature on laws to govern the taking of fish and game during the following two years. Few questions elicit as much interest at Harrisburg as does this.

This is a natural habitat for fish and game. With our large area of wooded mountain land (whereon are many fine fish streams), with our numerous state forest reservations—and others likely to be secured soon—we have ideal conditions for producing fish and game. And within legal limits fishing and hunting can, and should be, carried on in season without damage to private property. The time is here when the rights of property owners should be respected. Many hunters seem to feel that wearing a license certificate on the coat sleeve gives the right to tramp all over private property, to leave gates open, bars down, to break or cut down fences, to steal fruit, shoot poultry, etc., etc.

The posting of property has, in many sections, become a joke. The signs are ignored, the owner jeered at, even threatened, if he undertakes to remonstrate. When the Legislature passed the law requiring the property owner to post his land if he desired to exercise any control whatever over his property, it put the shoe on the wrong foot. Let it now put the shoe on the other foot and make it a misdemeanor for any one to go upon private, seated land with gun or fishing tackle unless carrying the written permission of the owner to do so. Put the burden of proof on the hunter or fisherman to establish his right to be there. Some gentlemanly hunters and fishermen get this permission now. The other kind should be made to get it—or to stay off private land. This latter kind can find public property on which to fish and hunt in the state reservations. Private parties should no longer be expected to provide for such as he. The law should be made to protect property for the man who owns it and pays the taxes upon it. And this protection should be for twelve months in every year and not for only nine or ten as at present.

When one goes from the country into town, one is expected to not violate any private property there. Should one run over lawns, pluck flowers, knock piling off of fences, etc., the arm of the law would soon get into action. I know of no "open season" there, no weeks or months when the pleasure or whim of the trespasser supersedes the vested rights of ownership. The real estate owner there is protected twelve months in every year—and properly so. If there ever was any justification for making the farmer the goat of every Tom, Dick or Harry, our state forest reservations have taken it away.

If the hunting and the fishing public is given to understand that hunting and fishing privileges are accorded freely on these numerous reservations during the open season, and that trespassing on private property without the owner's written permission is a misdemeanor, the sportsman should be satisfied, and I am sure farmers will be.—W. T. Hill, Past Master State Grange.

If an income is to be of most use a record must be kept of the way in which it is spent; with that knowledge one can tell whether it has been distributed wisely.

"I couldn't afford not to buy!"

Two farmers were talking over the outlook for this year. "I've just bought a new E-B plow," said one, "and I'm figuring on a new cultivator. Expect to place my order this week."

"What's the hurry?" asked the other. "Do you think this is a good time to buy?"

"Well, I thought at first I couldn't afford them, right now," said the first, "but when I began to think about profits this year I decided I couldn't afford NOT to buy. As I see it, there's only one way to be sure of a successful year—to plow and plant as many acres as I can take care of, and make every day count for bigger crops at less expense. That means better implements—tools I can depend on to save me time and do the work thoroughly. The old machines may have pulled me through last year, but they won't stand another season's use."

Can you afford to put off buying this year? It's worth thinking about seriously. Let your E-B dealer show you the time and labor-saving features in E-B tools. You'll see how they can help you farm more profitably.

Cut the Costs—Swell the Profits

The stock-grower who keeps his cost of production low enough is safe on any market. Selling on a high market he gets big profits—on a low market he gets some profits instead of facing a loss.

And whether you produce dairy products, beef, pork, mutton or wool you can surely reduce costs by regularly adding to the ration the tested, dependable stock tonic—

Pratts Animal Regulator

It helps build and preserve stock health—that means work animals in the harness every day, steady milk production from every cow, rapid growth of young stock. It aids digestion—that means a saving of food, all used, none wasted. It strengthens and tones up the whole system—that means strength, vigor and vitality without which any animal is of little value.

Cut costs, too, by checking contagious diseases which may kill some of your stock and seriously injure the rest. Use, regularly and freely,

Pratts Dip and Disinfectant

to kill disease germs and parasites. As a dip to exterminate lice and ticks and overcome skin troubles. As a disinfectant to maintain stables and pens in sanitary condition. Low in cost—safe—powerful—efficient.

Make this your motto—"Every animal on the job every day." Then make good by using Pratt's Stock Preparations. You must be pleased—

LIVE STOCK

CARE OF THE BREEDING EWES

By W. H. Tomhave

The condition of the lamb crop will depend in a large measure upon the kind of treatment given the breeding ewes during the next few weeks. If the ewes are kept under conditions where it is difficult for them to get enough nutritious feed to keep in good breeding condition, a strong, healthy lamb crop need not be looked for. It is quite natural for the farmer to carry his breeding ewes thru the winter as cheaply as possible on account of feed costs. Such practice is commendable, but it must not be carried to an extreme and the ewes made to go up to lambing time on a ration that does not meet the requirements of the animal body for wool and lamb production. The feed allowance during the latter part of the gestation period should be more liberal than during the first two months of the period.

The selection of the feeds to give to breeding ewes will depend in a measure upon the feeds at hand and

necessary to feed very much grain before lambing time. It will usually pay to start feeding a small allowance of grain about four to six weeks before lambing time and allow it in amounts ranging from one-quarter to one-half pound per day, depending upon the condition of the ewes. After the ewes have lambed, the amount of grain allowed may be further increased if it is deemed necessary to do so to stimulate and keep up the milk flow for the lambs. Any additional feed allowed during the period while the lambs are suckling the ewes will reflect in the condition and development of the lambs. The combination of feeds used should consist of a variety and be rich in protein. A very desirable combination is one made up of three parts corn, three parts wheat bran and one part oil meal. A small amount of oil meal and oats may be fed, or a combination of four parts oats, three parts bran, one part oil meal will make a desirable ration. The grain mixture may vary considerably, depending upon the kind of roughage that is allowed. The prin-

Kaltuma Little, Millbrook, Pa., Club Prize Winner of \$50 in 1919

the kind that can be purchased to best advantage on the market. If there is an abundance of good clover or alfalfa hay on the farm, such hay should form the major part of the roughage allowed. If corn silage is available, the ewes should be given a limited amount of this feed in addition to good hay. An unlimited silage ration as roughage is not recommended as such practice seems to result in the ewes producing weak lambs. A combination of corn silage, not to exceed three pounds per day for a large ewe, and as much additional hay as they will consume, will make a desirable roughage ration. Breeding ewes should not be fed timothy hay as it is a poor sheep feed and also causes trouble from constipation. Oat straw and corn stover may be used, but when fed they should be given in combination with a legume hay or corn silage and a greater grain allowance. If silage is fed to sheep care must be exercised that it is in good condition, made from fairly mature corn and that it is not decomposed or moldy, as such silage is likely to cause abortion trouble among the ewes.

The amount of grain to feed and the length of time before lambing to feed it will depend upon the condition of the ewes. If the ewes are in good, thrifty condition and are getting splendid roughage, it is not

LIVE STOCK REPORTS

Nearly ten million less head of live stock were on farms in the United States on January 1, 1921, than a year preceding, according to estimates based upon reports of agents and correspondents of the Bureau of Crop Estimates, United States Department of Agriculture. Horses decreased about 602,000 head, or 2.9

February 12, 1921.

per cent; mules decreased slightly, 42,000, or 0.8 per cent; milk cows decreased, 298,000, or 1.3 per cent; other cattle decreased 1,880,000, or 4.2 per cent; swine decreased 5,078,000 or 7.1 per cent, and sheep decreased 2,047,000, or 4.3 per cent.

The total numbers on farms and ranges January 1, are estimated as follows: Horses, 20,183,000; mules, 4,999,000; milk cows, 23,321,000; other cattle, 42,870,000; swine, 66,649,000 and sheep, 45,067,000.

The total value of live stock has declined \$2,271,576,000 or 26.7 per cent during the year; that is, from a total of \$8,507,145,000 on January 1, 1920, to \$6,235,569,000 on January 1, 1921. This decline is due partly to the reduction in numbers, but more to the lower value per head.

Horses, with a value of \$24.45 per head as compared with \$24.42 a year ago, are lower than they have been since 1906. The total value of horses is estimated at \$1,664,166,000, which is \$298,337,000, or 15.3 per cent less than a year ago.

Mules have declined in price relatively more than have horses, due, probably, to the depression in the cotton states, where mules are largely used. The January 1 price, \$115.72, is the lowest value since 1916, whereas the value a year ago, \$147.07 was the highest on record. The total value of mules is \$578,473,000, a reduction of \$162,927,000, or 22 per cent as compared with a year ago.

Milk cows have declined 24.8 per cent in value per head, from \$85.11 to \$68.97, and in total value have declined \$518,228,000, or 25.8 per cent, from \$2,010,128,000 to \$1,491,900,000. Other cattle have declined 27.3 per cent in value per head from \$43.22 to \$31.41; and in total value have declined \$587,520,000, or 30.4 per cent, from \$1,934,185,000 to \$1,346,665,000. All cattle have thus declined \$1,105,748,000, or 28 per cent, from \$3,944,313,000 to \$2,838,565,000.

Swine have declined in value per head \$1.7 per cent, from \$19.01 to \$17.99, and in total value have declined \$497,636,000 or 36.6 per cent, from \$1,363,269,000 to \$865,633,000.

Sheep have decline in value per head \$9.1 per cent, from \$10.52 to \$9.61, and in total value have declined \$206,928,000, or 41.8 per cent, from \$495,660,000 to \$288,732,000.

COMMITTEE OF 15 TO WORK OUT MARKETING POLICY

The American Farm Bureau Federation, on December 31, named a committee of 15 to work out a general policy of marketing live stock for the farmers of this country in an effort to help solve some of the problems that have made live stock such a hazardous undertaking in recent years. Men recognized as the best qualified to sit on such a committee were chosen and there is hope that something really constructive that can be applied to the problem will come from them. With Dean Skinner of Purdue, Senator Kendrick of Wyoming, and the biggest men in the various state beef organizations on the committee, the brains are there, anyway.

While most efforts at "stabilizing" the market and other ideas of smooth it out so that it will run evenly from day to day, week to week, month to month, and from one year's end to the next, have met with little success, that doesn't mean that there isn't room for genuine co-operative effort to make better live stock markets. We will watch the new committee with hope for a time, anyway.

Why turn your dairy into a fertilizer factory?

Your object in dairying is to produce milk at a profit and not fertilizer at a loss. Food elements contained in feeds are expensive and should be converted into milk.

A great many dollars worth of food elements contained in feeds fed to dairy cows are lost by way of the manure pit. Such waste is due to the feeding of unbalanced rations. Too much roughage is fed without regard to its correct nutritive value and often grain rations are not compounded to blend properly with the roughage to form a balance of all the elements required.

TI-O-GA FEED SERVICE

overcomes this waste by classifying the varieties of roughage according to their nutritive content and furnishes a brand of TI-O-GA Dairy Feed to combine properly with each group to form balanced rations and prevent waste.

Red Brand TI-O-GA Dairy Feed
to be fed with low protein succulent roughage: Silage, Pasture, Green Fodder, etc.

White Brand TI-O-GA Dairy Feed
to be fed with medium protein dry roughage: Timothy Hay, Mixed Hay, Corn Fodder, etc.

Blue Brand TI-O-GA Dairy Feed
to be fed with high protein dry roughage: Clover Hay, Alfalfa, etc.

In each case the cow gets the same amount of nutrition in the same nutritive ratio and you get more money from your roughage. If your dealer does not have the kind of TI-O-GA Dairy Feed to balance your roughage, advise us and we will arrange for some nearby dealer to supply you.

Our book on **TI-O-GA Feed Service** and explanation of how the three feeds give the same results, sent free on request.

Tioga Mill & Elevator Co.
Waverly, N. Y.

The same careful service is furnished through:

TI-O-GA Brood Sow and Pig Feed.
TI-O-GA Growing Shout Feed.
TI-O-GA Fattening Hog Feed.
TI-O-GA Chick Feed.
TI-O-GA Growing Mash.
TI-O-GA Growing Corns.
TI-O-GA Laying Food.
TI-O-GA Poultry Grains.
TI-O-GA Calf Feed.
TI-O-GA Horse Feed.
Colonel's Ration (Full Feed for Horses).

SMITHSON HERD, LARGE TYPE BERKSHIRES.
Twenty young sows, bred to farrow in March and April, by Smithson's Masterpiece, the Wonder Boar, and son of the American champion, Symboler Junior, \$5 each. Splendid individuals.
Crystal Spring Stock Farm, Seseville, Pa.

PINEHURST HAMPSHIRE
Looking orders for gilts bred to Young Boar, first prize Senior Boar Pig, National Show 1920. Stock all ages. **JOHN W. COX & SON**, New Wilmington, Pa.

BRED BETTER TO MAKE MORE MONEY. I have for sale a good 8 months Berkshire Boar, Double Loe few blood, that will help. **W. F. MCFARRAN**, FURNISS, PA.

REG. DUROGS Large size, heavy bone, best blood lines, prices reduced for fall. Satisfaction guaranteed. **JOHN W. COX & SON**, New Wilmington, Pa.

FOR SALE—O. L. C. SWINE of the big fancy type and very best blood lines. **C. E. CASSEL**, HERSHEY, PA.

Large Berkshire Swine Registered High Quality **WHITE HOME FARM**, Center Valley, Pa.

CHESTER WHITES—bred sows and gilts, service boars, Sept. pigs, either sex, or pigs not aking. Free. **W. B. SAGER**, Twin Brook Farm, Newville, Pa.

Hampshire Hogs—Fine bunch well marked pigs, April delivery; open gilts, bred gilts, young boars, Yearling Boars, \$30. **W. D. NELSON, JR.**, Porter, Del.

NELSON'S BERKSHIRES—3 mos. old pigs, \$10. ea. Sired by Red 7759, Value 3d, bred gilts, \$20. Service boars, \$30. **W. D. NELSON, JR.**, Porter, Del.

REG. BIG TYPE POLAND CHINAS—bred gilts, service boars and choice Fall pigs. Farmers' prices. **R. H. LYLE**, CADIZ, OHIO

Kinderhook Duroc-Jersey Ass'n.
Co-operation among 30 farmers.
Breeder not dealer. Established 7 years. This is going to be a stock year; price of brood sows is astonishingly low. Now is the time to buy. We are overstocked. Write for description of the sows that you can buy for \$20 and up. There are some 30 of them farrowing after March 1. Address: **JOY MCAUGH**, Mgr., KINDERHOOK, N. Y.

FOR SALE—POLAND CHINAS
Of advanced big type breeding service boars, sows bred, fall pigs, bred by Fashion Giant and Ohio King, out of 700 and 800 lb. sows. Address: **C. S. Eppley**, Zanesville, Ohio, for descriptive price list and folder.

HAMPSHIRE
They have gained over a pound a day for us. Stock all ages, and Duroc-Jersey Cattle. Free Circular, Locust Lawn Farm, Bird-in-Hand, Box 2, Lancaster Co., Pa.

BERKSHIRES—Longfellow and Masterhood breeding. Only the best sold for breeders. Satisfaction guaranteed. Lots of five pigs on hand. Prices reasonable. **MARIONDALE FARMS**, A. L. Hostetler, Prop., Manheim, Pa., No. 1.

SPECIAL Big Type Chester Whites
SALE OF
Pigs 10 weeks to 8 months. Pairs and trio, no king. Sired by 100-lb. boars. Boars a specialty. **JOHN C. BREAM**, Gayle B. Thomas, Boonboro, Md.

DUROC JERSEY GILTS bred to a military good cherry King boar, for March and April farrow. Vigorous, growthy gilts of the big type priced at \$15 each. **GEORGE T. GILLAM**, CANANDAIGUA, N. Y.

BERKSHIRES—Large, type and prolific. Priced to sell. Write your desire. **JOHN C. BREAM**, Gettysburg, Pa. R No. 4.

DUROC BOARS ready for service. Pigs, gilts that will make something fine. Fall pigs, either sex. **B. H. SAGER**, BASIL, OHIO

CHESTER WHITES—Service boars, bred sows and gilts. September pigs either sex. **PURSEY CLOUD**, Cloudland Farm, Kennett Square, Pa. R. D.

PATHFINDER Duroc-Jerseys—Some of America's best blood at farmers' prices. **SATYR FARM**, Palmyra, Pa., R. No. 1

Big Type Chester Whites
We raised and own Prime Big Boar, Grand Champion Chester White Boar of the East. One of the biggest and smoothest living hogs of his age. Gilts, bred sows, service boars, Fall pigs, \$30; winter yearlings, \$15; show stock, all big type. **Victor Farms, Bellvale, N. Y.**

CORONA WOOL FAT

The Famous Healing Ointment for Cuts, Wounds, Burns, Sores, Bruises, on Man and Beast

I want every reader of this paper to know from experience what a splendid, dependable preparation Corona Wool Fat is, for the household or barn use. I want to send every one of you a FREE Trial Package. I don't ask for a cent of money—now or later—not even for postage. I just want you to have this Trial Package on hand when something happens, so that you can test it and see for yourself what a remarkable healing and soothing salve it is for caked udders, sore teats, barb wire cuts, rope burns, wounds, sores of any kind, hoof troubles, boils, scratches, sore shoulders, etc., on live stock.

I want you to also see how quickly it heals cuts, sores, burns, chapped hands and wounds of any kind on human beings, for I know if you once try it, you will never be without Corona in the house and barn.

The Healing Ointment—For the Home and Barn

Hardly a day goes by in which you will not find some use for Corona. It is a household word in over a million homes. After you use this trial package you too will say, "That's great stuff." Corona Wool Fat is not a grease, but the fatty secretions extracted from the wool and skin of sheep. It's different from any salve or ointment you ever tried. It heals and soothes, but will not smart or blister the most sensitive wound. It has healed thousands of wounds without leaving a scar where other healing lotions have failed.

Fertilizer Problems for Vegetable Growers

Some Helpful Suggestions for Keeping Up Soil Fertility

By J. G. LIPMAN

THE vegetable grower more than any other type of farmer must maintain his soil in a very high state of fertility. To do this most effectively he should know something about the factors that influence chemical and bacteriological processes in the soil. To do this most effectively he must also know something about so-called soil humus and the part it plays in soil fertility. He must know something about the nature and the treatment of sour soils. He must know something about plant-food, the extent of its presence in the soil, the nature of plant-food constituents in commercial fertilizers, farm manures and green manures and the effect of fertilizer treatment on the fertility of the soil. Vegetable growers should remember that the organic matter of the soil, commonly spoken of as humus, has certain relations to moisture content and temperature of the soil. It is well known that the space not occupied by solid particles, and known as the empty space or pore space, may be occupied either by water or air. The best conditions for plant growth are created when about half of the empty space is occupied by water. If too much water is present bacterial activities are interfered with and available plant-food is not produced rapidly enough. If too much air is present in the soil the plants are not properly provided with moisture and there is a tendency for the soil humus to decompose too fast. This may result in a loss of soluble nitrates and of other soluble plant-food by leaching. By increasing the amount of organic matter in the soil the conditions as to the supply and circulation of moisture are improved. The bacteria and other invisible organisms are provided with a sufficient supply of food and, because of their greater activity, they cause the formation of larger quantities of soluble and available plant-food.

The vegetable grower is at a loss how to find a satisfactory substitute for stable manure, which in years past was both ample as to supply and moderate as to cost. With the replacement in our cities of the draft animals by motor-driven vehicles the supply of stable manure has fallen off. The price has also increased to a point where it is compelling the grower to reduce the amounts supplied per acre. It is necessary, therefore, to think of a satisfactory substitute for stable manure if such can be found. Among the materials that may be suggested as substitutes are composts, peat and green manures. It is still the practice in Europe to compost manure with all sorts of refuse material, including, weeds, low-grade straw or hay, leaves, pine needles, etc. This is done for the purpose of increasing the supply of organic matter and of digesting, as it were, the insoluble and lower grade materials and transforming them into a more readily available manure. Before the days of commercial fertilizers, it was the custom in the United States to compost manure with peat or other refuse materials. It is claimed by Dr. S. W. Johnson, in his Muck Book, published soon after the middle of the last century, that one load of good manure mixed with four loads of peat or muck would produce material that, load for load, is just as efficient as composted manure itself. There are large supplies of peat in New Jersey and on every farm there are quantities of waste vegetable materials that could easily be transformed into good fertilizer by composting with manure. Because of the high cost of labor, composting may become an expensive process. It has, however, its possibilities even with the high price of labor, and it would not be out of place for us to consider the practical side of composting in the hope that we might effectively revive a practice that at one time played so important a part on the farms of America.

As to green manures, the vegetable grower is not always in a position to utilize them, since his soil is occupied by one crop or another from early spring until late in the fall. Something

may be said about growing clover, vetches, alfalfa, etc., on cheaper lands and hauling the green crop and spreading it as you would manure. This is sometimes done in the Oriental countries where labor is cheap. The same purpose may be accomplished at a smaller cost by arranging the rotations so as to allow the land to remain in alfalfa or a mixture of alfalfa and some other legume or another grass mixture that would allow the accumulation of organic matter. A good soil of this sort would then furnish ample humus for fairly intensive vegetable production.

Most of the soils in the humid regions of the United States are acid. On the other hand, most of the soils of the arid or semi-arid sections of the United States are the opposite of acid. Soils used for the growing of tilled crops in the humid regions of the United States tend to become more acid as the years go by. Hence, the need for liming arises. Smaller quantities of acid in the soil are not in themselves objectionable, but, as the acidity increases, profitable crop production is interfered with. Hence, the vegetable grower, who is using large quantities of commercial fertilizer and thereby increasing the loss of lime from his land, should consider the more or less systematic use of lime. However, it is well to remember that where stable manure is used more or less regularly the accumulation of acidity in the soil is retarded and, for this reason, the vegetable grower is not as greatly in need of lime as may be the general farmer who supplies less manure per acre and uses at the same time considerable quantities of acid phosphate, sulfate of ammonia and of potash salts. The vegetable grower may best provide against the accumulation of excessive quantities of acid in his soil by applying at frequent intervals small quantities either of ground limestone or of burned and slaked lime. By so doing he will assure conditions in his soil that will permit the best development of the plant roots and the formation of available plant-food by the germs living in the soil. This method will also prevent the accumulation in the soil of substances poisonous both to soil bacteria and to the crops. Very often vegetable growers may have the opportunity to buy at a low cost waste products containing lime, as, for instance, lime from acetylene plants, wood ashes, lime marl, etc. These can all be used to advantage for maintaining the land in a suitable condition.

Part of Displays at New Jersey Products Show

Among the plant-food problems that call for consideration on the part of the vegetable grower mention may be made of commercial fertilizers. There is a strong tendency in the fertilizer industry to develop more concentrated and more readily soluble fertilizers. New products, like double superphosphate containing 45 to 48 per cent of available phosphoric acid, ammo phos containing 13 per cent ammonia and 48 per cent phosphoric acid, nitrate of ammonia containing 33 to 44 per

cent of nitrogen, and others, are being developed and tried out under different soil and climatic conditions. These more concentrated fertilizers are cheaper to transport and to handle. On the other hand, because of their ready solubility and concentration, they are apt to burn the crop when used in larger amounts or where they are improperly distributed in the soil. The vegetable grower should also consider the question of suitable proportions among the ingredients in commercial fertilizers. Recent investigations show that it is important to use not only sufficient amounts of plant-food, but the different ingredients, such as phosphoric acid, potash and nitrogen, should be applied in suitable proportions to one another. It has been found that fertilizer mixtures containing four per cent of nitrogen, eight per cent of phosphoric acid and four per cent of potash contain the three plant-foods in about the right proportions. Roughly, one part each of nitrogen and potash and two parts of phosphoric acid seem to best meet the conditions as they exist in most soils. Other formulas like 5-8-5, 6-8-3, 5-10-5, etc. also seem to give fairly satisfactory returns. However, much will depend on the crop itself and on the nature of the soil as well as on the use of other materials. However, it is well known that the vegetable grower, who is aiming to produce large yields and to get his crop ready for the early market, must use not only generous amounts of plant-food but also fertilizer containing a high proportion of nitrogen.

It is important to remember that where large applications of commercial fertilizer are made they should be thoroughly distributed in the soil. It would also be well to remember that the nitrogen of nitrates and salts of ammonia (the most expensive constituents in mixed fertilizers) is sooner or later apt to leach out of the soil, and, for this reason, should be used so as not to allow undue waste. Where nitrate of soda is used in amounts up to 300 pounds per acre, or even more, two applications are often found more profitable than one. On account of the well known tendency of large quantities of soluble nitrogen fertilizers to force vegetable growth and to suppress the production of seed, seed, root and tuber crops should not be given excessive quantities of soluble nitrogenous fertilizers.

Finally, something should be said about the relation of certain materials, like sulfur, formaldehyde and carbon bisulfide, for controlling soil insects and certain diseases of crops. By the use of these materials injurious insects may be controlled or eliminated and certain of the diseases of plants may be made much less harmful.

HARFORD COUNTY CORN WINS

Harford County, Maryland, thru the efforts of G. P. Radebaugh and Sons, was again successful in defeating all competitors at the Pennsylvania Products Show. For several years we have tried to get an entrance into the Pennsylvania Products Show. This year we were permitted to come in under what was known as the World Class. By that is meant that the champion ears from other states having won in their respective states, would be thrown into that class along with others and then the champion exhibits from different sections of Pennsylvania would also be entered in that class.

After the judging of all the Pennsylvania corn had been finished and the champion exhibits in their respective classes were brought into the world class, we found that there were exhibits from five states. The exhibits from Harford County were so close that it took considerable time to determine the winner. The exhibit of Reid's Yellow Dent by Mr. G. P. Radebaugh & Sons was finally given first place, the second exhibit being that of Mr. Garnett Radebaugh.—B. B. Herrick, County Agent.

Orchard Machinery for Eastern Conditions

A Discussion of Implements Found Effective and Economical

By Prof. H. B. SEAVER
N. J. Experiment Station

THERE have been such rapid strides in the development of agricultural and horticultural machinery in the last decade that it keeps the average orchardist jumping to keep up with them. There have, likewise, been many machines put on the market which the orchardist has been inveigled into buying by the clever talking salesman only to be compelled, after a season's trial, to relegate them to the scrap-heap. There are more monuments to the gullibility of the average American farmer, with his motto "I'll try anything once," in the orchard machinery scrap-heaps, scattered behind barns around the country, than there are tombstones in the graveyards. There are almost as many different makes of machines as there are tombstones.

There are two categories in which we may place orchardists. First, the orchardist who raises his fruit as a side line. Second, the bona-fide commercial grower who specializes in fruit, and has an orchard of twenty-five acres or more.

For the first-class of orchardists, it is advisable to utilize general crop machinery for orchard operations, and purchase in addition some sort of spray outfit. A small, or one of the so-called "pony" or "Junior" rigs is advised if he has an orchard of from five to fifteen acres. This equipment should be sufficient to do his spraying.

In the second category we find a different proposition. The commercial, specializing, fruit grower must spare money with which to buy the improved types of machines, which he knows will save labor, or do a better job in his orchards, or packing house; or in other words any machine which will prove a profitable investment for him.

Orchard machinery may be divided into 4 groups. First, tillage machinery; second, spraying and dusting machinery; third, sizing and grading machinery; fourth, traction and miscellaneous machinery.

The common practice of most orchardists, who carry out the clean culture and cover crop method, is to break the land as early in the spring as possible with either the plow or the disc harrow. One year he throws a furrow to the trees, and the next year he throws it away from the row. This keeps the surface level. Such a practice, of course, requires close work. The writer knows of no better tool for this work than the one-horse, set-over beam walking plow. A narrow whiffletree, padded on the end with an old burlap sack, so as not to bark the trees, a steady, straight-walking horse, and an even tempered driver make up the other requisites to do a thorough job. After three furrows are plowed to the trees, the balance of land between the rows may be finished with the two-horse walking plow, or the tractor and tractor plows. When we come to plowing away from the trees, we simply plow as close as possible with the larger plows, and then setting the beam of the one-horse plow away from the

trees get as near as practicable without damaging them. The plowing away practice requires a more even tempered man, and a steadier horse than the plowing to the trees. The two-horse walking plow should have a wooden beam, and be of as light draft as possible.

It is not good orchard practice to plow over five inches deep, and the average farm team should be able to pull a fourteen inch bottom walking plow without extra effort. The type of moldboard should be low, with a sharp flare, so that trash may be covered deeply, and not interfere with the spring-tooth type of harrow, which will follow later.

Concerning tractor plows, the writer likewise advises the use of a low mold board with considerable flare. By using two tractor plows with much flare the writer was able to dispense with the one-horse plow in plowing to one and two-year-old trees, and throw the furrow directly against the trees.

It is a question whether it is profitable to use more than a two-gang tractor plow in the orchard under our modern system of close planting.

The next machine on the list, the disc harrow, is undoubtedly the most valuable tillage machine

With the tractor-disc combination we have weight and width combined, and the soil can be pulverized to a depth of four inches, and the cover crop thoroughly incorporated in one-third of the time that it would take to plow it.

Mulching Tools

Mulching tools are the next to be considered. Probably nothing counts so much in sizing up our fruit, under eastern conditions, as the ability of the orchardist to keep a good dust mulch, and his soil free from weeds, until July 1 to 15th, when our orchards should be sowed to a cover crop, so that the trees may go into winter in a mature condition.

The spring tooth harrow is a good tool for mulching purposes, but is of heavy draft, and picks up too much trash. However, it is much in use, and if the trash has been thoroughly turned under it proves a very fair tool.

There is another implement, recently introduced on the market, which is far superior to the spring tooth. This is the "Light Draft Extension Orchard Harrow." This harrow has the following features about it, which probably make it the best orchard mulch harrow in use today. First, it is of very light draft so that a team of heavy horses will pull it readily, if not set deep and with every other tooth removed; second, it extends out sufficiently so that it works up close to the trunks of our low headed trees; third, it is so arranged that it may be tripped at the option of the driver and rid of any trash that may have collected on the teeth; fourth, it may be set at any depth so that if the soil has become hard after a heavy rain, it may be again broken up to a sufficient depth, and lastly it has, with its 12 foot sweep a space devouring capacity which is not equalled by any other machine.

A 11½-foot harrow and a 10-20 tractor will cover 35 to 40 acres a day. The large spike tooth harrow is sometimes used, but it is entirely unnecessary if the owner possesses a light draft type of harrow.

In the second group of orchard machinery, comprising sprayers and dusters, we have many makes. However, they all may be classed under four divisions; the hand pumps, the power sprayer, the compressed air sprayers and, of course, the power dusters.

The duster has probably come to stay for the peach grower. In comparative tests, by the various experiment stations, with spraying in the last two years, it has shown that it controls peach scab, brown rot and curculio just about as well as spraying, with this in its favor: That the time required for the actual operation of making the application is about four to six times faster than spraying. To date it has not proven satisfactory as a substitute for spraying the apple, except that

(Continued on Page 21).

Efficient Orchard Machinery Makes for Economy of Labor and Time

Dusting is Gaining Favor With Many Orchardists Others Prefer the Liquid Spray Method as More Economical of Material

TOP-DRESSING TALK No. 4

Top-Dressing Wheat Pays

At the beginning of the growing season the young wheat plant weakened by the severe winter weather, needs plenty of quickly available nitrogen to restore it to a healthy, vigorous condition.

The average soil does not supply enough usable nitrogen this early in the season, and unless a nitrogenous top-dressing is applied the crop is held back to the detriment of the final yield.

Quickly available nitrogen, applied just as soon as the frost is out of the ground, will stimulate stooling and result in more and better filled heads. Where the stand of wheat is a little light this increased stooling is absolutely necessary, if a normal crop is to be obtained.

Experiment on the Farm of M. Kindig, Seville, Ohio. Gain from Top-Dressing with Sulphate of Ammonia, 13 bushels per Acre.

Arcadian Sulphate of Ammonia

Arcadian Sulphate of Ammonia is the ideal top dressing fertilizer. It analyzes 25½ units of ammonia, all soluble and quickly available. Being a non-leaching fertilizer the application can be made as early as needed and less will be required to produce results.

Arcadian is fine and dry and can be applied evenly and uniformly by hand or with the grain drill. Fifty to one hundred pounds per acre is sufficient.

Arcadian is for sale by the larger fertilizer dealers and their agents.

Making Lime-Sulphur on a Big Scale

By J. P. STEWART

PART of the interest that we anticipated in reducing the costs of production in fruit growing this coming year are shown in the letter which follows. The writer in this case is evidently tackling the matter of making his own spray materials on a very large scale. His plans and inquiries may be of interest to others.

The writer wishes to be advised as to your recommendations for the making of lime-sulphur solution with steam, and as a guide to such recommendations submits the following data and questions:

We have available a 15 H. P. steam boiler, and wish to cook 1000 gallons of concentrate at one time. It is planned to run the solution directly into 50 gallon barrels as soon as cooked, as our neighbors depend upon our plant for their supply. The sediment will be removed for the most part by screening, although the sludge passes on thru with the solution. This sludge, by the way, is considered a valuable ingredient by our growers, as it makes the solution show up more clearly on the trees, acting as a "marker."

What type of screen would be advisable for us to use when filling barrels?

Shall we use a closed steam coil, a perforated coil, or an open steam jet for cooking? Assuming a wood tank (cyl.) 6 ft. inside diam. and 6 ft. 6 in. high inside, about how many linear feet of 1-in. pipe for coils, (steam pressure at tank say 60 lbs., initial temp. of water in cooking tank about 57 degrees), to boil the 1000 gallons of concentrate?

In our original cooking tank (direct fire) we used a mechanical agitator constantly. Will this be necessary with either closed or perforated coils?

A tank to hold 1000 gallons of solution should be larger to provide for the boiling up and "foaming" of the solution while cooking. A tank 6 ft. x 6 ft. 6 in. holds roughly 1350 gallons. Would you consider this a well proportioned tank for the purpose?

The matter of stones in poorly burned lime is always troublesome. These accumulate in the bottom of cooking tank as you know. It has occurred to us to use a large basket of heavy close-mesh wire to fit rather neatly inside the cooking tank to catch these stones and other sediment. This basket could be hoisted out when necessary without having to empty completely the tank. If an agitator were used it might interfere with it, what suggestions have you along this line?

We have always made a practice of reducing the sulphur to a paste before adding to the cooking tank. Do you recommend this? Is there any advantage in adding the sulphur either before or after putting in the lime? We use freshly burned lump lime.

According to the formula we use, 1000 gallons of concentrate will require 1000 lbs. of lime, 2000 lbs. of sulphur and 1000 gallons of water. Just how should we proceed with these larger quantities to avoid "drowning" the lime? Is this 50-100-50 formula as efficient in utilization of materials as any other?—W. P. M., Virginia.

Taking these points in the order presented, I would advise the use of a tinued iron wire screen for the strainer, made with about twenty meshes to the inch. I would also prefer a strainer of the type which strains the material upward thru the screen, instead of downward, the directions for the construction of which have been given before in this column. A strainer of considerably greater capacity than the one previously outlined would be preferable here, however.

The best results with steam cooking are obtained by the use of a perforated coil or pipes, with the perforations all being made on the same relative side of the pipes, so that the escaping steam will tend to develop a good swirl in the mixture and thus reduce the necessity of stirring. Two pipes in the form of a cross, and as long as the diameter of the cooking vessel will permit, should be sufficient to do the work if the boiler will furnish the steam fast enough.

Stirring would be needed with a closed coil as much as with a direct fire. It should not be needed so much with a perforated coil however, but the amount actually needed in the latter case would have to be determined by the results secured.

I would consider the proportions named very satisfactory for steam cooking, and would expect that a margin of even 250 gallons, or 25 per cent, should be ample to prevent any appreciable loss from boiling over.

The wire basket suggested should be entirely practicable, but if one gets the right kind of lime—well-burnt and high in calcium, at least 90 per cent CaO, and then use only enough water in the slaking to keep it coming right, the basket should not be necessary.

It is not necessary to reduce the sulphur to a paste before adding it to the cooking tank, provided sufficient facilities are available to sift the lumps out, and to reduce it to the desired condition in the cooking vessel, which is much easier than to mix it with water directly. It also makes no special difference just when the sulphur is added, but the lime usually slakes better if it has a chance to get well started before the sulphur is added. Freshly burned lump lime that is high in calcium is the best kind to use. I would use only enough water at first to get the lime started slaking. It should not be covered with water at any time prior to the start of the slaking, and it may be that better results are obtainable when the slaking is completed before the additional water and the sulphur are added.

The formula indicated—1-2-1—makes a very satisfactory product from the viewpoint of both storage economy and utilization of materials. For the best utilization of materials, however, we have found that an increase in the volume of the product of about a third, which should be maintained thruout the cooking, will give materially better results. A typical formula under the latter relative volume, is 45-90-60, which makes up very nicely in a 70 or 75-gallon cooker.

True apple blotch is not so difficult to control, judging by the experiences of Iowa apple growers who spray continuously and consistently thru the growing season. However, it is harder to control than the sooty blotch. I quote Robert Clark, an Iowa orchardist, who has had remarkably clean fruit year after year: "We and others whose experience I am acquainted with have been able to control true apple blotch with Bordeaux mixture 4-4-50 or 5-5-50. This will give effective results when applied in an extra spraying about three weeks after the ten day application. This is the last week of June in this country."

"Up to 1920 I believe most expertment stations recommended Bordeaux in this special June spray."—E. A. K.

VALUE OF GROWING CLOVER

I have yet to see the farmer who has succeeded without growing clovers or some equally good legume. There is a steady influence in the adoption of a system that includes them as regularly as they may be grown. If others cannot succeed without them, how may we expect to continue our farm operations on a profitable basis if we fail to sow the seed when it seems that seed prices are a little out of proportion to the prices of other farm products?

Last year we paid what I thought was high prices for our seed. Seed I ordered in January cost \$30 a bu. It took like putting a lot of money into such a little bit of seed. But as we had not failed in thirty years to sow clover seed, and knowing how handicapped we should be without one-third of the farm in clovers, every acre that was in small grain was seeded to clover when conditions seemed most favorable.

My records show the cost of seeding last year to be as follows:

Alsike, 5 lbs.; timothy, 3 lbs., \$2.82 an acre.

Sweet clover, 9 lbs., \$2.85 an acre. Alfalfa, 7½ lbs.; alsike, 2½ lbs., timothy, 1½ lbs., \$3.28 an acre.

Big English, 6½ lbs., \$3.75 an acre.

Excellent stands were secured with all these seedings. We did not at that time look for such economic conditions as exist this year, but having our regular clover crops made it much easier to plan our operations for the coming year and gives us a chance to practice economies that would not have been possible had we omitted seeding just because the prices seemed too high to justify sowing. Our work and plans will not be unbalanced as they would have been had we left out the clovers. As viewed today, it may seem like a big price to have paid for the seeding, but when the numerous benefits are counted, it would seem that it was more than worth the cost.

This year will find us seeding clovers again as usual, because we cannot farm to advantage without them. If they should be omitted, next year would find us with an abnormally large oats or corn crop, or both, as they or soybeans would have to be grown to take the place of the missing clovers. While we grow soybeans also, it would not be advisable to make them entirely replace clovers because of the great amount of labor required to grow them and a corn crop also.

While the cost of clover seed is much less this year, it is relatively little or no cheaper, I believe, compared to prices of other farm products. A bushel of corn will not buy as much seed this year as it did last year. Just at present corn, locally, is 55c a bushel and clover seed is about \$12 or more. A bushel of wheat or rye will buy more clover seed this year than it did last, and yields of both these crops are maintained or increased by growing clovers in the rotations.

It would not seem to be very good policy to wait for clover seed prices to get lower before sowing, for much may be lost in the meantime—unless soil conditions are such that it is difficult or impossible to secure a stand. Don't be completely discouraged because red clover and alfalfa fail to catch or because the stand is thin. Perhaps the land may need doctoring—draining or liming. Perhaps there isn't enough money now to carry out the improvement required in the soil to better adapt it to red clover; most of us have experienced such a time.

It is very likely that it can be handled so that it will have a legume crop on it while soil improvement is being made over a period of years, as funds permit.

Alsike will grow on undrained and cold wet soils much better than red clover, though it is not quite as good a soil improver because it is more shallow rooted. The seed is small, making it a little cheaper to seed. If you have damp, undrained spots in fields try alsike and timothy in them; they make an excellent hay crop. We have made heavy cuttings from such seedings. Just enough timothy should be used to hold up the alsike, unless the hay is desired for horse feed when more timothy may be used.

Sweet clover is a great soil improver, but it will not do well in a cold, wet soil like alsike. Sweet clover does not thrive on sour land. However, it will often do better on a thin run-down soil than clover or alfalfa. Where we grow sweet clover and soybeans we have no trouble in getting corn crops.

Whenever we let any of these clovers go until the latter part of April of the second year for soil improvement purposes they do wonders to the corn crop if they are disced up well and plowed under and the ground disced again soon after plowing to open and pulverize the soil so as to hasten decomposition of the clovers. It is well to remember that there are several ways of handling clover to make it profitable. But it seems to me that waiting for the seed to get cheaper before sowing is one of the most unprofitable methods to pursue when clover can be grown.

—J. L. Justice.

The silver lining to the passing cloud

Ever hear the old saying "High-priced seed means a low-priced crop"? Ever notice that the reverse is equally true—and that today's situation should therefore spell OPPORTUNITY to the farmer who has "his ear to the ground and his eye to the future"?

He knows that over-production never occurs two years in succession. He is assured better distribution of next season's crops because of greatly improved transportation conditions.

That is the "silver lining" the wideawake farmer sees on the cloud of low prices now passing. While others are waiting, he is acting. And when the rise comes his crops are ready; he "cashes in".

He is going to use fertilizers—good fertilizers. For he is the kind of farmer who never thinks of missing the profitable extra yield they produce. He is ordering them now—to avoid last-hour rush and probable delay in getting them.

A A C Fertilizers carry extra-yield assurance because they are good fertilizers. They are good fertilizers because they are made RIGHT. Have you ordered yours?

Protest Daylight-Saving

AT THE TIME this is written (February 12) we have received protests against the daylight-saving plan from 7,455 people in Pennsylvania, 1,337 in New Jersey, 951 in New York, 140 in Maryland, and 43 in Delaware.

We doubt if there ever was a subject before the farmers on which they were so fully united as they are upon this one. In the great majority of letters containing a protest was a note saying that the farmers in writer's neighborhood were unanimously against it. Out of the almost 10,000 votes received, but a single vote was cast in favor of the daylight-saving plan, and the writer gave a street and number in Pittsburgh as his address.

We will present these votes and petitions where they will be most effective in all the states. If the law makers have a regard for doing the thing which will be most appreciated by those whose business depends almost entirely upon a full utilization of the time in summer they will vote against the bill to establish daylight-saving in Pennsylvania, and vote for the repeal of the law in other states.

A few extracts from the hundreds of letters received will be found on page 28 of this issue.

Honest Advertising

IN REPLYING to our request for suggestions and comments on Pennsylvania Farmer a woman wrote as follows:

"We gauge the responsibility of a farm paper and estimate its value to us quite as much by the character of the advertisements it carries as by its editorial matter. We have found that if a paper carries advertisements of unreliable firms or questionable enterprises its reading matter is also of an inferior sort. Farmers come to depend upon the farm paper they read and all publishers should feel their responsibility in this matter. For this reason we are regular subscribers to Pennsylvania Farmer as one of our three farm papers."

Comments of this kind are highly appreciated. One of the steadfast principles upon which Pennsylvania Farmer is based is, that so far as it is humanly possible to insure it, the advertisements as well as the text matter are true and reliable. Aside from the fact that most men and firms, under ordinary circumstances, do business upon a moral basis, there is the well founded belief in the truth of the old maxim, "Honesty is the best policy."

Pennsylvania Farmer

Back the Bill for a State Fair

CONSIDERING the unanimity with which the proposition to establish a State Fair in Pennsylvania was seconded by the farmers and farmers' organizations of the state, the very general interest in the subject by all classes and the recommendations made by the Governor it would seem as if there should be little opposition to the passage of a law establishing a State Fair.

But it seems that a small group of people known as the Pennsylvania Fair Association, which is composed of the officials of some of the county fair associations, have become alarmed. They fear that a State Fair would overshadow and thus injure the county fairs and have started a campaign of opposition to the establishment of a State Fair. The association held a meeting at Green's Hotel in Philadelphia last week and adopted strong resolutions on the subject.

A reading of the resolutions adopted and the speeches made show plainly that these promoters of county fairs have little knowledge of the actual effect of a good, state fair upon the development of county fairs. If they would but investigate the matter they would find that the states having the best fairs also have county fairs that far outstrip the present county fairs of Pennsylvania, and that the county fairs are in reality agricultural fairs, something that is not true of all the so-called county fairs in Pennsylvania at present.

Those who are backing the State Fair project, and they are the real farmers and farm organizations of the state, have no desire to injure in any way the county fairs, and they are convinced that one will help the other. The success of our excellent State Products Show is largely due to smaller district and county exhibits—the latter being inspired by the anticipation of competing at the State Show. The same principle works in relation to county and state fairs where they exist.

We dislike to impute wrong motives to the county fair association, but they have started opposition to a well intentioned project, introduced and backed by the rank and file of the farmers of the state, and as spokesmen for farmers of the state, and we mean to fight for a State Fair to the end. The real bone of contention is discovered in the reported speech of the secretary of the association, part of which is as follows:

"County Fairs are the last enterprise that should be so many times attacked by adverse legislation, considering the great good they do for the public of Pennsylvania and their own vicinity. The great helping hand County Fairs are for the betterment and promotion of agriculture, it seems as if they wanted to bite the hand that has helped so long to feed them, being the most ungrateful act that any human being could foster for the machinery of agricultural progress."

"The session of Legislature of 1921, of Penn-

One has but to turn to the files of papers and magazines published a generation ago to see the change that has taken place in the kind and character as well as the appearance of advertisements. Instead of the uncensored, extravagant claims made for anything a producer might wish to foist upon a gullible public we have in the reputable papers advertisements only of reliable and legitimate articles, prepared by men who make it their business to say the most in the fewest words and in the most convincing manner.

Advertising is recognized as the cheapest and most effectual method of introducing and selling goods. It is universally recognized by producer and buyer as the most legitimate and logical means of conveying a knowledge of the world's products and of man's needs and luxuries. In these days of quick and wide dissemination of knowledge, every intelligent man knows that he cannot misrepresent his products and remain long in business. Most men covet a reputation for honesty, and since he knows that what is down in "black and white" cannot well be repudiated, his advertisements are likely to be dependable. When there is added to this the careful scrutiny and investigation of the reliable publisher, the reader is doubly protected against the possibility of fraudulent advertising.

sylvania, is now in session and while only fairly started, several bills have already been introduced that compelled me as your secretary to previously ask you for your co-operation at once. That is, to interview your Senator and members of Legislature of your county, that you are to explain to them the hardships these bills if enacted as a law would be to the County Fairs' future success and continuance. Be sure to get their pledge to vote against adverse legislation and support any or all bills that are a benefit to County Fairs without your support; otherwise my efforts are all in vain.

"Our state appropriations are getting smaller in place of larger. The more work we do the less pay we get, with all our continually increasing costs to maintain a fair, our state appropriation should be double, and next should be paid to us with a willing feeling not with a reluctant look. We as County Fairs have been here many over a half century, being here first and not fully provided or cared for. There should be no new addition to the fair family or any new adoption."

There we have the trouble in a nutshell—the fear that a State Fair might jeopardize the appropriations to the county fairs. We believe that such a fear is groundless. The effect of a state fair is to supplement, not supplant, the county fairs, and those worthy of state support will likely continue to get it. It may be said in this connection that some county associations fail to receive their appropriations because the fairs are not run in accordance with the law.

As far as we are acquainted with county fair managers we are safe in saying that the majority of county fairs are not conducted or managed by genuine farmers. In many instances the name agricultural fair is a misnomer. The term is frequently used to cover what is little more than an exhibition of horse racing and questionable side shows, and the agricultural exhibit is almost negligible. In many cases the swollen attendance figures cannot by any stretch of the imagination be construed to mean that the farmers of the county are in sympathy with the management of their county fair.

As reported in the daily papers the officials of the organization attacking the establishment of a State Fair elected for the coming year are as follows: Al White, Indiana, president; Walter Buckman, Byberry; Abner S. Deysher, Reading; C. R. Cummins, Erie; C. R. Brennan, Altoona, vice-presidents, and Jacob Seldondridge, Lancaster, secretary-treasurer. The executive committee is composed of: John Bollman, Lebanon; S. H. Russell, Lewistown; Herbert C. Heckert, York; J. H. Maust, Bloomsburg; Harry B. Schall, Allentown; Hon. N. L. Strong, Brookville; C. C. Smith, Warren; H. O. Holcomb, Conneaut Lake; W. H. Deeter, Myersdale, and J. L. McGough, Myersdale.

We are not in any way questioning the integrity of these men, but we would like to know how many of them are farmers, or how many are duly elected by farmers to represent them.

Our Washington Letter

Notwithstanding the reports that wool consumption for December showed a decrease compared with the preceding month; that on January first 54 per cent of the wool textile machinery in this country was idle, and many cargoes of wool have arrived here or are headed for American ports, there is an encouraging trend in the wool market. According to the wool market specialists of the Department of Agriculture there is now a better market for domestic wools than at any time in the last three months, with a better demand and better prices. They report that territorial wools are in demand on the Boston market at prices ranging from 85 to 95 cents a pound on a scoured basis. There is a scarcity of fleece wool reported, with stocks on hand small.

Vast quantities of wool are coming into this country. There has always been a rapid increase in wool importations during an agitation in Congress for higher duties and just before the enactment of a protective wool tariff. This wool now coming to our shores, however, is low grade and does not come directly into competition with our domestic wools.

The latest development in the so-called adulterated butter tax situation is the information that Commissioner of Internal Revenue W. M. Williams has refused to make any concession to the butter manufacturers, except to postpone the date of the ten per cent tax becoming operative until April first. In the meantime a hearing will be given on February 25, before the Internal Revenue

February 19, 1921.

February 19, 1921.

Pennsylvania Farmer

7-207

enue Commissioner, for the purpose of giving the butter producers an opportunity to present their case.

This butter tax, if collected, will hit the packers to the extent of several million dollars a year, as they are among the large distributors of centralized creamery butter. It is claimed that this tax will effect the entire carton butter business in the United States.

A hearing will be held before the House Agriculture Committee February 15, on the Dyer bill to remove the tax on colored oleomargarine. This is the first time oleomargarine legislation has been taken up during the present session.

The Maryland-Virginia Milk Producers' Association, supplying Washington with milk, has decided to operate a plant in or near Washington, for the purpose of manufacturing the surplus milk of the members into butter, cheese and other products. The association has reduced the price of liquid milk from 44 to 36 cents a gallon.

After an unsuccessful attempt on the part of the friends of packer regulation to get the Senate bill reported out without amendment, the committee on Agriculture ordered a favorable report on a substitute bill, which places the control of the packers with the Federal Department of Agriculture, and places the stock yards under the jurisdiction of the Interstate Commerce Commission. The Senate bill creates a live stock commission to supervise the meat packing industry.

The American Farm Bureau Federation and National Grange representatives are working actively to get the packer bill out onto the floor of the House for action this session. It is the opinion of close observers in Congress that if the bill could be brought to a vote it would pass the House. The debate has been limited, and prospects are fair that the measure will be voted on by the 15th of this month. It is also hopefully predicted that the Senate bill will be presented for action on the floor of the House instead of the one reported out by the Agriculture Committee. This is believed to be the only possible chance of its becoming a law during the present session.

The friends of packer control legislation are confronted with a new and serious opposition to their measure, the United States Chamber of Commerce. Copies of their brief containing arguments against the proposed legislation have been sent to members of the Senate and House, and there has been sent out from the Washington headquarters of the Chamber to the 1400 organizations and more than 15,000 corporations, firms and individuals included in its membership, a request that they lend their assistance in opposing the legislation. This emphasizes the efficiency of the business men's organization in lining up their support or opposition to any measure before Congress, and also the necessity of the many farmers' organizations federating their interests under one great representative overhead organization, similar in its plans and methods to those now employed by the United States Chamber of Commerce.

The Chamber points out what it terms "the force of voluntary registration as proposed in the Senate packer bill." The measure provides that packers may register or not, as they wish, but to those that register the government grants special favors, such as assistance in procuring cars and the dissemination of information which it is alleged would place those not registering under serious competitive handicaps. The effect of the provisions would be to force corporations engaged in this business to register. Once they are registered the government assumes a control of the operation of the business that is equivalent to actual government operation.

The Chamber's Brief contends that this is the first time that the Congress has seriously considered taking control of the entire functioning of a private industry thru a government commission.

The Dairymen's Co-operative Sales Company of Pittsburgh, supplying the Pittsburgh district with liquid milk, has begun active work in its territory, comprising several counties in Ohio, Pennsylvania and West Virginia, to raise funds for the proposed Temple of Agriculture in Washington.

An amendment to the general Agricultural Appropriation bill, introduced by Senators Swanson and Glass of Virginia, authorizes the Secretary of the Treasury during the fiscal years of 1921-1922, to purchase at par and accrued interest, with any funds in the Treasury not otherwise appropriated from any Federal land bank, farm loan bonds issued by such bank. Such purchases shall not exceed the sum of \$100,000,000 in either fiscal year, shall be made only upon recommendation in writing of the Federal Farm Loan Board, and the bonds so purchased shall bear interest at the rate of 5 per cent per annum.—E. Reynolds.

HARRISBURG LETTER

A Question of Cash.—This session of the Legislature seems to have settled down to more of a

discussion of state funds than anything else and question of how much cash the general assembly will have to apportion is in reality attracting more attention than anything else. Generally, there are a couple of big legislative problems which form the chief themes, but this is the first session in years in which the alk has revolved so much about the funds. And yet no one can foretell now what the sum that can be safely appropriated will be. The Governor is talking about \$90,000,000, which means the income without new laws will shrink as compared with last year, while some legislators believe it will be closer to be closer to \$100,000,000. Powerful opposition will be manifested to the proposed coal tax of two per cent, to any tax on manufacturing capital and other forms of taxation and already theatrical interests are going after the amusements and billboard taxes. One of the greatest drawbacks to getting the session started is this uncertainty over the revenues. As soon as it is decided whether there will be any new revenue laws or not, things will begin to straighten out.

More Interest Asked.—Probably one of the most interesting addresses made in a long time was that delivered by the new Auditor General-elect, Samuel S. Lewis, who demanded that the state puts its money out at competitive bidding for deposits, as is done by many counties and cities. The state now gets two per cent and the depositors are selected by state officials. Mr. Lewis contends if the state has to pay more interest on its bonds there is no reason why it should not get more than two per cent on its deposits, which run into millions, and that every bank that can produce proper security ought to be able to bid for them. The deposits would be regulated by a state board already in existence, but never given a chance to do much. The speech has had the effect of waking up a lot of people to what has been going on and coming from a man who will soon step into the powerful office of Auditor General created a stir at the Capitol. The Lewis ideas will be incorporated in one of a series of bills designed to better the state's fiscal arrangements.

Are You Going to Build?

IF YOU contemplate building a house, barn, wagon shed, garage, tool house, milk house, or any other farm building, send us a rough sketch of the plan you propose, together with an estimate of what you are willing to spend for it. Also, state your preference of material. We will have plans drawn and suggestions for building prepared and mail them to you, reserving the right to publish those which would be of general interest. Mail them to us before March 15.

The New Constitution.—Hearings in regard to the bill for a constitutional convention may not be asked, according to some reports being heard here. Instead it is probable the bill may be pushed right thru to votes in the two houses so that the opposition may expend itself upon the floor. A number of interests are said to be against the plan of submitting a convention to the people, holding the time is not ripe, but the Governor is determined to go ahead with the plan as he is with the coal tax.

New Seed Bill.—Secretary of Agriculture Fred Rasmussen has about finished work on his new seed bill, under whose terms he believes it will be possible for the state to undertake a great deal of work of benefit to the farmers of Pennsylvania without much cost to individuals. The secretary is planning a system of requiring seeds to be sold under guarantees, for tests by the state and for stringent penalties. Now the state sends out men to sample seeds, but it is hoped to be able to supplement this inspection by offering farmers free examinations if they forward samples. This has already been done to a limited extent.

New State Fair Bill.—Plans are being made at the Department of Agriculture for a new bill to establish a State Fair, under the suggestions adopted at various meetings held here and elsewhere in the last year. The measure already in hand may be used in part, but the State administration is planning to submit its own bill. The Governor and Secretary are both of record as heartily favoring the State Fair project.

After the Thistle.—Steps whereby township and district authorities may hire men and teams to exterminate the Canadian thistle have been provided by a Senate bill. Under the present law the pay allowed is so small that the securing of men to do the work is almost impossible. The new plan would enable the state to pay the prevailing prices and get some action in destroying this pest. It is probable legislation supplementing the law on weeds will be introduced so that there can be effective work against the score or so of varieties that have gotten starts in the periods when farm labor was scarce.

Want to Fight "Yellows."—One of the inter-

esting facts connected with Department of Agriculture work just now is that so many orchard owners are asking for state aid in fighting the peach "yellows." They have figured out that the way to head off the pest which is reported sweeping up the state is to get started. An item to pay for the start of inspection is to be presented.

More Demand for Bounties.—The figures of the State Game Commission show the demand for bounties for skins of foxes, minks, weasels and other animals was not as heavy as expected last year, but that there has been a big demand for the pelts lately. The mild weather has enabled many boys to get after the pests and it is believed the total for this year will exceed that of 1920.

Closing Institutes.—Plans are being made for closing of the county institutes and the attendance is declared to have been better than anticipated. No regrets have been expressed at the changes in schedules or meetings, but the attendance at one day meetings has in some cases been better than the old two-day stand.—Hamilton, Harrisburg.

NEW YORK LETTER

For Slain Cattle.—In the deficiency bill for 1920 one item will be appreciated by farmers, if paid. This item calls for \$245,276 to reimburse owners of cattle found infected with tuberculosis, and which have been slaughtered to prevent spread of the disease. State agencies and organizations are pushing tuberculosis eradication, which can never succeed except as farmers are reimbursed for these losses. For the first time in years the price allowed by the state is reasonably close to the market value of the ordinary grade cow, and thus conditions are more favorable to developing the accredited herd.

Fertilizer Prices.—Farmers are urged to mix their own fertilizers this year, due to high prices on ready mixed stocks. New York farmers are doing this more than ever before. There has been a drop in fertilizers, but agriculturists consider prices still too high. It is believed that European agencies will bring a further drop in potash, which is now \$62.50 a ton. Nitrate of soda is \$55, sulphate of ammonia, \$58; rock phosphate \$4, and acid phosphate in bulk, \$14.

Farm Bureaus Celebrate.—The tenth birthday of the Farm Bureau will be celebrated in New York on March 20 and 21, at Binghamton where the first farm bureau was created. Prof. J. H. Barron, now of the state college, and known to farmers as the expert who selects their improved seeds in the northwest, was the head of the first farm bureau, as county agent. In the ten years the membership has grown to over a million, and every state in the Union but two now has this most powerful organization working for its farmers. Officials of the state and national federations will help to commemorate the event.

Wonderful Ice Season.—Plenty of men and plenty of best quality ice, also good clear weather has made the ice harvest a noteworthy one. No ice has been cut on the Hudson as yet or on the Susquehanna.

NEW JERSEY NEWS

Moth Campaign.—Operations tending to the eradication of the gipsy moth in New Jersey are now under way, and with the appropriation of several hundred thousand dollars by the state under a bill of the present session of the Legislature, very active work will result. There were three infestations in Morris County and the state is sending in a large power sprayer to use on some of the infested orchards in that section.

Roads Convention.—Trenton is to have the biggest road convention in its history, and for that matter, the most important in New Jersey, on Feb. 23, 24, 25 and 26. Addresses are to be delivered at the meetings by such men as W. D. Uhler, State Highway Engineer of Pennsylvania; H. S. Mattimore, testing engineer of the Pennsylvania State Highway Department; Charles M. Upham, State Highway Engineer of Delaware, and F. H. Colburn, State Highway Engineer of Massachusetts. The convention will be conducted under the direction of the New Jersey State Highway Commission. Thomas J. Waser, New Jersey State Highway Engineer, will take the leading part in the holding of the meetings.

Farmers Advertise.—Plans for co-operative selling of potatoes by raisers in Central New Jersey were made at a big meeting held at the Mercer County Court House at Trenton last Saturday under the direction of the Farmers' Co-operative Association of the county. The purpose of the gathering, which was attended by agriculturists from many points, was to sell the potato crops in Mercer and other counties in this part of the state.

Legislature Meeting.—The Eldridge Daylight Saving bill, which advances the clock one hour from the last Sunday in April to the last Sunday in September, was given a hearing last week by the House Judiciary Committee in the Assembly Chamber at the State House with many opponents present from the farming sections.—Kelly, Trenton.

It is the Engine's Turn to Turn

EVERY dairy farmer who handles a large volume of milk knows that turning the easiest running cream separator in the world by hand gets to be monotonous work before the day's run is finished.

The **Primrose Direct Power Drive** has simplified greatly the matter of separation on a considerable scale. This practical little addition to Primrose efficiency can be attached to any hand-operated **Primrose Cream Separator** and does not interfere in any way with hand turning of the separator.

By means of this simple attachment, direct connection can be secured with an engine without speed-reducing gear, to a line shaft or portable electric motor.

If your milk volume has reached such proportions as to make separating a real task, then it is most certainly the engine's turn to turn. A **1½ h.p. International Kerosene Engine** and **direct-power-drive Primrose** will shoulder the job and handle it efficiently.

THE PROPOSED MILK LAW

In reference to the proposed milk law will say that for the last eight years or the last four sessions of the Legislature similar bills were introduced and always defeated and mainly thru country members of the Legislature, however in my opinion the proposed milk bill seems to be the most impractical one ever introduced.

This bill would be very detrimental to the small milkman and dairy farmers and be a great hardship to the consumers, the latter would probably suffer more than anyone else as it would undoubtedly greatly increase the price of milk without benefiting any one with the exception of the large milk distributing concerns and pasteurization plants who I always found were the main promoters of such legislation, their main object being to control the price of milk and keep farmers and milk peddlers out of the market. The facts are that the farmer, dairymen, and milk peddlers are not lobbyists and generally do not know it happened till it is done.

If this bill is passed and enforced it will compel the bulk of the milk to be pasteurized and the facts are that pasteurized milk is dead milk and not near as valuable or as good as raw milk and all the hospitals, tuberculosis sanitariums and state institutions are using raw milk, this I found out while inspecting these institutions as a member of the Appropriation Committee for the last two terms during which time I visited most of the institutions in the state and always made it a point to find out what kind of milk was used in each institution.

I also want to say that the idea that raw cow's milk carries diseases like typhoid, smallpox, diphtheria, etc., is erroneous and not true as cows do not have those diseases. It is also generally known that bovine tuberculosis is not human tuberculosis and I never had any proof that human beings died of bovine tuberculosis.

Another erroneous idea that they are trying to impress upon the consumers is that farmers and dairymen are dirty which is not true as the facts are that they are the cleanest and most particular people in the state and if the weak invalids and infants were fed more of their raw milk the death rate and sickness in the state would be greatly decreased.

Some years ago Dr. Dixon made an inspection tour thruout the state and after the inspectors had gone thru our township at least half of the dairymen came to me and wanted to sell out but after I explained to them that there was no law to compel them to make sun parlors of their stables they decided to keep on and if this bill as proposed is passed and enforced I have no doubt that that one-half of the dairymen and small milk dealers will go out of business as they cannot stand such drastic legislation and make a living.

The State Health and Live Stock Sanitary Boards have ample laws now to prevent the sale of unhealthy and undesirable milk.

The proposed milk law would probably work the greatest hardship on the school directors of the various townships as I find the school

directors in our county for the last few years have enough trouble in enforcing the compulsory school law without adding other duties for which they receive no pay.—**W. M. Benninger, Northampton Co., Pa.**

COURAGE OF LEAGUE MEMBERS

The members of the Dairymen's League have just received notice that the price of milk has been fixed by the League officials and a committee from the Conference Board for the month of February at \$2.53 a hundred for three per cent milk. This is the lowest price in many years, and at present writing we are not sure that the dealers will sign up at even that low figure, although the probabilities are that they will accept, as the committee of the board has recommended that they do so.

In spite of this low figure which really is way below cost, the rank and file of our dairy farmers are hopeful and filled with courage; for they see the time fast coming when they will be in a position to control their own business. The lower milk goes the faster the farmers send in their contracts signed up for the new pooling system. There are those that believe some such thing was needed to hurry the men up about doing this. For a while they hesitated, fearing all sorts of things, most of which had no basis of truth, one being that if they signed the contract if things did not for a time go right the League might take their farms or anything they had to the last cent. It has been a part of the propaganda of the big companies to pester the farmers with the most foolish and absurd arguments possible in the effort to keep them from adopting the pooling system and so breaking down the League. But they are not going to win. The rank and file of the farmers are standing together firmly and declaring now that they will see the fight thru if it takes all summer. They will do it, too.

The League is bringing its offices to Ithaca, N. Y., right up to the doors of the great central New York milk producing section. That will make it easier for delegates to reach the meetings that are held and in some ways prove an advantage.—**E. L. V.**

LEAGUE PRICE FOR FEBRUARY MILK

The producers' price for milk in Dairymen's League territory during February will be \$2.53 per hundred pounds for milk testing three per cent butterfat, at the 200-210 milk freight zone, with the usual freight and butterfat differentials. This is a reduction of sixty cents a hundred-weight from the January price, or about one and one-quarter cents a quart.

The reduction in price is due to a surplus of milk caused chiefly by the continued refusal of the manufacturers to buy milk for manufacturing purposes. The milk market situation is bad. Manufacturing plants are still shut against the farmers. Many farmers are facing financial disaster because of their inability to market their milk for anywhere near what it is worth.

There is every evidence now, however, that farmers are about to go

A Better Way of Milking

The De Laval Milker

THE FUTURE of the dairy business is dependent on a better way of milking. Think of the loss in time and loss in production of milking the twenty-five million cows of the United States and Canada twice a day by hand. No other industry of equal importance is laboring under such a handicap, and every year it is becoming increasingly difficult to secure good hand milkers.

The De Laval Milker is the greatest aid to one of the nation's greatest industries. It is a better way of milking. Better because it saves time. Better because it milks the cows with absolute uniformity from day to day, which De Laval users claim actually increases the flow of milk even over good hand milking. Better because it is easy to keep clean. Better because it is built to De Laval standards. And better because it is backed by De Laval service.

The De Laval Milker is ready to serve and save for you now—write for full information.

SMITH BANNER
No. 22
COMPRESSED AIR SPRAYER

Every Farm Needs It Daily—
the Year Around

Sprays trees, shrubs, potatoes and field crops for insects and fungus; sprays stables, pig and poultry pens; barn yards for lice and vermin and for disinfecting. Also can be used for whitewashing stables, poultry houses and fences. It's handy too, for washing windows, buggies, autos and for spraying cattle.

This sprayer is sturdy; tank is made of heavy brass or galvanized iron; capacity 4 gallons. Pump is two inches in diameter, seamless brass; brass castings; nothing to rust, corrode or wear out. A few strokes and you have a strong pressure to deliver long-distance fine mist or coarse spray through the Automatic, Brass, Non-cloggable Nozzle. Does not waste liquids. Easily operated by man, woman or boy.

The No. 22 Banner is built for long, hard service. Be sure and ask your dealer for it by name.

If your dealer cannot supply you, write

Bankers Say—

**"Buying good fertilizers
is good business"**

EVERY progressive farmer knows that the quickest and surest way to increase his bank deposits is to increase the fertility of his soil.

Farmers who have used GRO-ALL Fertilizers say there are no safer or more efficient builders of soil fertility. They prefer GRO-ALL Fertilizers

- because they are well balanced, highly productive plant foods
- because they are economical, and
- because they grow the crops that swell the bank deposits.

No matter what conditions prevail, a good crop means bigger cash returns than a poor one. Especially under present conditions GRO-ALL Fertilizers are an economy—they will fill the far-sighted farmers' barns with money crops.

Our prices have been sharply reduced.
Take advantage—order your supply of
GRO-ALL for 1921 Spring's work now.

Spray Pumps for All Uses

THERE are spray pumps suited to every need of the farmer, but it cannot be said that there is any one pump that fills every need. The type that fills the bill for the small orchard is hardly suited to the commercial fruit farm and the apparatus that is suited to the modest requirements of the home garden will not do for the large potato grower.

First are the small machines, or atomizers, holding a quart or two of liquid and suitable for spraying house plants and small garden work. Next in size come the automatic and knapsack sprayers. Knapsack sprayers will answer the purpose for gardens and small areas. This type of sprayer is not, however, used so much as the automatic. The knapsack is carried on the back, one hand keeps the pump constantly working while the other directs the nozzle. The automatic consists of a tank carried over the shoulder. This actually pumps air and the spray is delivered by air pressure. Fill the tank about two-thirds full, then put on the lid and clamp it down. Work the pump until a good pressure is obtained, after which part of the liquid will be run out. Work the pump again and continue spraying until all the liquid is distributed. This type of sprayer has many uses about the farm and garden. A considerable amount of work can be accomplished.

For large acreage of potatoes a machine is required in which a continuous spray is given while the sprayer is being hauled along the rows. In this type of sprayer, the forward motion of the motive power furnishes the pumping strength. Such machines cannot be used for tree work, as the pump is connected with the wheels by chains, gears, or eccentric. The large potato grower usually includes this type of sprayer among his equipment.

We now come to the power sprayers. These are necessary for the orchardist with ten or more acres of apple trees. The largest orchardists have powerful machines capable of quick work and with tanks of considerable capacity.

One can decide if he needs a power sprayer by figuring the number of trees and how long it takes to spray each tree. Another way is to take into consideration the amount of spray material required for each tree and figure the number of trees. The farm and garden. A considerable amount of work can be accomplished.

A Motor-Power Cultivator

It will do for an acre of potatoes and a small home orchard of small trees may be successfully sprayed with it. It is also useful in the truck patch. It should be remembered in buying this type of machine that the galvanized iron tank will not withstand the action of Bordeaux mixture to any extent. The brass tank is more costly but probably will be found cheapest in the end.

There is another type of hand sprayer known as the bucket pump. It is useful in spraying a few small trees, or for work about the hen house and stable. It is not convenient for extensive work, altho its work is done in the same way as that of the barrel sprayer is done. The barrel sprayer will answer for a small orchard, say up to four or five acres. These are hand-operated, requiring the work of a good husky man at the pump handle and others, like the double-acting horizontal pump, being easy of operation. In the latter type of machine the man keeps constantly at work but it is not the back-breaking work required to keep the common barrel type delivering the goods. The best of these expensive method is to place one-half of an old barrel, a box with the bottom and top removed, or a small cold-tail. This kind of pump mounted on a one-horse wagon with tower for one man, while the other works from the ground.

EARLY GARDEN RHUBARB

Rhubarb can be had in the garden a week to ten days earlier than ordinarily, if provisions are made for protecting a few of the plants from cold nights and bad weather. An interesting method is to place one-half of an old barrel, a box with the bottom and top removed, or a small cold-tail. This kind of pump mounted on a one-horse wagon with tower for one man, while the other works from the ground.

Open the Winter Road to Town— Haul on Pneumatics

"The big Goodyear Cord Tires on my one-ton truck carried the supplies for my new home over roads that would prove impassable to less active and less powerful traction. Many a time the wheels were buried to the hubs, yet these sturdy pneumatics always pulled through. Without costing me a cent for repairs, and at a saving of at least 33 1/3% in gasoline and oil, they brought from Bentley, four miles away, 15,000 lbs. of iron, two carloads of brick, five tons of cement, 65 tons of sand, and 35,000 feet of lumber. Between times, they hauled five loads of hogs to market, returning with full loads of supplies. I hauled a carload of corn when I would have been overhauling the truck if I had tried to do all this without the air-cushioning support of pneumatics."—Arthur S. Witt, Farmer, Neola, Iowa

BOTH the work that Goodyear Cord Tires do, and the advantages they exhibit in mastering the severest conditions of farm hauling, are best described in such testimony as that furnished above.

The tractive power, the cushioning resilience, and the greater activity combined in the big pneumatics by their Goodyear Cord construction give the farmer a command

of the road in all sorts of weather, protect his truck and product, and make possible many an extra profitable trip.

The actual experiences of farmers the country over with motorization and pneumatics will be furnished to anyone interested on letter request to The Goodyear Tire & Rubber Company, Akron, Ohio, or Los Angeles, California.

How About Your Seed Potatoes?

"WHERE can I get seed potatoes that are practically free from transmissible diseases?" This is a question heard many, many times at the season of the year when potato growers are buying their seed stock. It is rather difficult to reply to the question because there are so few places where real disease free potatoes can be purchased.

In the past, potato growers have been satisfied to buy what is known as certified seed. To be certified, the seed must come from fields that show not more than 15 per cent of transmissible diseases at the first inspection and not more than 10 per cent at the second inspection. Such rules for seed certification are good, but they are not good enough for up-to-date potato growers who are demanding better seed each year, nor for the seed growers who keep the lead in putting clean seed on the market by recognizing the conditions and planning accordingly.

As an illustration, let us assume that a grower has purchased certified seed that shows only 10 per cent of transmissible diseases. If he buys 300 bushels of seed (enough to plant 20 acres), 10 per cent of the plants producing these 300 bushels are diseased, and basing an assertion on the field results that show diseased plants to yield not more than half as much as healthy plants, there would be from 12 to 15 bushels of diseased

The insect pests that destroy the vitality of the potato plants are the Colorado potato beetle and the flea beetle and these pests are satisfactorily controlled by spraying. The Colorado potato beetle may easily be controlled by an application of three pounds of arsenate of lead paste or 14 pounds of powder (or some other equally good poison mixture) to each 50 gallons of spray material. One or two applications of poison are usually all that are necessary to control the potato beetle. The flea beetle is controlled by an application of Bordeaux mixture. The Bordeaux acts as a deterrent to the insect, so that very little damage is ever done by the flea beetle where the vines are kept sprayed with Bordeaux.

Among the seed-borne diseases are the various forms of scab, the most commonly known being the common scab and Rhizoctonia scab, Fusarium wilt, leaf roll and Mosaic. Potatoes may be grown free from some of these diseases by treating the seed at planting time with formaldehyde or corrosive sublimate solution. Fusarium wilt can be readily detected by clipping a thin slice from the stem end of the tuber, for the black ring discoloration in the vascular bundles is an indication of Fusarium wilt. Leaf roll and Mosaic can be detected in the field during the growing season and the diseased plants can be eliminated very easily at that time. It naturally follows therefore that careful seed treatment before planting, examination of the seed pieces when cutting for planting, and careful inspection and roguing during the growing season by anyone familiar with foliage diseases will eliminate almost entirely the seed-borne diseases that have been causing a high percentage of loss in the potato crop.

The leaf diseases belonging to class two, are the late blight, early blight, and tip burn and can be absolutely controlled by spraying the vines consistently during the growing season, at intervals of a week or two weeks, depending upon the weather conditions. The most effective solution has been home-made Bordeaux mixture, using the 4-4-50 formula. When spraying is done, it is essential to bear in mind that the vines must be sprayed so that the under sides of the leaves are completely covered with the spray as well as the upper surface because disease infections (late blight particularly) take place on the under side of the leaf. The machine used for spraying must be so constructed that it will maintain a high pressure of from 150 to 200 pounds per square inch, this pressure being necessary for best results. Two or three nozzles to the tow have been giving good results but depend upon the way the nozzles are distributed on the spray boom at the back of the machine.

Seed certification is very necessary and is one way of making it possible for the potato grower to get seed that is fairly satisfactory. However, certified seed may not necessarily be disease-free seed. With our present knowledge of potato diseases and their control there is no reason why we should not have seed potatoes that are disease-free, or as nearly disease-free as it is humanly possible to produce them. The time is surely coming, and in some sections I believe has arrived, where it will be possible to buy practically disease-

Showing Normal Plant and Leaf Roll Plant

tubers in the purchase or enough to plant an acre of ground. Considering the yield from an acre of healthy plants as 200 bushels, the return from 12 or 15 bushels of diseased tubers would not be more than 100 bushels, or a loss to the grower of 100 bushels on account of the diseased seed. Had the 10 per cent of diseased plants been removed by the seed grower during the growing season he would have sold 15 bushels less for seed purposes but the 15 bushels could have been marketed locally and need not have been marketed up as a loss and the grower would have established a reputation as a grower of clean seed, while the man who planted the seed would have marketed a crop of 100 bushels more and he would have been a better satisfied customer.

Certain factors must be kept constantly in mind with reference to the production of clean seed. The most important are, insect injuries and certain diseases that affect the potato. These diseases are divided into two classes: seed-borne, and diseases that are leaf-borne.

(Continued on Page 29).

PUT THIS CONCRETE MIXER ON YOUR FARM

You can't afford to waste valuable time, good materials and money by having to do over again concrete work which was mixed by shovel. Get a Sheldon Farm Concrete Mixer and put in your own concrete so it will last a lifetime—it will save its price on the first job. What is more, you can do the work when you please in otherwise idle time. No big gang of men needed.

SHELDON PATENT CONCRETE MIXER
is made especially for farm use and has a reputation of six years of successful operation on thousands of farms all over the U. S. No complicated machinery to get out of order—easy to operate—easy to move—mixes 8 cubic feet at a batch—a 14 H. P. engine will run it. No other mixer excels its quality of work nor approaches its low price.

FREE—Now 1920 Catalog—FREE
It illustrates and describes all types of Sheldon Mixers and gives all of the prices. It tells about our special 30-day trial plan and tells you how to save money on your concrete work. It's FREE. Get this book today.

WAS CONSOLIDATION TO BLAME? CLIPPING AND A CARD INDEX

E. A. W.'s article, "Against Consolidation" was no argument against consolidation, necessarily, but more against its local administration. She admitted that last year the wagon came to her door. Personally, if I were victimized by the local officials in the way she is this year I would refuse to send my children to school, and any reasonable court would uphold her, and compel the officials to administer the affair with equal justice to all, or as nearly so as would be reasonable.

And do the children need to rise at 5.30 A. M. to be at the starting place at 7.30 in order to reach a school only three miles away at 9 A. M. or even at 8.45—which is the earliest hour of opening a school I know of?

They could walk the whole distance in less time than that. Let us be fair and reasonable, even in a matter of schools.

E. A. W. says nothing of the better conditions at the consolidated school, over the usual district school. We have lost sight of the value of education for its own sake and the right of a country child to the best educational opportunities. Blessings on E. A. W.'s three little men—and the way she continues to feel for

"Mary do you remember where I put that paper with the directions for making a self-feeder for hogs?"
"No, John, what paper was it in?"
"It was in the Pennsylvania Farmer."
"I told you to save it."
"All your Pennsylvania Farmers are in the pile of papers on top the bookcase."

If you, Gentle Reader, have ever been in John's predicament you will appreciate what a task he had finding that article.

Resolve now: "Never again!"

Provide yourself with a heavy blue pencil, or red if you prefer, and a card index case with a goodly supply of blank cards. Also a bottle of good paste and a—well I was going to say shears but maybe you can borrow a pair from your wife so you can save that much.

Sharpen that pencil, then after you have put on your favorite slippers and settled back in the easy chair with your copy of the Pennsylvania Farmer, left in the R. F. D. box this morn, as you read mark, plainly, all articles and there will be many, that you want to save for future reference.

You may postpone the clipping until later, after Mrs. Gentle Reader

Farm of B. H. Waite, Huntingdon County, Pa.

them. Some day they will appreciate what she is doing for them and will be a joy to her, if they can be made into broad-minded, educated citizens. Only do not get embittered by a little local injustice, but let her see to it that the very evident injustice is remedied. She seems to be the victim of the township system, which New York turned down a year ago, but which still has valuable features if rightly administered. Its weak features, like this one, can be and should be corrected. She admits the equality of taxes in her town. Without the township system one tax rate may be 16 mills and another 64 mills—an obvious miscarriage of justice as is true in this state now.

E. A. W. says the child farthest from school should have equal chances with those nearest. Right, and under either contracting or consolidation he can have it, as the wagon is movable and can go to each home. Can the district school house be moved from door to door or so located that it will be as near to one home as to another?

Let us exercise a spirit of farmers' and common sense—"Reader," New York.

Enthusiasm to a salesman is like gasoline to an automobile

Some Farm Hands Do the Work of Two—So Do Some Farm Tools

Once in a while you hire a man who's worth two or three ordinary men to you. If you've got that kind of a man this spring, hold on to him.

Farm implements perform in the same way. Two machines of different makes may cost about the same. But one fails you in an emergency, and the other performs beyond what you expect—does the work of two.

The E-B Line of farm machinery has proved its reliability during its 69 years of service. The experience of farmers everywhere backs up this reputation—whether with E-B horse-drawn or power-driven tools. The E-B dealer will give you reliable help in buying the right equipment for your needs. Then he'll give you the service that will keep that equipment in use 365 days in the year if necessary.

TALKS WITH THE BOYS

EDITOR'S LETTER

To the Boys:

I wish I were able to impress all boys with the fact that one of the big lessons of life is to learn to bear disappointment. I well remember that I thought when I was a boy that when I got to be a man I would be so independent that I could always have things as I wanted them and would not be heart-broken by disappointment so often. But I have not found it so. We never reach a point where we can always have things as we wish them. And it is a good thing, no doubt, that it is so. Long ago I learned a line of poetry which helped me greatly. It is: "Sometimes the thing our life misses, Helps more than the things which it gets."

Of course, we cannot see it that way at the time, but it makes us strong to choke back tears of anger at disappointment and try to bear our trials bravely.

One of the greatest of my boyhood disappointments occurred in this way: When I was about 13 years old I got enough money together to buy a setting of pure bred Plymouth Rock eggs. From these I raised ten fine chickens. Oh! how proud I was of them. I spent a great deal of time caring for them and built what I thought was a fine pen. No chickens ever had better attention. I shut them in every night, for mother had cautioned me never to forget that. But one night I did forget. When I went out to the pen in the morning I found that a weasel had killed all but one. I was all broken up. I have never since had a loss that hit me like that. And the worst of it was, I knew it was caused by that which causes most of our disappointments—my own carelessness or neglect.

Of course, I got over it quickly. That is one good thing about youthful disappointments—they soon disappear. But it was a dearly bought lesson not to forget. Boys, don't get the habit of saying, "I forgot."

Unless people learn to bear disappointment they become sour, crabbed and ill-natured. It is well early in life to adopt the motto, "If at first you don't succeed, try, try again." But sometimes it is better to give it up finally and try something else. There used to be an old popular song that had these lines in it:

"When things don't go to suit you,
And the world seems upside down;
Don't waste your time in fretting,
But drive away that frown.
Since life is oft perplexing,
It's much the wisest plan
To bear all trials bravely,
And smile when e'er you can."

Sincerely,
The Editor

LETTERS FROM THE BOYS

Dear Editor—I saw some letters written by boys published in the Pennsylvania Farmer and thought I would try to write one. My grandpa has taken the paper for a long time.

I am thirteen years old and am in seventh and eighth grade at school. I have missed only a few days of school this winter. I live in Wilnot township on a dairy farm of 251 acres and we have ten cows and three

horses. I like to trap and hunt. Last year I trapped and got two skunks—my brother got three. There are lots of fur-bearing animals in our country. We go to the creamery about five miles from our home. Last year I cultivated most of our corn and we had lots of fun filling our silo.—Glenwood N. Franklin, Bradford Co., Pa.

Dear Editor—Mother was reading to me some of the letters and articles of the Boy's Page of the Pennsylvania Farmer so I told Mother I was going to write to you.

I am thirteen years old and am in the sixth grade in a country school. Dad would like to farm, but does not own one. He works by the month and Mother tells him that if he would rent or work on shares he would make more money. There are five in our family with Dad and Mother.

Please answer this and tell me what is your opinion of it.—John Swartwood, Bradford Co., Pa.

Dear Editor—I have read in the Pennsylvania Farmer that you are having a page for the boys and am

Cecil Small, Millbrook Club Winner 2nd Prize 1919, \$25

very glad that the boys are to enjoy such a sport.

I am eleven years old and the only child of our family. I am in the Fourth Reader and have five other books. I have raised two hogs and a calf which I enjoyed very much. One of the pigs was given me by my Grandpa and after feeding it for about a year, I sold it for a good deal of money. It weighed 312 lbs. and was black in color. The other pig I bought from my Grandpa for 50 cents and fed it about six months and sold it the other week. It weighed 150 pounds. The calf I raised, sold for \$40. I have now a great deal of experience in raising stock.

My father has all my money in the bank and it is drawing interest which amounts to a good deal. I hope your page will be a great success.—Earl C. Deckard, Perry Co., Pa.

Dear Editor—I saw some letters in the Pennsylvania Farmer written by the boys, so I thought that I would write one too.

I live on a farm of 130 acres, but we farm only 100 acres cleared—the other 30 acres are woodland and pasture land. I have an older brother who went to school at Susquehanna for one year. He also helps on the farm.

In 1918 my father gave me a calf in the movies.

to raise and I sold it for \$50, with which I bought a Liberty Bond. I am 13 years old and have a mile to go to school. I am in the eighth grade and like my teacher very well.—John C. Gates, Huntingdon Co., Pa.

Dear Editor—My father is a subscriber of the Pennsylvania Farmer and I saw that you have a Boys' Page and thought I would write you a letter.

We live in the country and father owns a span of sorrel mules and a pair of big gray horses. I ride them to water and I drive the horses in the wagon to help father haul in corn in the fall. We had about 18 or 19 young pigs and father sold them all except one which he gave to me. I go to school which is about one mile away from my home and walk the whole way. I missed only two days. I like my teacher very much. I have a little brother who is not quite two years old.—J. Leroy Shult, Perry Co., Pa.

NEW JERSEY BOYS WIN CUP

By winning the eastern intercollegiate fruit-judging championship at Morgantown, West Va., January 20, the fruit judging team of the New Jersey State Agricultural College at New Brunswick now have permanent possession of the large silver trophy. The cup was offered first in January,

1915, by the West Virginia Horticultural Society to be awarded to the college first winning three contests.

The percentage of the winning team was 91.33, West Virginia was second with 88.3, Ohio State University third with 86.03, Penn State fourth with 85.6, and Maryland University fifth with 80.14.

The New Jersey team was composed of Ernest V. Close, Lawrenceville, Pa.; Robert E. Crane, of Montclair, N. J., and Charles A. Doehliert, of Rutherford, N. J. Highest individual honors in the contest were won by Ernest V. Close, of the New Jersey team with a score of 92.5. That the team was uniformly strong is shown by the fact that all three men had scores over 90.

"The best and most hopeful feature in any people is undoubtedly the instinct that leads them to the country to take root there, and not that which sends them flocking to the town with its distractions. The lighter the snow, the more it drifts; and the more frivolous the people, the more they are blown, by one wind or another into towns and cities."—John Burroughs.

Children are seen and not heard—

PASSING EVENTS IN PICTURES

1—New Justices sit in Supreme Court. Left to right: Sylvester B. Sadler, Chief Justice Robert Von Maschizsker (said to be the youngest Supreme Court Judge), and William L. Schoffer.

Of Interest to Farm Women and Girls

How Much Are We Worth?

(The following instructive article is by Dr. Benjamin Andrews, head of Teachers' College, Columbia University, which institution has sent out to all parts of our country many people who have been giving valuable aid to families in solving their financial and other problems. Dr. Andrews is pre-eminently practical in the household economics requirements made of his teachers and pupils, and he keenly appreciates that a financial accounting method for the average family must needs be very simple and require a minimum of time. You will be interested, we are sure, in his suggestions on this subject.—The Editors.)

By Benjamin R. Andrews, Teachers' College.

Taking an annual inventory of one's property and one's debts is a first step toward mental financial sanity when high retail prices continue to drive people to financial desperation. Taking such an inventory is a simple matter, which a man and his wife can carry out in an evening's financial conference, that will yield facts by which they can make intelligent financial plans for the year ahead.

Even if they keep no records of expenditures and receipts (and most American families have not yet discovered that such records can be kept in a simple form that pays for the trouble a dozen times over), it is possible to make the annual inventory of property and debts by writing down what they have and what they owe. Do you know how to properly estimate the value of all that you have? A simple schedule form is suggested herewith that will perhaps help you. It requires that you examine your bank balance and any other money on hand, and set a value on other property, such as government bonds, etc., real estate, livestock, feed for the stock and food for

your family, crops on hand, etc., farm furnishings, and thus get a total of your property. Then in a similar way, you jot down whatever outstanding debts there may be at stores or elsewhere, and such more or less permanent debts as mortgages, notes, etc., if there are any.

The total of the debts is then subtracted from the total of your property value, to get the worth of your property. This figure of net worth, or as the business man calls it, the net capital, is one of the goals sought by the most elaborate systems of bookkeeping. Yet the individual man or woman or householder can easily reach this figure regarding personal or family finance without keeping books.

The beauty of this simple device is that if one will take such an inventory at a given date each year, say about this time, which is a good time for a farmer's family because crops and stock are largely marketed by now, one can rather accurately look back to the conditions of a year ago and tell how much financial progress has been made during the year. By making such a memorandum now of your net worth at present you will have an interesting figure to check against a similar inventory figure to be taken next year at this time, and it will show you just how much you have saved during 1921. Keep these records in a book reserved for this purpose. You will find it an interesting and profitable experience.

A thick layer of newspapers between the springs and mattress of the outdoor bed will keep out cold.

If the pan for poached eggs is thoroughly oiled before the boiling water is poured into it, the eggs will not stick.

ATTRACTIVE LOOKING FOOD

In my school teaching days I always felt sorry for the children whose mothers put up unattractive food. Children are keenly sensitive or inordinately proud, according as their mothers dress and provide for them. Common sense and the desire to make them happy and at ease away from home will make the children think they have the best parents in the world, but on the other hand parents can make their boys and girls perfectly miserable by the way they neglect to give attention to the little details that mean so much to children.

The other day I saw two lunches put up for a small box supper and the contrast between them can hardly be imagined. The one had dainty sandwiches wrapped in waxed paper, two cookies also wrapped in waxed paper, an egg shelled and sprinkled in salt, an orange with the peel loosened, six or eight nuts cracked and wrapped in paper, three or four pieces of home made fudge wrapped, a small pickle and a bit of cheese with a folded paper napkin over all in a perfectly clean shoe box. The other lunch had chicken, frosted cake, pickles, sandwiches and eggs, but nothing was wrapped, everything was crumbly, the box was soiled on the outside and the egg, which was not peeled, was dirty and cracked. The unattractive box had more food and probably it was of just as good quality, but one box was well arranged and the other looked as if the food had been thrown together.

But not only in lunches does it pay to have things nice, but day in and day out at the table. A young girl once helped me in an emergency and she invariably broke the pieces of pie in putting them on the plates, turned the pudding upside down instead of keeping the delicious looking brown crust on top, served the mashed potatoes in a soup plate or on a dinner plate, mixed the cracked jelly glasses with the drinking glasses for the table, fried the meat to a crust on one side and left it raw looking on the other, mashed the potatoes and left them lumpy and dry looking, had big potatoes, sun burned potatoes and little potatoes in the same dish when they were served in their skins and generally threw things together in the cooking line. "What's the difference?" she would say. "Things taste just the same no matter if they look good or not." But they do not taste the same no matter how they are cooked and served. Attractive looking things are more economical and healthful from every standpoint.

A mother who complained that her children would eat no breakfast was amazed to find that it was because she expected them to have their food on the same plates, without washing, that the older folks had used earlier in the morning. She complained bitterly that her children were snippy, when in reality she probably would have had no appetite if she had been compelled to eat off a mussy plate.

One of the marks of good housekeeping is the ability to prepare and serve attractive things for the home folks and for social occasions. Every woman knows who sends delicious, attractive foods to the church suppers and socials, and every woman knows who sends the other kind. It is the delight of every good cook's heart to hear her food praised, and it is too bad that some ladies will not set themselves definitely to the task of making even toast and coffee look so attractive that an invalid will relish them.—Hilda Richmond.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3455.—Comfortable Coat for Child. Pattern is cut in 5 sizes: 6, 8, 10, 12 and 14 years. A 10-year size will require 3½ yards of 44-inch material. Cheviot, tweed, serge, broadcloth, velveteen, corduroy, heather mixtures, velours, duvetyne and taffeta could be used for this type. Pattern, 10 cents.

3432.—Frock for 'Growing Girl.' Pattern is cut in 4 sizes: 6, 8, 10 and 12 years. A 10-year size will require 3½ yards of 36-inch material. As here shown the dress is of plaid gingham with collar, belt and cuffs of white drill. One could have checked woolen, serge, velveteen, taffeta, gabardine or percale. Pattern, 10 cents.

3456.—Comfortable Work Dress.—Pattern is cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; 44-46 inches bust measure. A 38-inch size requires 4½ yards of 36-inch material. Gingham, seersucker, chambray, lawn, sateen, alpaca, drill and linen could be used for this design. Pattern, 10 cents.

3432.—A Smart Dress.—Pattern is cut in 3 sizes: 16, 18 and 20 years. A 16-year size will require 3½ yards of 44-inch material. Satin, taffeta, duvetyne, broadcloth, velveteen, linen and tricotline are attractive for this model. The width of the skirt at lower edge is about 2 yards.

A pattern of this illustration mailed to any address on receipt of 10 cents in silver or stamps.

CATALOGUE NOTICE

Send 15c in silver or stamps for our up-to-date Spring and Summer 1921 Catalogue, containing over 500 designs of ladies', misses and children's patterns, a concise and comprehensive article on Dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker.

This Style Book is Yours—Free!

There is a Saving this Spring of \$50. for You on Your Family's Needs

The "NATIONAL" Policy Always to Please the Customer

Your Money Back if You Want It

THE "NATIONAL" Money-Saving Style Book

NATIONAL CLOAK & SUIT CO.

OUT of the "NATIONAL" Style Book steps the woman made beautiful by Fashion. From Fifth Avenue Hat, to "NATIONAL" Dress, and Coat or Suit, even to the Shoes, there is the beauty and charm called Style. And, best of all, that Woman of Style may just as well be you.

Your "NATIONAL" Style Book—and one copy IS YOURS free—shows everything needed to bring to you all that style can give.

For men who believe that appearance is desirable and service essential, there are suits and overcoats and shirts and shoes—everything of quality for men.

For young Misses of fashion, there are dresses and coats and hats with the charm of youth. For young men and boys, everything in clothes of quality. For the whole family, everything of the best New York Style. But there is more—far more.

the south's newest great railway.

A 10-acre orange or grapefruit grove in Florida means independence for life. Well cared for trees remain profitable for 30 to 50 years and \$500 per acre is an average return, though one grapefruit grove has netted its owners \$2500 per acre. Productive land sells for \$35 to \$50 per acre. When cleared and planted with oranges or grapefruit it brings from \$300 to \$1000 per acre. No excessive heat in summer—no cold in winter—splendid roads, churches and schools.

The Carolina Fruit Hills

In the beautiful Carolina Fruit Hills—in the heart of the pines—wonderful peaches and berries are grown that net the farmer profits of \$500 to \$1000 per acre.

Write for our interesting and instructive book entitled, "Orange, Grapefruit and Vegetable Growing in the Land of Manatee," or for a copy of "The Carolina Fruit Hills," which shows the big profits made in North and South Carolina on peaches and small fruits.

A Story for Children

The Mouse's Fright

Mr. Mouse and the Farmerette are Both Scared

MR. AND MRS. MOUSE had two homes—one in the country and one in town. Their town home was Mr. Green's big, roomy barn and during the cold winter, they kept very warm in their cozy little house under the hay loft. It was very easy to find lots to eat, for right near them were bins of corn and all sorts of other grain. Sometimes they were successful in stealing the cheese out of traps without putting them off.

But when summer came, the Mouse family left the indoors, for they loved their country home with the wide green fields for their children to play in. All day long, they would romp among the haystacks in the neighboring fields and play hide-and-seek with other families of mice.

It was summer now, and Mr. and Mrs. Mouse had come to the country once more. But this summer, they had not gone back to the same place, but had a brand new home near the center of the field. Here, they thought, no one would ever disturb them. However, one day when Mrs. Mouse was hanging up some curtains she heard a thud! thud! thud! right above her head and she was so frightened that she fell off of the chair and bumped her nose.

"What's the matter?" called her husband, running in.

"Oh! my dear, I've had such a fright," she panted. "Some one is knocking our roof in. Listen!"

Again the thud was heard, this time accompanied by a little scratching sound.

"It is only someone digging," he said calmly, but his nervous glance at the ceiling showed he was not so calm. And, no wonder, for it would not be very pleasant to have the roof come tumbling in on their heads.

"I am going to see what it is," he announced bravely, and walked to the door.

He went out cautiously and stood up to look around, but right above him there was such a terrible noise that he almost froze with terror. When he got his senses again, he went into the house shaking with fright.

At that moment, his uncle from town came in laughing so hard that his sides shook.

"Ha! ha! ha! That's the funniest thing I've seen for a long time," he managed to say.

When he could control himself, he explained.

"I heard Farmer Green's daughter say she was going to hoe corn. She started toward your house so I followed to see what would happen, and I saw—ha! ha! ha! When she saw you come out she was so frightened that he screamed and ran away as fast as she could, scaring you just as much by her scream. Anyhow, I don't believe you'll be bothered again by her."—L. M. K.

When Mother Smiles

When Mother smiles
It may not mean she's happy,
For Mother smiles oftentimes
Although she's sad—
And sings a little song
To help the heartache
And make the world think—maybe—
That she's glad.

Sometimes she smiles
A smile of tender patience;
Though cares pile heavy
And the road is rough,
Can she but find the strength
To help her dear ones
And smile away their troubles—
That's enough.

One reason why some people accomplish more results than others is because they attempt more.

Advertising is the flywheel of business. When it stops, business is at a standstill.

But when she smiles
That smile of radiant gladness
For cares and labors put
Away awhile,
When tired hands are freed
From dreary toiling,
The whole, round world is richer
For her smile.

Let Mother smile
The smile of gladness always;
She's had enough of smiling
Thru her tears.
Let's coax the smile by lifting
Mother's burdens
And keep it radiant, shining,
Thru the years.

—F. J. St. John.

A city can get along without some men but it can't get ahead without them.

Any job well done is a good advertisement for the man or company that did it.

Use Dandelion Butter Color

Add a half-teaspoonful to each gallon of winter cream and out of your churn comes butter of golden June shade to bring you top prices.

DANDELION Butter Color

All stores sell 35-cent bottles, each sufficient to keep that rich, "Golden Shade" in your butter all the year round. Standard Butter Color for fifty years. Purely vegetable. Meets all food laws, State and National. Used by all large creameries. Will not color the buttermilk. Tasteless.

The "U. S." Bootee

Why every farmer needs a pair

The all-round rubber shoes that are strong and comfortable

YOU know how quickly leather shoes get water-soaked and caked with mud around the farm.

Here's a handy rubber shoe that's as watertight and easily cleaned as a rubber boot. First designed for miners, who must have a waterproof shoe that will not tire their feet, the U. S. Bootee was made to withstand the roughest wear—absolutely watertight—and yet light and comfortable.

It fits as smoothly over your sock as a leather shoe—you're sure of solid comfort all the time. And even in five or six inches of water, it keeps your feet absolutely dry.

Ask your dealer to show you a pair of U. S. Bootees. Note their waterproof, smooth rubber surface—feel how pliable and comfortable they are—

examine for yourself their wonderful built-to-wear construction.

Other types of "U. S." Footwear—built for rough service

U. S. Boots have all the wear and comfort which the accumulated improvements of 74 years have given them.

U. S. Walrus combine the warmth and convenience of a cloth-top arctic with the protection of a rubber boot. They slip right on over your leather shoes, and you can wash them clean instantly while they're still on your feet.

The U. S. line of footwear has a type for every need—arctics, rubbers, "overs." Every one is backed by over a half a century of experience. The rubber comes from our own plantations—the whole process of manufacture is supervised by experts.

Always look for the U. S. Seal—it means solid wear and long service for your money.

MEN WHO SERVE YOU

Dr. Henry C. Taylor, Chief of the Office of Farm Management, United States Department of Agriculture, has spent his whole life in work which has been valuable in preparing him for his present position. He prepared himself for college, going directly from the country schools to Drake University, later studying farm economics and getting his degree of Ph. D. at the University of Wisconsin. Dr. Taylor came in close touch with farmers' problems during his

Dr. Henry C. Taylor,
Bureau of Farm Management

eight years' of experience running a farm for himself. In his work as Chief of the Office of Farm Management he tries to help the farmer to a better living. He believes that the farmers of the country should have more leisure and he aims to help them get it by finding and making known better methods of doing farm work. One of the notable achievements of Dr. Taylor has been his invention of a system of farm book-keeping which, while simple and easily adaptable to various conditions, serves the purpose as well as the more complicated systems.

GOOD ROADS AND THE MOTOR TRUCK

The strength of a chain is that of its weakest link. The value of an improved road is measured by the traffic that can be moved over it. If for any reason a section of road surface breaks down, the service given by the road is reduced to the capacity of the damaged section. To make the road an efficient means for transportation it must be properly constructed and kept in good condition over its entire length. A road that is partly good and partly damaged is like the curate's egg: "very good—in parts."

Aspirin

Then It's Genuine

T. B. WEST, MAPLE BEND NURSERY, PERRY, OHIO

er owners of motor trucks. Of these farmers 59 per cent stated that poor roads were a great disadvantage in the use of a motor truck, and 45 per cent gave bad roads as the reason for still using horses for part of their road hauling. As the farmers reporting were all located in 11 northeastern states, where the roads are much better than in the rest of the country, it is evident that road conditions in the other states must be a still greater obstacle to the profitable use of the motor truck.

In many sections of the country it has been found that what are called "improved" roads have broken down under the operation of motor trucks, and the lack of definite knowledge as to the wearing effect on the road of different sizes of truck has in some states led to the enactment of laws prohibiting the operation of the large capacity trucks, on the theory that this class of truck causes most of the road damage. This action has been based wholly upon the assumption that it is the gross weight of the truck that determines the impact, or wearing pressure on the road, a conclusion reached without any scientific investigation, or exact knowledge.

In view of the close relation of the problem of road damage to the question of better transportation facilities for the rural districts, the U. S. Bureau of Public Roads undertook this year to make a thorough study of the wearing effect on the road of trucks of different capacities, with varying tire equipment and differences of "unsprung" weight (weight not sustained by springs), running at varying rates of speed. The full report on these tests has not yet been published, but the preliminary report shows clearly that the impact of the moving truck is no determined by its gross weight, but that unsprung weight, tire equipment, overloading beyond rated capacity, and found that a 3-ton truck with a load speed of operation, are the important factors. In one series of tests it was of 5 tons running at a speed of 15 miles per hour over a 2-inch rut, had an impact of 17 tons.

A 51-ton truck with load of 51 tons, so designed as to have a relatively light unsprung weight, under the same conditions had an impact of only 12 tons.

These tests also showed that the speed at which the truck is operated affects the impact, which increases with increased speed of the truck. As the smaller trucks run at a higher than that of the slower moving their impact must be relatively greater than that of the slower-moving large truck.

These facts of official record effectively dispose of the claim that the large truck is responsible for most of the road damage, and should prevent the further enactment of restrictive laws based upon load capacity. With the theory of gross-weight injury disproved, there is not the slightest excuse for discrimination against the larger trucks.

There remains the important question of road construction to meet the requirements of the new transport agency. It will generally be found that the failure of an "improved" road to withstand motor truck traffic is due to some defect in design or construction, such as lack of drainage, insufficient foundations, or inferior materials, or to the action of frost in weakening the road. Highway engineering has been developed in recent years into an almost exact science, and it is now possible to design and build roads that will

FARMS AND HOMES in Delaware where the climate is pleasant, the lands productive and prices reasonable. For information write State Board of Agriculture, Dover, Delaware

carry safely any traffic that they may be called upon to bear. These roads cost more to build in the first instance, but their far greater durability, and much lower cost of maintenance, make them the cheapest road in the long run. With roads properly designed and constructed the use of the motor truck can be extended to every section of the rural districts where there is freight to be moved, to the great advantage, not only of the farmer, but of the great consuming public that will be benefited by cheaper transportation of the products of our farms.

HAVE YOU ANY BIG TREES?

The Pennsylvania Department of Forestry has begun a campaign to locate the big trees of Pennsylvania. It is collecting information on the largest specimen of each kind of the 100 different species of forest trees that grow in the state. Col. Henry W. Shoemaker, a member of the State Forest Commission, and Professor Joseph S. Illick, chief of the Office of Research, are in charge of the project.

Professor Illick said he is seeking information about large, unique and historic trees. He believes each county of the state has some champion tree, and he wants to know about it.

Bedford County boasts of the largest swamp white oak yet found in Pennsylvania. That tree is thirty-two feet in circumference at the base. Dauphin County claims the largest Sycamore, which is more than twenty-five feet in circumference at the base. It is declared that the state's largest sugar maple stand sat Eaglesmere, Sullivan County.

Professor Illick desires the following measurements of big trees; circumference at breast-height; total height of tree, and the total spread of branches.

POTATO WART UNDER CONTROL

In the war against potato wart the United States has done in less than two years what other countries had not succeeded in doing in decades. Wart has been for a long time a destructive disease of potatoes in Europe, and the belief always was that once a garden or field became infected there was no way of eradicating it. An infected area, even when no potatoes were planted in it for a number of years, would show the disease still virulent when again planted to potatoes. The potato wart disease was discovered last year in gardens in some small mining towns in Pennsylvania. The United States Department of Agriculture quarantined the infected areas and the specialists of the department began experiments in control. They have now announced that a field or garden infected with potato wart can be thoroughly disinfected by the use of steam and formaldehyde. The cost of the work, however, is high, and it will be used only when absolutely necessary in cleaning up the infected areas.

The investigators of the department, who have worked in co-operation with the state authorities of Pennsylvania and West Virginia, have also discovered varieties of potato that are immune to the wart disease, and steps are being taken to assist gardeners in the infected regions to purchase varieties of seed known to be immune. The department specialists now believe that further losses from the disease can be practically eliminated.

Syracuse Harrow Works Your Land • for Bigger Crops •

THE only safe way to cut the cost of producing crops, per bushel or per ton, is to increase the yield per acre. Better seed beds are necessary for this increased yield—the kind of seed beds insured by the use of the

JOHN DEERE SYRACUSE SPRING TOOTH HARROW

The teeth on this harrow are designed for proper penetration. You can force them into the ground to any depth desired. They stir and mix the soil thoroughly, and leave it finely pulverized. In this condition the soil warms quickly, insuring rapid seed germination and steady plant growth.

The frame and tooth bars on Syracuse Harrows are made of high quality steel, strong and elastic. The teeth themselves are of high carbon steel, with no bolt holes to weaken them. The

teeth are clipped to the tooth bars, allowing adjustment for wear. Any number of sections can be combined, and a special hitch adapts this tool to tractor use.

Your John Deere dealer has a supply of Syracuse Spring Tooth Harrows on hand. Be sure to see them. Write us for a folder, and for Better Farm Implements. Throughout its 114 pages are illustrations and descriptions of the full line of John Deere tools. It's free for the asking. Address John Deere, Moline, Illinois, and ask for Package SH-836

Beechwood

THE QUAKERTOWN STOVE WORKS
Quakertown, Pa.

THE housewife who towns a Beechwood range puts confidence in it. She knows that it will give the good results expected of it.

She knows too, that it has added much to the beauty of her kitchen. This beautiful enameled range will not chip, craze, or crack. Heat will not discolor it. And it cleans easily. All that is needed is a damp cloth. An oiled cloth cleans the polished top.

Choice of three colors—blue, gray and brown. Write for folder.

THE VOICE OF THE PACK

(Continued From Page 20).

ter were more afraid of human beings than any other living creature. It wasn't a lynx—one of those curiosity-devoured little felines that will mew all day on a trail and never dare come near. It was much too large for a lynx. The feet felt too solidly. She had already given up the idea that it could be Wolf. There were no dogs in the mountains to follow at heel; and she had no desire whatever to meet Shag, the faithful hybrid that used to be her guardian in the hills. For Shag had gone to his well-deserved rest several seasons before. Two other possibilities remained. One was that this follower was a human being, the other that it was a cougar.

Ordinarily a human being is much more potentially dangerous to woman in the hills at night than a cougar. A cougar is an abject coward and some men are not. But Snowbird felt herself entirely capable of handling any human foe. They would have no advantage over her; they would have no purpose in killing from ambush; and she trusted to her own marksmanship implicitly. While it is an extremely difficult thing to shoot at a cougar leaping from the thicket, a tall man standing on a trail presents an easy target. Besides, she had a vague sense of discomfort that if this animal were a cougar, he was not acting true to form. He was altogether too bold.

She knew perfectly that many times since men came to live in the pine-clad mountains they have been followed by the great, tawny cats. Curiosity had something to do with it, and perhaps less pleasing reasons. But any dreadful instincts that such a cat may have, he utterly lacks courage to obey. He has an inborn fear of men, a fear that goes down to the roots of the world, and he simply doesn't dare make an attack. It was always a rather distressing experience, but nothing ever came of it except a good tale around a fireside. But most of these episodes, Snowbird remembered, occurred either in daylight or in the dry season. The reason was obviously that in the damp woods or at night a stalking cougar cannot be perceived by human senses. Her own senses could perceive this animal all too plainly—and the fact suggested unpleasant possibilities.

The animal on the trail behind her was taking no care at all to go silently. He was simply pat-patting along, wholly at his ease. He acted as if the fear that men have instilled in his breed was somehow missing. And that is why she instinctively tried to hurry on the trail.

The step kept pace. For a long mile, up a barren ridge, she heard every step it made. Then, as the brush closed deeper around her, she couldn't hear it at all.

She hurried on, straining to the silence. No, the sound was stopped. Could it be that the animal, fearful at last, had turned from her trail? And then for the first time a gasp that was not greatly different from a despairing sob caught at her throat. She heard the steps again, and they were in the thickets just beside her.

Two hours before Snowbird had left the house, on her long tramp to the ranger station, Dan had started home. He hadn't shot until sunset, as he had planned. The rear guard of the water-fowl—hardy birds who spent most of the winter in the lake region and which had come

south in the great flight that had been completed some weeks before—had passed in hundreds over his blind, and he had obtained the limit he had set upon himself—ten drake mallards—by four o'clock in the afternoon. If he stayed to shoot longer, his birds would have been wasted. So he started back along a certain winding trail that led thru the thickets and which would, if followed long enough carry him to the road that led to the valleys.

He rode one of Lennox's cattle ponies, the only piece of horse-flesh that Bill had not taken to the valleys when he had driven down the live stock. She was a pretty bay, a spirited, high-bred mare that could whip about on her hind legs at the touch of the rein on her neck. She made good time along the trail. And an hour before sunset he passed the only human habitation between the marsh and Lennox's house—the cabin that had been recently occupied by Landy Hildreth.

He glanced at the place as he passed and saw that it was deserted. No smell of wood smoke remained in the air. Evidently Landy had gone down to the settlements with his precious testimony in regard to the arson ring. Yet it was curious that no word had been heard of him. As far as Dan knew, neither the courts nor the forest service had taken action.

He hurried on, four miles farther. The trail entered the heavy thickets, and he had to ride slowly. It was as wild a section as could be found on the whole Divide. Once a deer leaped from the trail, and once he heard Wolf grunting in the thickets. And just as he came to a little cleared space, three strange, dark birds flung up on wide-spreading wings.

He knew them at once. All mountaineers come to know them before their days are done. They were buzzards, the followers of the dead, and what they were doing in the thicket just beside the trail, Dan did not dare to think.

Of course they might be feeding on the body of a deer, mortally wounded by some hunter. He resolved to ride by without investigating. He glanced up. The buzzards were hovering in the sky, evidently waiting for him to pass. Then, mostly to relieve a curious sense of discomfort in his own mind, he stopped his horse and dismounted.

The twilight had started to fall, and already its first grayness had begun to soften the harder lines of forest and hill. And after his first glance at the curious white heap beside the trail, he was extremely glad that he had. But there was no chance to mistake the thing. The elements and much more terrible agents had each wrought their change, yet there was grisly evidence in plenty to show what had occurred. Dan didn't doubt for an instant but that it was the skeleton of Landy Hildreth.

He forced himself to go nearer. The buzzards were almost done, and one white bone from the shoulder gave unmistakable evidence of the passage of a bullet. What had happened thereafter, he could only guess.

He got back quickly on his horse. He understood now, why nothing had been heard of the evidence that Landy Hildreth was to turn over to the courts as to the activities of the arson ring. Some one—probably Bert Cranston himself—had been waiting on the trail. Others had come thereafter. And his lips set in his resolve to let this murder measure in the debt he had to pay Cranston.

(Continued Next Week).

HATCHING AND RAISING DUCKS

To hatch little ducks successfully the nests should be made on the ground, or an upturned piece of sod should be put in the nesting box. To start them the first two weeks they should be fed principally on rolled oats and curd made by scalding thick sour milk. The curd should be allowed to cool before feeding, as the ducks enjoy it more. If they can be gotten past the first two weeks, there is not much danger of losing them.

I lost very few of mine by starting them on rolled oats and curd. Rolled oats being light in weight, makes an inexpensive feed. Little ducks and peeps are both very fond of it.

They should have plenty of water to drink, but shouldn't be allowed to get themselves wet until they are about three weeks old. A drinking fountain is necessary for this purpose.

Anna E. Ryder and Her Ducks

ness. A little duck will drown quicker than a peep, if caught in the rain. I raised forty-one last year.

There is a good demand for duck eggs for setting and for ducks at Thanksgiving and Christmas.—Anna E. Ryder, Franklin Co., Pa.

LIMBERNECK

I am writing to see if you can tell me what is the matter with my purebred brown leghorn pullet. She has been sick for two days. The symptoms are: she sits on roost or floor and eats very little. She acts as if she had no control of her neck as her head keeps tipping backwards. She is a young hen and I would like to cure her.—C. B., Delaware Co., New York.

A loss of control of the neck muscles is usually due to limberneck caused by eating some form of decayed animal matter. Gum asafetida has been found to cure this trouble. Give a piece about the size of two peas every three hours until three doses have been given. Then wait about half a day and see if the sick bird begins to return to normal. Two or more doses about three hours apart are recommended if the hen does not begin to improve after the first series of treatments.

In cases of this kind treatment should start as soon as possible after the condition is discovered as the bird may weaken rapidly. Prevention is the best cure and consists in keeping the range free of all dead animals. Sometimes dogs will dig up or

bring home dead carcasses and place the material in the poultry yards or on the range.

HENS WITH BRONCHITIS

I have a flock of Leghorn hens which has been laying regularly this winter but in the last few days several of them have died. The hens are taken sick suddenly and die before I can do anything for them. They open their beaks and gasp for breath and in a little while choke to death. I have tried everything for them but altho a few have gotten better the most of them do not last long. I have them in a well-lighted coop and they get lots of fresh air.—S. L., Lycoming County.

Hens with bronchitis show the symptoms you have indicated. Add 6 or eight drops of turpentine to a tablespoonful of castor oil and give that dose to each sick bird. Some cases will respond readily to treatment and others are difficult to cure. Isolate the sick birds in a clean place

Profitable "Farm Help"

THE proper use of Dempwolf's Fertilizers will pay you better in crop returns than the work of "all the King's horses and all the King's men." No amount of work will make up for lack of fertility in your soil.

On the other hand, the right brand of Dempwolf's Fertilizers will be the most profitable farm "help" you can get. It will meet the needs of the crop you want to grow and also replace some of the plant food used by the crop you grew last year.

It is good farming judgment to see that your crops are fed as well as cultivated. Both are necessary to give you the best returns for your labor.

For 50 years we have been furnishing Dempwolf's Fertilizers to many of the most successful farmers of this section. Year after year, they have profited by our experience, as we have also profited by theirs. We have come to know fertilizer as you know your farm, and all that we know about making good crops by making good fertilizer is at the service of our customers.

Write us for information that will enable you to get exactly the right fertilizer for your needs.

CLOVER

AT SACRIFICED PRICES
BUYERS CAN SAVE BIG MONEY NOW

Big clover growers of the middle west came to us and made big orders to move their crops. They needed cash. We had the money to take their orders. This means lower prices to you because this fine lot of clover will not be loaded for higher prices, but passed on at a legitimate profit to early buyers. Big volume on a small profit to you. Every bag is high testing, guaranteed seed sold on an absolutely money back guarantee. This lot will save you money. Write for samples and big seed guide—all true.—American Mutual Seed Co. Dept. 430 Chicago, Ill.

No Buckles

First—Build on Paper

The man who builds cheaply is he who plans well before building. What a barn costs depends in no small degree on the care with which it is planned on paper in advance. Any mistakes made in building can be corrected only at great expense; and if not corrected may cost you good money, through making unnecessary work every day, so long as the barn is used.

Mistakes made on paper are easily righted without expense and buildings on paper are readily moved.

Get your plans down on paper. Take plenty of time to study carefully; discuss it with others. Make it the ideal barn for your particular purposes.

Be sure you have the right amount of storage, enough light, air space and ventilation; work-saving arrangement for feeding, watering the stock and cleaning the stable; easy handling of the hay; and right location of the barn for sunshine and cold winds.

Make certain that the barn is correctly proportioned, is individual in appearance, a barn that is strong enough to withstand all storms—one that will add value to your farm.

Jamesway Barn Plan Service

You can have all this without extra cost.

The man who has plans completely worked out and blue printed, can submit them to several contractors, accepting in safety the lowest bid because all are bidding on exactly the same proposition.

Contractors and those supplying materials are held to exact requirements; substitution of inferior materials or workmanship is prevented; wastes and expensive "extras" are avoided; misunderstandings are unlikely.

In the Jamesway organization are scores of Barn Planning Experts, whose experience and help are yours for the asking.

For years, these men have studied

dairy barns—construction, lighting, ventilation, drainage, arrangement to save labor; how best to remodel old barns. Every year they visit thousands of dairy barns in every section of the country; every year they help to plan thousands of barns.

The best of their ideas are in a 320-page book on barn building, remodeling, ventilation and equipment; this book will be sent free on request.

Write us now. Tell whether you expect to build or remodel this year; and say what barn problems are bothering you. Perhaps we can help you solve them. If you want the book, ask for "THE JAMESWAY BOOK No. 26."

FARM LABOR—A SOCIAL SURVEY

A Review of the Conditions Facing Farm Laborers in Pennsylvania and New Jersey

Introduction:

A small group of New Jersey and Pennsylvania farmers have for the past three years been holding several meetings in Philadelphia each winter to study the economic, educational, social and religious problems of country life. The chief object in view was to seek concrete methods of living out in a broader way, right on their own farms and in their own neighborhoods, that sense of brotherhood and that passion for service which is a well recognized Christian ideal, but which so many fear is not practical in a work-a-day world.

Because of its complexities and its all important position in our agricultural future, the farm labor problem claimed a large share of attention. In order to learn more definitely what was the actual status of this problem, it was felt that a survey would be necessary, and as a result, the co-operation of the Inter-Church World Movement was secured and one of their investigators, Max Watson, made a study of labor conditions on farms in Burlington and Camden Counties, New Jersey, and Chester and Delaware Counties, Pennsylvania.

The following article is an abbreviated report of this study. Every effort has been made to preserve the spirit and thought of the author and where the group widely disagreed, there is a foot-note. These farmers felt that the high points in the report are:

- (1) Steady employment with opportunity for advancement.
- (2) Comfortable housing conditions and home-like surroundings.
- (3) Some system of profit-sharing or bonuses to increase interest.
- (4) Opportunities for recreation and self-expression.

The last point is especially stressed, and it must be admitted there is need for wide development of social and recreational opportunities for the hired man and his family, thru properly organized community effort. The fundamental human instincts and wants which take country people from rural communities to the great cities must be recognized and satisfied.

This review is published in the thought that there are many farmers who have been

struggling with this problem and who need some encouragement to live out their ideals. The compelling motive behind any endeavor to improve labor or other conditions must ever be that of our Christian obligation to our fellows, but the effort pays, not only in dollars and cents, but also in terms of those more subtle, but even more real advantages such as better service, higher standards of living, and healthy surroundings for the growing generation. Our American farms in the past have preserved and forwarded the best American ideals. Can we make this record true for the present and the future?

Data was secured from both the individual

hired man living in a tenant house and from the farm owner. It was found that the system of the married farm hand living in the farm tenant house was almost universal. This discussion was therefore confined to the problem involving the tenant farm hand and also the temporary Italian harvest hands. The first part of the review follows and it will be continued in future issues.

It is necessary in analyzing the problem of farm labor and the tendency of the farm laborer to leave the farm for industry to get the point of view of the farm hand.

It is necessary also, to recognize that there are certain fundamental human traits which exist in every individual. One of the most important of these is personal ambition as expressed in the desire to accumulate wealth; another is the desire to do as little physical work as possible, for the amount of income secured.

Little Opportunity for Advancement

A man in entering any field of labor, considers what the possibilities are in the future and whether or not he can ultimately secure a position which will bring him a greater income and at the same time demand less physical labor. It is significant, therefore, to recognize that the position of the farm hand offers little chance of promotion. Continued service or experience does not gain him any material advancement in income nor lessen the physical difficulties of his task. It is true that in industry, a large percentage of unskilled laborers or semi-skilled laborers are not able to reach a position which pays more than a mere existence wage or eliminate the hard physical labor. However, there is always the possibility of promotion and advancement and there are always a few who succeed in getting better positions. With the farm hand, however, it must be recognized that the prospect of promotion or the possibility of accumulating sufficient capital to be anything but a farmhand, is very remote and certainly cannot be considered an incentive to a man seeking this field of labor. Such conditions certainly

Cleanliness and Good Equipment Are Necessary for Clean Milk

cannot be attractive to an ambitious young man who hopes eventually to attain a position which may afford some of the luxuries of life and easier work. If the farm is to hold the ambitious young man, it must make it possible for him to see a line of promotion which will lead to more than what he can now find on the farm as a tenant hand. (Note 1). What ultimately becomes of farm tenant hands, who grow old without being able to accumulate anything for their last years, is a serious problem. Certainly a life of service should carry with it some possible assurance of the future.

Tenant Houses

It was found that the size of the tenant hand's family exceeded that of the family of the average unskilled laborer in the city by almost two persons. A number of cases were found where from eight to ten children under a working age were living at home. In all cases where there were families of over six children the question of mere food was a serious problem and every penny had to be counted in order to furnish the bare necessities of life. A farmer who employs a man with a large family and expects to keep him certainly should see that the man and his family are comfortably housed and that their living conditions are such that they may expect efficient work from the farmhand. A man living in a house which is full of vermin, poorly protected from the weather, or poorly heated cannot be expected to furnish a good day's work. Neither is it possible for a man who finds it necessary for his children to sleep on the floor or to go

without proper nourishment, to maintain a frame of mind which can make him efficient. The farmer should know what the living conditions of his tenants are, and do everything within his power and sound business reason to see that they are made comfortable. This need not be in any way a social obligation, but purely one of efficient business management. The tenant house must be considered from the point of view of the man and also from the point of view of the woman. The average tenant house can be described as a two-story, five or six-room frame dwelling, heated by a stove in the kitchen and a stove in the living room, the bedrooms being entirely unheated. The water supply is usually a pump located in a shed by the kitchen door or inside of the kitchen. The lighting is furnished by kerosene lamps. The toilet is an outhouse located from 75 to 100 feet from the house. This means that the average tenant house has none of the modern improvements of the last fifty years. Generally speaking, no attempt is made in constructing a tenant house to give it any architectural beauty. The design is severe and ugly in the extreme and there is nothing about its appearance which could be considered attractive. Its function is quite evidently to furnish a roof and rooms in which to eat and sleep. When it is considered that the house in which a family lives is the most concrete evidence of their social status and especially, in the mind of the child and mother, forms the greatest part of their immediate world, its importance cannot be over-estimated. Every farmer will admit that fifty per cent of the unrest of farm labor is due to the women. Un-

less the woman can have a house in which she can take a certain amount of pride and which she can feel is a suitable dwelling in which to live and rear her children, it is impossible for her to be satisfied. A farmer often expresses the idea that his farm help would not keep up a good house if they had one. This argument is fallacious from two points of view. First of all there is small incentive in trying to keep up a poor house, and secondly, if better houses were furnished it would be possible to secure the type of farmhands who would take sufficient interest to take proper care of the house. This better type of farm-hand will refuse to live in the average tenant house.

There is no more reason to have a poor and old-fashioned tenant house than there would be for a modern farmer to have an old, wornout traction engine with which to do his plowing. If the farmer would realize to what extent industrial investigation has proven the importance of home conditions, assuring the workman pleasant surroundings and a good night's rest and a contented family, he would not hesitate in bettering housing conditions from a standpoint of pure business efficiency. A tenant house can be built with very little additional expense and still be made home-like in appearance.

Note 1—It is felt that this statement regarding promotion is too severe, as it leaves out of consideration the thousands of farm hands who have become prosperous share farmers, renters and farm owners.

(Continued Next Week.)

National Tractor Show Great Event

By Far The Best Collection Of Power Farming Machinery Ever Assembled

The Sixth Annual National Tractor Show held in Columbus last week was without a doubt the most complete exhibition of power farming machinery ever held in this country. It not only reviewed the rapid progress that has been made in applying mechanical power to farm operations but it forcibly drew attention to the wonderful possibilities that gasoline and kerosene can bring to the American farmer. No one who inspected the eight large exhibition buildings, the permanent home of the Ohio State Fair, devoted exclusively to power farming machinery can help but visualize what farming will be in the future.

An Educational Exhibit

The idea back of the show was not to sell tractors. Power farming is broader than that. It includes the use of the truck for hauling purposes; the use of the tractor in soil preparation, planting, harvesting and other farm operations; the use of the motor cultivator in planting and cultivating rowed crops; the use of stationary engines in lighting, pumping water, milking and other services that liquid fuel can perform to make the burdens of the farmer lighter, to enable him to cut down production costs, to make life on the farm more enjoyable.

Manufacturers spared no expense in ably presenting the power farming idea. There was no admission fee, the only requirement being the securing of a pass by registration. The large dining hall on the grounds was open the entire week and lunch stands were located in each building. Everything possible for the comfort and convenience of visitors was provided. Covered passageways between the buildings and mammoth heating plants in each building protected visitors from cold and rain.

Education and service was a slogan back of each exhibit. How it worked, how to take care of it, how to operate it—in other words, service and education was the aim of every exhibitor. Detailed information of every kind was available, the intention being to show why power farming is a practicable thing, not only to the dealer but to the farmer.

In addition to the educational features found in each exhibit, a regular program on tractors and their operation was arranged by the management. Motion pictures on power farming were popular. The lectures on power farming, adapting the farm to power, determining types and size of tractors to buy, the trend of tractor design, ignition trouble, tractor hitches, lessons

from a tractor survey, the tractor and belt power, tractor service, tractor tools, community purchase of tractors, housing the tractors, by such prominent agricultural engineers as Olney, Dickerson, Davidson, Sjogren, Scoates, Blasingame, Aitkenhead, Duffee, Ives and McCuen and finally a frank discussion by four real farmers on what the tractor did for them rounded out the educational program. These men must be congratulated on the able way they handled their subjects and the interest which developed at these lectures indicated that their efforts were well worth while. The educational exhibit of the American Society of Agricultural Engineers was a worthy one—largely a compilation of data on power farming by the agricultural engineering departments of the state universities. The Society of Automotive Engineers also made the show an occasion for meeting and program on power farming.

Great Improvement Shown

The show was marked by great advances in the construction of implements and machinery, which are drawn and operated by tractor power. Simplicity of operation, control from the seat, better materials and a higher grade of workmanship characterized almost every exhibit. Many exhibits had revolving, skeleton sections of their products, making it possible for the spectator to see and understand the operation of their machines. Grain separators, sufficiently small for the needs of individual farms were there in far greater numbers than ever before. Removable panels and cut-out sections with the machine in motion made the principles of their operation plain. The idea of standardization is being accepted and rapidly developed by manufacturers. This was particularly noticeable in the products of tractor manufacturers who are producing trucks. The same engine and parts can be used interchangeably in either truck or tractor. Belt power take-off for trucks was featured by a number of concerns. Complete seedbed preparation in one operation was featured by one manufacturer.

A number of new tractors made their first public appearance. A small steam driven tractor for small farm use, of a design radically different from the ponderous steam tractors, attracted considerable interest. Several companies are working along similar lines, so it seems entirely possible that the small steam driven tractor may win a place in power farming, achieving to some extent the supremacy which the gas engine now holds. Several foreign makes were also exhibited.

There were numerous exhibitions of small garden tractors and implements.

Tractor drawn implements was the idea back of implement companies' exhibits. The difference in the wear and strain of tractor drawn implements over horse drawn implements is being recognized more and more by implement engineers. New designs and construction have been largely governed by that fact. Implement units are being built more and more in sizes to meet the demand of tractor service. Grain separators are being built small enough for the individual farm. On the other hand, especially in tillage and seedbed preparation tools, larger units demonstrated the fact that one man is able to control a larger number of operations. This fact in a large way accounts for the economy of tractor power and the popularity of power farming. Quite a few suggestions and changes in implement design were presented, a number of which will no doubt pass the test of service and be accepted as special tractor implements.

Companies manufacturing tractor accessories were very well represented. The latest development of magnetos, wheels, carburetor, engines, spark plugs, special hitches and steering devices, governors, bearings, lugs and so on were lavishly, tho tastily, exhibited.

Distinct Progress Shown

In contrasting the product of 1921 with those of former years, one thing is evident and encouraging. Tractor and implement engineering is making progress. Freak designs were not in evidence. New designs are conservative and practical. Engineers are being guided by past experience and are not attempting radical designs with which they hope to revolutionize the tractor industry. This fact will undoubtedly have a beneficial effect on new developments.

From any viewpoint, the show was a huge success. Any spectator who viewed the 356 exhibits—all presenting the idea of power applied to farm operations—could do nothing but praise the completeness with which the idea was presented. Early attendance, in spite of rain and inclement weather, gave a good indication of the interest of farmers and dealers and even the general public in the new era of farming operations. The management of the show, particularly Mr. Whaley and the Columbus Tractor Club, deserves praise for the way the show was managed.—By G. W. McCuen.

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

COTTONSEED MEAL AS A FERTILIZER

Having the fertilizer problem on my mind, I am asking for advice as to cottonseed meal, which can be purchased for \$38 to \$39 per ton, which I think would be a good fertilizer alone. Am I right on this? What ingredients could be added and how much weight of them to a ton of cottonseed meal to make a complete fertilizer for tobacco, potatoes, oats or corn or would cotton meal not be valuable for all those crops? Is peanut meal as valuable for fertilizer as cotton meal?—S. R. G., Lancaster Co., Pa.

S. R. G., Penna.—The growers of tobacco regard cottonseed meal as a satisfactory fertilizer for their crop. This is to be accounted for by the fact that cottonseed meal contains phosphoric acid and potash as well as nitrogen. It is a relatively safe fertilizer to use under intensive methods and does not contain ingredients that would undesirable influence the quality of the tobacco. The following mixture may be recommended for tobacco.

Cottonseed meal	1000 lbs.
Nitrate of soda	200 lbs.
Acid phosphate	500 lbs.
Sulfate of potash	300 lbs.

The mixture thus made will contain some-

what less than 6% of ammonia, about 53% of phosphoric acid and 83% of potash. A mixture of this nature may be used safely at the rate of 2000 to 3000 pounds per acre.

For potatoes, corn and other general crops, plantfood may be secured more economically and more efficiently with the nitrogen derived from tankage, nitrate of soda and sulfate of ammonia rather than cottonseed meal. The potash might be derived likewise from muriate of potash. The following mixture should give good results for both potatoes and corn:

Nitrate of soda, 200 lbs.;
sulfate of ammonia, 200 lbs.;
tankage containing 10% of ammonia, 250 lbs.;
acid phosphate, 1150 lbs.;
muriate of potash, 200 lbs.

This mixture will contain about 53% ammonia, 10% of phosphoric acid and 5% of potash. It could be used at the rate of 1400 to 1800 pounds per acre for potatoes, and at the rate of 400 to 600 pounds per acre for corn, with good results.

Peanut meal is variable in composition. The best grades of peanut meal will contain between 6 and 7% of nitrogen, and about 14 to 15% of potash. Peanut meal is, for this reason, not as high grade a fertilizer as is cottonseed meal. However, if it could be bought cheaply enough everything considered, there should be no objection to its use as a substitute for cottonseed meal.

COKE OVEN SMOKE

I have been reading your topics on soil fertility and am interested in the ground lime rock writings published in the Pennsylvania Farmer. I live in the southwestern part of Fayette Co., Pa., near Uniontown. I have always used kiln burned lime. This lime counteracts the action of the sulphur in the coke smoke which settles on the ground, killing the vegetation. I am using either the burned lime or the ground lime rock. I would like you to please give me some information with reference to using the ground lime rock in place of the burned lime, and the results, if you know of any experiments, that have been worked out, where the coke smoke has to be taken into consideration.—F. L., Fayette Co., Pa.

F. L., Penna.—Smoke and fumes from coke may be employed: timothy, 3 pounds; orchard

ovens and blast furnaces contain a very considerable amount of sulfur. This is washed down by rain or otherwise carried down into the soil. Part of the sulfur exists in the form of the element sulfur. This is changed by bacteria into sulfuric acid, resulting in increasing the sourness of the soil to a marked degree. This will account for the beneficial results observed where burned and slaked lime have been employed near coke ovens and blast furnaces. The same result may be accomplished by ground limestone if it is remembered that ground limestone is not as efficient as burned and slaked lime for neutralizing soil acidity. For practical purposes it may be assumed that one ton of freshly burned lime is equivalent to about two tons of ground limestone. Ordinarily, a bushel of freshly burned lime, weighing about 80 to 100 pounds, when slaked will bulk up to about two bushels of slaked lime, each weighing about 65 pounds.

Aside from damage done by fumes and smoke thru increasing the sourness of the land, there is also direct damage done by fumes coming in contact with vegetation. It is possible to counteract soil acidity by using burned and slaked lime or ground limestone. On the other hand, it is not possible to counteract in any practicable way the injurious effect of smoke-laden and fume-laden air on the foliage of plants. Notable examples of law suits by farmers against extensive damage done by fumes containing sulfur are the cases of groups of farmers in the vicinity of Ducktown, Tenn., and of the Anaconda Copper mines in Montana. The Tennessee Copper Company in Tennessee, as well as the company controlling the copper smelters in Montana, have

grass, 2 pounds; red top, 2 pounds; Kentucky blue grass, 2 pounds; Italian rye grass, 1 pound; meadow fescue, 2 pounds; red clover, 2 pounds; alsike clover, 2 pounds; white clover, 2 pounds, and sweet clover, 2 pounds. This mixture may be used at the rate of 20 to 24 pounds per acre.

Prior to seeding down, there should be harrowed into the surface soil ground limestone at the rate of two tons per acre. A fertilizer consisting of a mixture of 400 pound of acid phosphate, 50 pounds of nitrate of soda and 50 pounds of muriate of potash per acre should be used. This should give the young plants a good start.

Another method that may be more suitable for land that is badly depleted would be to plow the land in the spring, fit the ground thoroughly and plant soybeans or a mixture of soybeans and cowpeas, seeded broadcast at the rate of 1 1/2 bushels per acre. It would be desirable before planting the soybeans to apply lime at the rate of about 1 to 1 1/2 tons of slaked lime per acre or 2 tons of ground limestone per acre, and also a fertilizer mixture consisting of 350 pounds of acid phosphate and 50 pounds of muriate of potash, 400 pounds per acre in all. If soybeans had never been grown on the particular field, it would be desirable to inoculate either with soil from a soybean field or with a commercial culture of soybean bacteria. The soybeans could either be plowed under in the fall or allowed to die on the ground, the field plowed in the following spring and oats and Canada field peas sown, using 1 1/2 bushels of each or 3 bushel of seed per acre. This crop could be harvested and fed green or made into hay. The land could then be plowed and fitted and seeded down to grass as already suggested.

OYSTER SHELLS FOR LIME

Have you any definite knowledge as to results in the use of oyster shell lime as a corrective of soil acidity? I shall be pleased to have results from some reliable tests in comparison with the common burned stone lime.—A. C. R., Bedford Co., Pa.

A. C. R., Penna.—Oyster shells are sold for agricultural purposes both as raw ground oyster shells and as burned shells. Samples of burned shells analyzed at the New Jersey Agr. Experiment Station contain approximately 63 to 66% of actual lime (quick lime). Aside from the lime, there is present in oyster shells about 1/3 to 1/4 of one per cent of phosphoric acid. Raw ground oyster shells contain 90 to 95 per cent of carbonate of lime, or about 50 to 53 per cent of actual lime.

Experiments carried on at the New Jersey Agricultural Experiment Station and elsewhere show that oyster shell lime compares very favorably with limestone as a source of lime for correcting soil acidity. Because of the porous structure of the shells and their high content of lime, the product made from them dissolves readily in the soil and is efficient in neutralizing soil acidity. The burned shells contain no nitrogen. On the other hand, the raw ground shells contain about one-half of one per cent each of phosphoric acid and nitrogen. Hence, finely ground shells are not only a suitable material for neutralizing soil acidity, but also possess some value for supplying 10 pounds each per ton of phosphoric acid and nitrogen. The tests made at the New Jersey Experiment Station show that oyster shell lime has given fully as good results as ground limestone.

As we understand it, the master mind who is chosen for secretary of the interior need not necessarily be a stomach specialist.

This is a good time to plan crop rotations and to plot next summer's field work.

OUR JOB is to serve our readers. Whenever you are puzzled, write to us and we will help you if we can.
—The Editors

The shortest way to do many things is to do only one thing at a time.—Cecil.

Freight Rates

ANKIND does many things which illustrate the truth contained in the story of the woman (or was it a man) who killed the goose that laid the golden egg. One of the latest examples is that of the boosting of freight rates. There is evidence on every hand that the excessive rates in force today are responsible in no small degree for the slump in business. The decrease in passenger traffic which is so noticeable now as compared with a year ago is in a large measure due to the high cost under present rates. People stop buying or using anything when it becomes too expensive. If the managers of railroads are honestly seeking for a means of increasing their incomes, let them look into this feature; or, it is possible that the Government's guarantee of profits makes them indifferent to the rules of ordinary business?

Implement Repairs

FROM SOME source the report has been started that the manufacturers of farm implements and machinery will stop making and selling parts and repairs for their products. We have received a few inquiries as to whether the report is true or not and we learn the misinformation is being circulated verbally in some localities. We have investigated the matter and find there is absolutely no truth in the report. Manufacturers will continue to make and sell repairs as in the past.

A little reflection should convince any one that such a policy on the part of a manufacturer would be suicidal. Business men are not so short-sighted as to think they could adopt such a plan in order to sell new machinery and stay in business.

The Spur of Necessity

WHILE WE have no sympathy with any movement to destroy labor organizations or to lessen the advancement made towards establishing the principle of collective bargaining, there is one underlying principle which it is well for leaders in all lines to remember. It may be termed briefly, the spur of necessity. The advancement of the race and the development of the individual are due to the necessity for work and accomplishment more than to anything else. Any policy that eliminates the necessity for individual effort dwarfs the individual whether it be in the form of an assured income without effort or a guaranteed wage for a minimum effort.

Pennsylvania Farmer

February 26, 1921.

Standardizing a day's work for a uniform return removes the greatest spur to achievement and tends to reduce mankind to a dead level. If this principle should be generally adopted it would mark the end of progress.

The following testimony of a railroad company before the Labor Board is interesting in this connection:

Piece work car repairers decreased 41.4 per cent in efficiency under the system of guaranteeing a fixed minimum rate per hour.

Piece work air brake repairers decreased 32.4 per cent in efficiency at one shop and 33.4 per cent at another.

Piece work painters working on passenger cars decreased 25.07 per cent in efficiency after the change.

Piece workers in the brass foundry decreased 10.8 per cent in efficiency; the time required to perform various operations in the foundry increased by from 9.7 per cent to 50 per cent when the men were no longer paid by the piece.

Similarly it took a man 1.47 hours longer to paint a locomotive under the hourly system of pay than it did when he was paid by the amount of work he turned out. The time required for a man to paint a freight car increased 27.89 hours when the man was paid by the hour instead of by the job.

The average number of wheels bored per hour at the Huntingdon shops decreased 47 per cent when the change was made from the piece work basis to the hourly basis.

A Bird Bill

A BILL to place the quail in the list of song birds in order to protect it has been introduced in the Pennsylvania Legislature by Hon. S. F. Zook of Blair County. At present it is classified as a game bird, for which there is an open season, when it may be slaughtered by hunters. The quail subsists entirely upon insects and weed seeds and for this reason is the farmer's greatest ally in the fight against these pests.

The killing of quail is not a business for real sportsmen. The quiet, clannish nature of these birds makes shooting of them about like attacking a flock of sheep with a dog and shotgun. True, they do make excellent eating, but their economic value in the destruction of pests far outweighs their food value. The farmers and others interested in this matter should write a card or letter without delay approving the passage of the bill and send it to Hon. S. F. Zook, House of Representatives, Harrisburg, Pa. Granges, clubs and other organizations should do the same. Farmers, you can put this over if you will, but action must be prompt.

Our Washington Letter

The Bureau of Crop Estimates of the Department of Agriculture has issued a statement showing that the farmers of the United States have lost more by the recent slump in prices of farm

products than the war-time price gains.

Commenting on this statement, Dr. T. C. Atkinson, Washington representative of the National Grange, says that unless an equilibrium is reached between the prices of farm products and industrial products, the country is going to see a more serious situation than it is now passing thru. A high level of prices for industrial products and a low level for farm products will inevitably mean a food shortage.

After carefully considering the question of a fair ratio of wages for the mechanic and the farmer, deducting the lower cost of living in the country and the farm and garden supplies, Dr. Atkinson concedes that the man in the country should receive one-third less than the worker equally well qualified receives in the city; if a mechanic in town has a \$6 a day the man on the farm should receive \$4 a day.

The Bureau of Markets is greatly encouraged over the success of the Federal warehouse act. Officials of a wool warehouse company in Chicago report that they received 33,000 consignments in 1920, six times as many as they had in the preceding year. The four warehouses owned by this company were the first wool warehouses licensed under the United States warehouse act, and the company officials say that their increased business is largely a result of this. They feel that the department's approval establishes business confidence.

How to Be Happy

"If I knew how to omit," wrote Stevenson on the art of composition, "I should ask no further knowledge."

The art of writing and the art of living are alike in this respect. Happiness in a life, like beauty in a work of art, depends largely upon what is left out.

When you crowd your living room with bric-a-brac you destroy the comfort of your home. When you fill your days with trifling pleasures and petty occupations you make happiness impossible.

Only they may be happy who do not expect too much. He who looks for special favor is sure to be disappointed. He who enters life unprepared for the world's neglect lays up future discontent for himself. He who seeks to fill his life beyond its natural capacity will end his day like a tired child, worn out with too much pleasure.

He shall be happy who makes honest use of what he has and spends no pity on himself because it is not more; who demands from imperfect men and women no more than imperfection can deliver; who looks honestly at himself, knows his limitations, recognizes his powers and spends what God has given him courageously.

—Alvin E. Magary.

No other bird is so valuable fortunately a number of these unfriendly Congressmen are members of the Interstate and Foreign Commerce Committee of the House, having the French Truth in Fabric bill in charge.

It is the suggestion of friends of the measure that the representatives of the wool growers, the woolen manufacturers, the textile and clothing industries meet in conference and agree upon a truth in fabric bill which will be sufficiently acceptable to these interests to insure its enactment in Congress. There is a growing sentiment for a law which will put a stop to the selling of shoddy for fleece wools in woven textiles. It is thought that this sentiment should be drafted into a practical, effective bill which will enable its friends to answer satisfactorily the arguments of its opponents.

A "National Corn Meal Week" under authority of Congress, to be observed early in April, is proposed in a resolution introduced by Representative Charles F. Reavis, of Nebraska. Its object is to aid the farmers to obtain a better price for corn by increasing the demand for corn products.

At this date it is apparent that the only chance of any packer legislation being enacted

February 26, 1921.

during this session of Congress is that the Hagen Committee amendment may pass the House and Senate without amendment.

As the hearings before the House Committee on Banking and Currency on the farm organizations proceed, it develops that the object of the committee in making the investigation is to secure information as to the relation existing between the county agents and the American Farm Bureau Federation, with the view, if possible, of divorcing the county agents from the farm bureaus. There seems to be an idea prevailing in Congress that the county agents are promoting the farm bureau federations and that the state and national federations could not exist without the funds appropriated by the government for the support of the county agents.

Dr. A. C. True, director of the States Relations Service of the Federal Department of Agriculture, was called before the committee, February 15th, to testify as to the relations of the county agent to the local farm bureau. Dr. True said the States Relations Service had nothing to do with recent farm bureau federation development; that while the States Relations Service had found the county farm bureaus to be the best means of co-operating with farmers in demonstration and educational work, the county agent was under obligation to assist and advise all the farmers whether members of the farm bureau or not, and to co-operate with any farm organization that desired such co-operation.

In reply to the question as to whether the farm bureau depended upon the county agent system for its existence, Dr. True said he could see no reason why the farm bureau should not exist without the county agent. He said instructions had been sent to county agents not to participate in membership drives of the farm bureaus, and he explained that the States Relations Service did not co-operate with the farm bureau federations as it does with the county farm bureaus. The Department of Agriculture took no part in organizing the state and national federations, and the States Relations Service is not responsible for anything the federation is doing.

Dr. True said he did not want a condition where farm organizations are quarreling with one another. It is to be regretted that leaders of one or two of the farm organizations represented in Washington, especially the National Board of Farm Organizations, have used these hearings as a means of attacking the American Farm Bureau Federation before a Congressional committee. It can have no other effect than to lessen the influence of all the farm organizations in Congress.

The Emergency Tariff bill passed the Senate by a vote of 43 to 30, February 15th. It was opposed by several New England Senators and favored by a number of Southern Senators. The bill was primarily designed as a temporary agricultural relief measure, carrying tariff duties on a few farm products. As it goes back to the House it carries a number of amendments which will tend to delay its progress in conference. Senate leaders claim to have positive assurances from the President that he will veto the bill.—E. E. Reynolds.

HARRISBURG LETTER

An Expensive Intermission.—Perhaps because a good excuse was hard to find members of the Pennsylvania Legislature did not try to give any when they voted to have a recess this week. Some of the members of the House registered disapproval by negative votes, but no one discussed the matter and everyone, men on per diem salaries included, ducked out of town as soon as possible after the gavel fell. It was a curious legislative proceeding. For some time it has been apparent that the legislative leaders were waiting for the Governor to complete his bills and various commissions to send in their propositions and that the administration was waiting for Senator Boies Penrose and his friends to show their hands. As a consequence there was not much being done, which is not an unmixed blessing when one considers the number of bills passed in former sessions, and most of the members appeared to welcome the chance to go home and attend to their own affairs rather than stay here for half a week's consideration of public business. Meanwhile, with State Administration and various elements insisting on economy the general assembly goes home and the pay of something like 300 persons connected with the Legislature runs along just like the pay of the legislators themselves. But, by the time the lawmakers come back there will be a program, something which has been lacking ever since the session opened. The Governor will have his bills prepared and the forces opposed to any increase of revenue will have made up their minds, while the battle over a constitutional convention will have been formed.

The Administration's Crux.—The Sprout Administration is now at its critical point and the next two months will determine whether the Governor is to be a big factor in state affairs the remainder of his term or go the way of some predecessors. He does not intend to go into the back-ground if he can help it. If his propositions for raising revenue fall of passage and it is necessary to cut the appropriations and the educational, welfare and similar projects much in the public eye and ear of late do not materialize there will naturally be a dimming of prestige. It presents a very interesting situation to the student of Pennsylvania politics and one which cannot fail to be of interest to the man on the fence. The Sprout Administration has a good bit of paper out, to use an advertising expression, and there are elements active at the State Capitol which would like to interfere with the performance.

The Agricultural Bills.—Attention is being given by the State Department of Agriculture to business and legislation affecting that branch of the government and the interests it is charged to keep in a way that is refreshing when one considers some sessions of the past. The clashing of views over coal and manufacturing taxes, constitutional conventions, enforcement codes and similar measures are not concerning Secretary Fred Rasmussen as much as a measure that will weed out the bad seeds and enable the state to get first hand data in regard to products. The Secretary expects to have a new pure seed bill ready at an early date, the result of his observations and various studies made by his people. Presentation of the bill will depend upon the taxation code which was drafted by a commission after long study and which would place the assessment and collection of taxes on a basis costing a third less than the present. Just how this would affect the proposed statistical system has not been worked out. The Secretary believes the pending bills relative to pay for men and teams uprooting thistles will go a long way toward getting rid of weeds where seriously needed. Original plans were found to be ill suited to conditions in a diversified state like Pennsylvania.

The State Fair Bill.—While the people interested in the county fairs have opened attacks upon the state fair project and a bill is in hand for a fair on a rather circumscribed scale plans for the big State Fair are going ahead and the bill will soon appear. It will leave to the Governor and Secretary and a commission the selection and acquisition of a site and the details. What was aimed at in the recent conference was launching a proposition that would assemble the best and be a state affair, rising above the purely local exhibition which has a well defined place.

Road Bids In Hand.—The first opening of bids for 1921 road construction, covering about 100 miles, showed a downward movement in prices and considerable competition for business. In fact there were over 125 bids presented and on only one project were no bids received. The figures are being gone over and if satisfactory some awards will be made as early as \$65,000 to \$70,000 a mile does not appear to have caused local committees to object. Instead, they are demanding the roads no matter what the cost, a rather different situation from some years ago. Extent of the remainder of the state program will depend upon the highway bills now in progress thru the houses. It is believed a pretty ambitious program will be launched and that counties will spend about a dozen millions for their shares.

Midwinter Fires.—Weather conditions, lack of snow and dry periods have resulted in more forest fires in January and February than known in a long time and caused some apprehension among foresters for the spring period. The state's forest fire service will probably be called upon to be ready for a severe test and preparations to demonstrate efficiency have been going on. Incidentally, bills now pending would enable a very effective organization to be built up and efforts to get them passed in time to meet the coming danger period are under way on "The Hill."

Protecting Poultry.—Bills to protect domestic animals and poultry from reckless hunters and automobilists are in the Legislature and bid fair to pass in spite of ridiculous amendments to the game code, which would restrict careless shooting, make a small game season in November and permit revocation of hunters' licenses for offenses seem to be favored, although they have yet to face some fights. It may be added the fishermen's license bill provides that owners of lands thru which streams flow or upon which they abut are relieved from licenses, just as they are in the case of hunters' licenses.

Quarantine Stands.—Secretary Fred Rasmussen in announcing the potato wart quarantine would have to stand in the districts where establishment has let it be known the state is prepared to help in the growing of immune seed potatoes. In some communities the state will assist the men selected by neighbors to grow the potatoes for seeding.

The Weasel Bounty.—While the reports of the State Game Commission show a pretty general move toward getting rid of weasels the agricultural counties are lagging in sending in scalps. The state has literally hundreds of thousands of dollars for such payments. A new bill just presented would fix a bounty of \$1.50 for each weasel.—Hamilton, Harrisburg.

Pennsylvania Farmer

5-237

paid for by the government, up to \$67.50 for grade cows and to \$162.50 for registered stock. Before inspection the individuals are appraised and the prices set are accepted after test. The conditions, in many ways are unusually favorable now for having the herds freed of disease. Milk is low in price, cows are also, and a reduction of the troublesome surplus of milk is badly needed, besides the greater need of establishing a clean herd at the earliest opportunity, as good business principle and as a protection to human health.

Two New State Leaders.—E. V. Underwood, of Buffalo has been selected as the new secretary of the State Farm Bureau Federation, to succeed H. E. Babcock. N. F. Webb, a dairy farmer of Cortland, has been elected as the new president of the G. L. F. Exchange, the biggest farm organization engaged in buying farm supplies in the East.

Milk Problems.—Milk dealers of Auburn refuse to lower the retail price of milk, asking 14 cents per quart and paying farmers 5 and 6 cents. Farmers are taking exception to this, and another lively clash may come there, to the benefit of consumers, if the dealers do not act fairly.

Vegetable Shipments.—Vegetables from state points and from the South and Texas are failing to sell for enough to cover expenses of shipment in some cases. On one carload of Florida lettuce the grower had to lose the cost of producing it, and \$152 extra to pay the freight to New York. Texas spinach fared even worse last week. Dozens of New York farmers have had similar experiences. Consumers are buying and eating less, a situation that demands serious consideration.

Daylight Saving.—Despite the farmers' very active and determined protests it is feared that they may be forced to accept a compromise on the repeal of the daylight saving law—cutting the time shorter in which it shall prevail. Governor Miller will stand by his pre-election pledges to farmers, but both houses of the Legislature may not take the same stand that they did a year ago in voting against it. The cities are very active in urging daylight saving.

Cabbage Moving Slowly.—Despite a trebled production in this state, which supplies about half the total consumption of the country shipments so far have been below normal, as there is so little demand. Reports from 39 truck associations and large growers in the state indicate an increase of 29 per cent in commercial storage of cabbage compared to last year. Other leading cabbage states report an average increase in similar storage of 13 per cent.—E. M. F.

NEW JERSEY NEWS

Gypsy Moth Bill.—Governor Edwards has signed a bill by House Majority Leader Rowland of Camden, authorizing the State Department of Agriculture thru the State Entomologist to treat upon lands for the purpose of destroying the gypsy moth, which is already credited with having infested certain sections of New Jersey and causing damage. Quite some money will soon be devoted by the state to the extermination of this pest, which is an enemy to crops. The Governor has also affixed his approval to a measure by Assemblyman Hastings, who comes from the agricultural county of Somerset, which appropriates to the Department of Agriculture \$30,000 to indemnify owners of cattle condemned under the tuberculin test, the money to be expended under the direction of the State Bureau of Animal Industries. The executive signature has also been placed on a bill by Senate Majority Leader Mackay, of the farming county of Bergen, this measure increasing the membership of the State Department of Health from eight to ten, the two additional members to be women. The passage of the bill was in conformity with a platform pledge of the party at the November election, and the move was heartily endorsed by the women's division of the G. O. P. This was the busiest week of the Legislature, Monday being signalized by the holding of twelve hearings. The daylight saving measure is soon to be up for action in both the Senate and House, and it will meet with vigorous opposition by the representatives of the rural sections, who after hearing what the agriculturists had to say about the losses that would arise by its enactment, feel that they are justified in fighting it. William H. Read, of Tenant, introduced the speakers for the farmers at the hearing. Harry Herbert, of Tenant, spoke for the potato growers. He declared that he raised three millions of potatoes in 1920, and that the potato growers were a unit in deciding that daylight saving was a detriment to the farmer and a source of great expense. Clement Lewis, a peach grower of Burlington, stated that daylight saving would work great hardships to the peach crop in that part of South Jersey, and that under the plan, the peach scale would develop rapidly in the state. He accounted for this by saying, that when the trees were sprayed in the early morning while the dew was on them, the liquid would run off and no benefit would be obtained. John Barclay, a prize apple grower of New Jersey, put forth the same kind of an argument in relation to fruit trees. Other farmers spoke along similar lines, saying that it was impossible to get their help out in the orchards and fields to work when the dew was still on the trees and ground, and that they could not cut hay and carry on any other kind of work at an earlier hour.—Kelly, Trenton.

NEW YORK LETTER

Tubercular Inspection Appraisal.—So many cattle are being condemned for tuberculosis in Madison County that the milk supply is threatened and inspection is only begun. The accredited herd system is used. Condemned cattle are

Lowe Brothers

Another Historic Proof of Paint's Preservative Qualities

WHEN the old Liberty Bell, at Philadelphia, pealed forth its message of freedom, from the belfry of Independence Hall, it also sounded a guarantee of protection against the British tyrant. Nearly a century and a half has since passed, and still both the brick and wood portions of the old building have withstood equally well the ravages of weather. It is a striking example of paint's wonderful protective qualities. The way to prevent decay, is not to let it start. That's what good paints do. Of greatest importance: the economical time to paint, is before it is needed, not after.

Lowe Brothers paint is sold by the one best dealer in each town.

Cost of Production

Come Down

With prices at new low levels, it is even more important than when the "sky was the limit," to watch cost of production and equip yourself to meet competition. You cannot produce Milk or Beef in competition with the farmer who has a silo unless you are equipped as he is.

Tecktor us and Darby Silos are genuine cost production savers. Start cutting cost by taking advantage of our PRESENT DISCOUNTS—which we guarantee are as large as will be made during 1921. Write at once for illustrated catalog, prices and discounts.

The Montgomery County Bull Association

THE Montgomery County, Pa. Bull Association has just completed its first year's work, having purchased its first bulls Dec. 15, 1919. This Association started its work with eight purebred Holstein bulls and about 45 members representing about 560 cows.

A bull was purchased for each block of 70 cows. Each member paying \$15 per cow for each cow entered. This you will see, allows for the cost of the bulls to be \$1050 each, a figure that permitted the purchase of excellent bulls of the very best breeding.

The bulls were selected by a committee consisting of three members of the Association, together with County Agent A. K. Rothenberg and R. R. Welsh of State College. They were instructed to select nothing but good, straight individuals, whose dams or grand-dams had made at least 800 lbs. of butter, or 20,000 lbs. milk in 365 days, and which were sold under a 60-day retest guarantee for tuberculosis.

There are many advantages in an Association of this kind. By this plan a farmer can breed his cows to a high class bull for the same initial cost as to his own ordinary or scrub bull. Besides, it is necessary to replace a bull every two or three years to avoid inbreeding. By joining the bull association we have the use of a different bull every two years, for as long as they live, from the one initial cost. Again the cost of keeping the bull is only 20 to 25 per cent as much as where each farmer owns his own bull, as each member pays his share according to the number of cows he has shares for. Another great advantage is the line-breeding which these bulls make possible. Again, by using a bull 2 years in one block, then moving to another and so on, we have an excellent opportunity to demonstrate what any

Itchen's Golden Daisy of Chilmark 61690—14,367 lbs. Milk; 669.64 lbs. Butterfat

A glance at the breeding of the animals selected will convince any one that these qualities were secured. Space will not permit going over the breeding in detail. Practically all the dams of these bulls are under full age, many of them being first calf heifers, so there is an excellent opportunity for them to materially increase their records.

The path of this Association has been by no means a smooth one. There are many things peculiar to this section that make the work difficult. One of these is the fact that Montgomery County dairymen have been buyers of dairy cattle rather than breeders. As a result, there has been quite a lot of impatience on the part of some, as the returns are necessarily slow for the first few years.

Another point is the fact that, for years, Montgomery County has been buying tuberculosis in dairy cows which are shipped out of other sections. The Association is working to have all herds placed on the accredited, t. b. free list. This condition makes the loss from this cause a heavy one: there has been a large percentage of reactors in a number

The calves of each succeeding generation will contain more and more of the blood of these sires so that every record made by one of their daughters will increase not only her own value but the value of every other animal of the same line of breeding, which at the end of a few years will be practically all the animals raised by all the members of the Association.

The Association plans to advertise as a body. This will allow a much greater display than would be possible if each man did his own advertising. Besides it will attract more buyers to this section if they know they can select cattle from 45 or more tuberculosis tested herds, all bred to bulls of thousand-pound breeding—E. P. Bechtel.

Funny how inconsistent some folks are. Take that man, for instance, who weighs out every speck of feed so his cattle will get a balanced ration, then turns around and sells all the milk and butter which his children need for health, growth and happiness.

TYRONE AND WARRIOR'S MARK, PA., COWS MAKE FINE RECORDS

The Tyrone Cowtesting Association has completed another 30-day record and present a splendid list of high producers. Thirty-two of the 277 cows on which records were kept, qualified for the merit class. The owners and number of merit cows are as follows:

Taylor Bros., 6; C. M. Waple, 6; Geo. Rumbarger, 5; W. T. Kephart, 4; W. A. Beck, 3; Peck Bros., 3; A. S. Ellenberger, 2; H. L. Glazier, 2; W. A. Stewart, 1.

The cow leading in milk production is one owned by Geo. Rumbarger, Warrior's Mark, with a record of 2065 lbs. The cow is followed closely by one owned by Taylor Bros., Warrior's Mark, that produced 1889 lbs. This latter cow leads in butterfat production with 73.6 lbs. to her credit and followed closely by Mr. Rumbarger's cow with 68.1 lbs. of butterfat.

The average for the highest ten cows is 1398 lbs. of milk and 52.3 lbs. of butterfat for the 30-day records. This is the best average the Association has had so far.—Paul Taylor, Tester.

BARN SAFETY-FIRST

A bad fall may be avoided in the barn by painting the lower step of the stairs white or else using the whitewash brush on it. In the half darkness of most barns the last step of the stairs is always a danger spot. This plan may be carried out in the cellar stairway when the cellar is poorly lighted.—A. J. B.

WOMEN OPERATE MILKER

In regard to our experience with the milking machine, we think it a labor-saving device. We keep from 6 to 10 cows and my daughter and I do the milking as my husband is alone on a large four-horse farm and has enough to do without bothering with the milking. So my daughter and I came to the conclusion that we would get a machine. We not only find it a great help but a good success. It works out all right as a labor-saving proposition and gives satisfaction. The cows like it as well or better than hand milking. We never had any bother at all. We put it on heifers that never lifted a foot. It is very easy to handle. We have a 14 horsepower engine that gives us satisfaction and is easy for a woman to start. I take care of it myself, take it apart and clean and repair it if necessary. With all this, it is much better than milking by hand. We thing it very nice to sit down and watch milk flow into a bucket in a sanitary way.

Then, too, we have a separator house by the cow stable so we have it convenient to empty the milk and run the separator with the same line shaft that runs the milker, and have the separator so adjusted that, while not in operation, by handling a small lever, it is thrown out of gear, thus we have perfect control of the machine. That gives us the skimmed milk for our calves. They are loose in pens close by, with places to protrude their heads which makes it easy to feed them. And we also have a small 2 horsepower engine for house use. It runs the washing machine and wringer at the same time, turns the churn, makes ice cream, turns the grindstone, and we find that the farmer's wife doesn't need to be a slave any longer.—Mrs. Fred H. Stamm, Clinton Co., Pa.

THE EXPERT EXPLAINS How Plenty of Fresh Drinking Water INCREASES MILK PRODUCTION

There must be liquid to make liquid; and the more water a cow drinks, the more milk she will give. That has been proven. Your outdoor tank in cold weather freezes—or the water is so cold the cows will drink but little. In summer the water is stale or too warm—and they won't drink much of that.

Fresh, pure water—direct from the well—is the kind the cows like—the kind they drink lots of—the kind, therefore, that increases milk production.

That is what a Milwaukee Air Power Water System will give you—for bowl or feed trough. And it will enable you, without trouble, to keep the

cow barn clean, avoiding danger of disease and infection and loss of profit by milk refused on account of uncleanness.

This is one of the ways in which a Milwaukee Air Power Water System actually pays in dollars and cents. There are many other ways. Find out about them. Write for our big new, free catalog. Find out all about the system—how it can be installed on your farm, how it operates, how it benefits you—and what other practical farmers say about its paying features. And we will send you the name of our Water and Light Expert near you.

Write us today.

Green Mountain SILOS

STABILITY COUNTS

Your Green Mountain Silo, with the popular hip roof, will never need an apology. It is built to stand up permanently—just as any other farm building is expected to do. Every groove and joint is made to fit tight—both for permanence and silage protection. Every stave is treated in creosote preservative. Hoops are of extra heavy steel with rolled (not cut) threads. They cost us more but they stand unusual strains. Doors fit like a safe—always tight. Wooden ladder runs; no iron to fret the fingers. Green Mountain Anchorage system holds silo absolutely firm and upright.

A beautiful silo—with nut-brown side walls and bright red cedar roof. Write today for detailed circulars. Special inducements for early orders.

These Seven Cows

Fed From the Product of One Acre Every Day for Over a Year

61 tons of Ross' Eureka Silage Corn to the acre is the yield reported by Mr. Reynolds, Farm Superintendent of the Worcester State Hospital, Massachusetts. At 30 lbs. each per day, this would feed seven cows for one year and eight months.

Ross' Eureka Corn grows the tallest, has the most leaves, is very short jointed and will produce more tons of good sweet silage per acre, than any other variety. We have been selling Eureka corn for nearly 40 years and we know before shipping that it will grow under favorable conditions. This corn usually germinates 90 per cent or better.

Ross' Eureka Corn

Complete line of Farm Seeds: Oats, Rye, Barley, Wheat, Buckwheat, Cow Peas, Vetch, Soy beans, Essex Rape, all varieties of Field and Pasture Corn, Grass Seeds, including all kinds of alfalfa and Sudan Grass. Also full line of Agricultural Implements, Fertilizer, etc. Our 120-page catalog mailed free on request.

The Plow that Fits the Eastern Farm

THE John Deere-Syracuse Two-Way Plow is famous throughout the East for seed-bed making and wearing qualities. Built in a factory that has for 50 years been studying Eastern conditions and building plows to meet them, the Syracuse Two-Way can truly be called the "Plow that Fits the Eastern Farm."

JOHN DEERE SYRACUSE TWO-WAY BUILT IN THE EAST FOR THE EAST

The Syracuse Two-Way is practically self-operating. The patented Auto Foot Frame Shift, regulating width of furrow when plowing on side hills and around curves, is controlled by a slight pressure on the foot levers. The Clevis Shift and the Horse Lift are both automatic. This plow does away with dead furrows and back ridges, where these are not desirable; it plows out the corners

of irregular fields, and works up close to fences. And remember, it is equipped with Syracuse bottoms—good work insurance. Study your plowing conditions. Then go to your John Deere dealer and have him explain the Syracuse Two-Way Plow. You will find that it is just the plow you need to fill your requirements

Write us for folders describing this plow. Also ask for "Better Farm Implements," a 114-page illustrated book telling all about the John Deere full line of farm tools. It's free. Address John Deere, Moline, Illinois, and ask for Package ST-836

HORTICULTURE

Constructing a Hot Bed

THE possession of a hotbed is possible and practicable to any one who can handle a saw and hammer and is in possession of a few odd pieces of plank and an old window sash. About six weeks is usually saved by the use of a well constructed and properly cared for hotbed. The best location for the hotbed is on the south side of a building or high wall, where it will be exposed to the full warmth of the sun and protected from the west wind. The ground should slope away from the beds to afford the necessary drainage, and a warm loam is more desirable than a clay soil for this reason. When the soil of the location of the hotbed is unfavorable it should be removed entirely in digging the pit, and a more favorable soil—warm loam mixed with leaf mould, substituted in its place. The pit for the hotbed should be two or three feet deep, and three feet wide by six feet long is a convenient size for a single bed of two sashes. Any

serviceable hotbed sashes. A notched stick should be fixed to the side or front of the frame to hold the sash at any desired height when open. Stout strips of wood should extend from the front to the back of the frame, at the point where the sashes meet, for the edges to rest on.

The heat in a hotbed is, usually supplied by fermenting manure mixed with a quantity of straw or leaves which have been used as bedding. In choosing manure for the purpose, only that which has been gathered from grain-fed horses should be used.

Never use cold manure from a heap. The manure for the pit may be placed directly therein, packing it down sufficient to fill every corner and placing of the sash in position. If manure is in good condition and the day is bright, fermentation will begin at once, and as soon as the heat has penetrated every part of the mass it may be tramped down (very evenly) and the earth applied; but before putting on the earth a

Part of Horticultural Exhibit at New Jersey Products Show

sound plank or even inch stuff available may be used for the frame, which is constructed around corner posts of two or three-inch stuff. These posts should be long enough to rest on the bottom of the bit and extend a foot above ground at the front and about eighteen inches at the back. The frame need not necessarily extend more than two feet below the surface of the soil, unless the land is infested with moles and ground mice, in which case the boards had better extend to the bottom of the pit, and should be free from knotholes which will admit vermin, or if holes are unavoidable, they should be masked with pieces of tin. Nail the back, side and end boards to the upright posts securely. If four boards are used one of the end boards should be sawed in two diagonally, and one of these sections used for the top of each end, setting the straight edge down, the slanting edge forming the slanting side of the frame. Care should be taken in sawing the board to leave a straight and smooth edge so that the sash will fit evenly.

Old window sashes, providing they are sound and well glazed, make

A JERSEYMAN'S METHOD OF FORCING VEGETABLES

In my many years' experience as a market gardener the demand for earlier outdoor vegetables has seemed to increase from year to year, and in many cases a few days difference in time of maturity may mean the difference between loss and profit. The modern private or market gardener realizes this, for we see him trying to protect plants from sudden changes of weather by plowing loose soil as a temporary protection, or covering them with flower pots, Jer-

sey baskets, sheets of paper, or anything that comes handy. Many attempts have been made by vegetable growers to use individual plant frames in some form of wooden box with a pane of glass on top held in place by a stone. These always gave ideal results, as far as they went, which was really not very far. It took too long to make them; the cost was prohibitive; they were cumbersome; their use was limited to a few hills of low growing plants for home use. As a commercial proposition, they were out of the question.

Paper pots have been used extensively for starting seeds of cucumbers, cantaloupes, melons, lima beans and sugar corn, and have proved of great value in shortening the time required to mature these crops. With proper care and the use of hotbeds and cold frames one can have nice, vigorous plants all ready setting when congenial warm weather comes. After setting out these nice plants, when conditions seem to be perfect, and settled into summer, how often does it occur that in a day or two, before the plants have become accustomed to their new environment, a high, chilly wind comes up, buffets them around, makes them look sick, and lingers for days before they take on new life? We can't put them back again, yet they need protection. Such conditions often made me wonder whether planting the seed in the field in the first place would not have been better.

These disappointments made me renew my determination to discover some way of using that individual plant frame, for then I could have protection and cold frame conditions at any time. I had been using paper pots for several years with more or less success. They were of a good grade, mostly 3 1/2 inches square. The idea occurred to me, why not plant the seed direct in the open ground, cut the bottom out of the paper pot, place it over the hill and put a piece of glass over the top, and see what would be the result.

I put the paper pot on top instead of on the bottom, and dispensed with the cold frame. This paper pot used as a plant frame was in good condition, even after being exposed to the weather for several weeks. So I set to work and made larger and more substantial collapsible cardboard frames, coating them with paraffine wax as a waterproofing. A wire across the top and down the sides extending below the frame served to hold the glass in place, and also by pressing the wire into the soil it served as an anchor. Here I had something with all the advantages of the wooden individual plant frames, and none of its disadvantages; durable, portable, light, inexpensive and very simple. I made others on the same principle, but taller to accommodate tomatoes and other tall plants. These have the glass in front, on the south side, the largest being 18 inches high in the front. Watermelons and sugar corn seldom gain much as potted plants; they will not stand the change of replanting from cold frame to the open ground, even when weather conditions are favorable.

For the earliest planting of seeds of these vegetables, it is much better to plant them in their permanent quarters, the little cardboard boxes 4 1/2 inches square over each hill will force the crop at least two weeks earlier; they will be three or four inches high and ready for the first cultivation before other seeds planted same time are barely peeping out of the ground.

Summer Warmth-in Coldest Winter-all through your home

Cozy, generous warmth, upstairs and down! Every room warmed to your entire satisfaction. That is HOMAKER'S guarantee.

OUTDOORS, winter's chilling blast, raw spring winds or keen fall breezes! It is all one to the home equipped with a HOMAKER. For indoors you will never feel anything but the even, perfectly controlled temperature of a balmy summer day -- ideal for comfort, for health, for work and for rest.

As to expense, stoves to heat only part of your home would cost nearly as much. And for fuel economy, you have yet to learn what that means unless you have talked to the owner of a HOMAKER.

This truly remarkable saving in fuel has become possible only because HOMAKER is the direct-action furnace. Moving currents of warmth start replacing the cold air upstairs and down, almost the minute the fire is kindled. No heat is lost. None radiated into the cellar. HOMAKER requires comparatively little coal, wood, gas or other fuel -- because it wastes practically none.

And finally, HOMAKER conquers the dust and dirt evil. It is, above all else, the furnace for health.

HOMAKER

"HOME-MAKER"
PIPELESS FURNACE

NEW houses or old -- it is all the same with HOMAKER. A rough floor plan of your home enables our heating and ventilating experts to decide just where to place the furnace. The installation is easily made in a day or two without fuss or bother. Then--take down your stoves for the last time and let HOMAKER live up to its guarantee.

Special HOMAKER Features

ALL heat-radiating castings in HOMAKER are centered. That means direct-action heating -- and no burning out of feed pouch. The outer casing and the register are both larger than usual, assuring free circulation of the warmed air, and so saving fuel.

HOMAKER has a quadruple casing, the inner section being of laminated construction (2 sheets of steel between which is placed a heavy layer of air-cell asbestos). This improved insulation conserves practically all of the heat. Instead of heating the cellar, the warm air travels directly up through the register and thence into every corner of every room in the home.

You shake or dump HOMAKER from an easy upright position with all its doors tightly closed. No dust or ashes can escape. Fuel saving grate that dumps from the edge instead of center. Fullwidth ash door -- pit easy to clean. The smoke collar runs clear through the castings -- no gas can leak out.

Our free book, "The Story of HOMAKER", gives you the plain facts about the pipeless furnace method of heating and all of the reasons why HOMAKER is the better pipeless furnace. Please send for it today. No obligation.

Comparative Food Values

AT THE Home economics conference at the recent meeting of Pennsylvania State Grange the question of food value of milk and dairy products was under consideration when a man said he would like to hear about the food value of bread and potatoes and some of the other foods that we use. He remarked that he had recently heard the statement that "a pound of potatoes is equal in food value to eight eggs." This is one of the types of food comparisons that are very misleading.

To understand why let us consider just what this statement means and whether it covers the entire nutritive value of each food mentioned. When investigators began their study of foods, they thought that the chemical analysis of foods was all that is necessary in determining the nutritive value. By chemical analysis they determined the amount of protein or body-building material, the amount of carbohydrate (starch and sugar), amount of fat and of mineral matter in each kind of food.

When fuel is burned in an engine, heat is produced, also energy to do work. Food digested and used in the body machine produces the energy to do work and to maintain the heat of the body.

Food is Fuel to the Body

The chemical processes within the body, which make energy from food

available, are similar in nature to the processes which take place when fuel is burned in a stove. Since this is true, the fuel value of a food is determined by the amount of energy it yields to the body. This energy is calculated by measuring the amount of heat produced when the food is burned or digested in the body. A unit had to be determined for measuring the amount of heat produced when food is completely burned or assimilated. The unit chosen was called a calorie, which means heat. It is the amount of heat required to raise one pound of water (2 cups) four degrees Fahrenheit.

Pound of Potatoes vs. Eight Eggs

When we say that one pound of potatoes equals eight eggs in food value, we mean that a pound of potatoes when burned (digested) produces as much heat in the body as eight eggs.

But fuel or energy is not the only value of food.

(1) In addition to fuel, the body requires protein to maintain the muscle tissue. And children require more protein in proportion to their size than adults do in order to build up their growing muscles as well as to maintain their muscle tissues.

Let us compare potatoes and eggs as to their protein content. Potatoes have less than three per cent of their food value in the form of pro-

tein. This makes them practically negligible as a source of protein for the growth and maintenance of the muscle tissues.

Eggs, on the other hand, have about fourteen per cent of their food value in the form of protein. And the quality of egg protein ranks next best to that of milk for growth and repair of tissues. Hence, one of their special values is as a source of protein. Thus, you will readily see, a pound of potatoes cannot possibly equal eight eggs as a source of protein for making body tissues.

(2) The body requires mineral matter for building and repairing muscle issues, bone making, and for regulating the body processes, such as digestion, absorption, elimination of waste, etc. The regulation of the human machine corresponds to the oiling of an engine, or other machinery.

Potatoes and eggs have about the same amount of mineral matter, but the mineral matter differs in kind. Potatoes are valuable more particularly for the potash salts which they supply. Eggs, on the other hand, are especially valuable for the iron in which they are very rich. Potatoes afford practically no iron. Both contain other minerals in varying amounts. Iron is one of the minerals likely to be deficient in the diet unless foods known to be rich in it are

Milk to Drink, Custards to Eat, and Bread and Butter in Plenty Make Her Grow

(3) To maintain the general well-being of the body and, in the case of children, to favor normal growth, the body also needs certain other substances, which are called vitamins. There are three kinds of vitamins. One, called fat-soluble A because it dissolves and occurs in such fat as cream, when absent from the diet results in a characteristic eye disease and retarded growth of body. Another, called water-soluble B because it is dissolved and occurs in water in leafy vegetables, when absent from the diet results in a paralysis of the nerve system known as beriberi. The third vitamin, called the C vitamin, is also soluble in water, and is the corrective for scurvy.

Potatoes do not contain fat soluble A, but they do contain the water-

soluble B and C vitamins. Cooking, however, destroys in great measure the C vitamin.

Eggs and cream are the best sources of the fat-soluble A vitamin. They also contain water-soluble B. But they have only a small amount of the C vitamin, which occurs most in green vegetables and fruits.

Potatoes have a certain food value not afforded by eggs, in that they contain considerable fiber or woody matter, which is very essential to give bulk for proper intestinal action. Fiber is supplied by vegetables, cereals and fruits.

Thus, you will see why the food value of a food cannot be determined by its energy value alone.

One pound of potatoes may equal eight eggs in fuel or heat value, but that tells one nothing about the amount and quality of protein, nothing about the kind and amount of mineral matter, or the kind and amount of the three vitamins afforded by either potatoes or eggs.

And thus you will readily see that no two foods or classes of foods are equal in food value to one another. Each has its special food value and properties, and people must know how to select the foods that will meet the body needs. Therefore, in determining the value and place of a food in your diets, you must consider the following points:

(1) Does a food provide protein? If so, what is the quality of that protein? Just as steel makes a better knife than some other metals, so some kinds of protein are better adapted in the human digestion to making and maintaining muscle tissue. The milk and egg protein, next the meat proteins and lastly the vegetable proteins is the order of the adaptability of proteins in human nutrition.

(2) Does a food supply any or the right sort of mineral matter? It is especially necessary to know whether a food is rich or poor in lime, particularly in the case of children; also whether it contains phosphorus or iron, since these three minerals are likely to be lacking in the diet unless foods known to be rich in them are eaten.

(3) Does a food supply one or all of the three vitamins, which are so necessary in maintaining the general well-being of adults and growth of children?

(4) Does a food contain fiber?

(5) Does a food afford fuel, and if so, is it in the form of starch, sugar or fat? Starches, sugars and fats are interchangeable in the diet so far as furnishing heat and energy are concerned, but it is much better for the body health if starches and fats furnish a greater amount than sugars.

We would urge upon every one, particularly mothers and fathers, the necessity of informing themselves about the food values of the various foods, and of securing this information from reliable sources. Then you will know how to interpret such statements as the one that the gentleman at the Pennsylvania State Grange referred to, as quoted above. And you will know how to make the right selections and combinations of foods adequately to meet the requirements of your bodies and the demands upon them, and the needs of the bodies of your growing children.—Pearl MacDonald, Penna. State College.

The vinegar from the jar of pickled peaches or pears may be used for making boiled salad dressing. Such a dressing is particularly good on fruit salads.

THE NEW "IN-LAWS"

Most prospective brides feel a sort of sinking sensation as they contemplate meeting a crowd of ready-made relatives, and wonder apprehensively just what sort of reception they will get from the members of the bridegroom's family. The vulgar jokes about mother-in-law, the knowledge of unpleasantness in more than one family connection, the uncertainty as to the likes and dislikes of the various members, the lack of intimate association that would guard against blunders and all the other phantoms that rise up to take a little of the lustre off the days before and after the wedding ceremony make the girl a bit nervous and anxious. Men are different, and their lives are made up of bigger things, but the average prospective bride wants everything perfect and delightful in her home life and her dealings with her new relatives, at least for the first year or two until her wedded happiness is on a secure foundation.

First of all, if it can possibly be avoided, never live with the new relatives even for a brief period, and never make lengthy visits to them during the honeymoon. By that same sign do not expect your husband to want to live in your old home. A manly man wants to establish his own home from the first, and any marriage that views living with either family of the bride or bridegroom should be looked upon with suspicion, unless the parents simply cannot get along alone. There are occasions when the young couple must forego the pleasure of a separate establishment to take care of invalids, but that is a different proposition. The young folks who want to remain in her home or his to save money, or to have greater freedom to go about or to avoid responsibility to discover later that they have lost something very precious and vital out of their wedded existence, and nothing in later years can make it up to them. When duty demands living with elderly people then there can be no debate, but the normal, happily married young folks desire a separate home from the very first.

Frank, free, kindly treatment without affectation from the first is the only safe course in dealing with the new relatives. Some mothers-in-law are reserved and almost cold in their bearing, not because they dislike the newcomer, but because they are of that nature. The young woman who rumples up her mother-in-law's hair, sits in her lap, kisses her effusively and calls her pet names may be only doing what she has done with her own mother for years, but she had better find out first whether the home atmosphere in her husband's home is of the kind that makes a display of affection welcome. A well-bred, conservative attitude toward the young man's relatively will do much toward insuring future serenity and pleasant relations.

Too little intimacy at first rather than too much is wise, and there should ever be a lack of making a confidant of any new relative and telling home news. There are other topics of conversation and until a cordial, friendly everyday basis of affection is established between the bride and "his folks" she should refrain from retailing news of her old home or her new one. The entire absence of criticism on both sides will do much toward insuring future harmony.—Hilda Richmond.

How about flowers around the house this summer?

PENNSYLVANIA FARMER PATTERNS
Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3495.—Becoming Frock for a Little Miss.—It is cut in 4 sizes: 4, 6, 8 and 10 years. A 6-year size will require 2½ yards of 36-inch material. Checked or plaid gingham, chambray, seersucker, kid plaid, gingham, poplin and repp, also linen and serge could be used for this style. Pattern, 10 cents.

3041.—A Practical Style.—This model is good for percale, lawn, gingham, chambray, drill, khaki and flannel. As here shown, blue checked gingham was used with collar and cuffs of white pique. Pattern is cut in 4 sizes: 2, 3, 4 and 5 years. Size 4 will require 2½ yards of 36-inch material. Pattern, 10 cents.

3473.—School Costume.—It is cut in 4 sizes: 8, 10, 12 and 14 years. A 10-year size will require 2½ yards of 42-inch material for the skirt, in serge, gabardine, plaid or check suiting, and 2½ yards of 42-inch Indian Head, drill, flannel or poplin, for the blouse. Gingham, chambray and percale are attractive too, for this style. Pattern, 10 cents.

3465.—An Attractive Style.—It is cut in 3 sizes: 12, 14 and 16 years. A 14-year size will require 3½ yards of 38-inch material. Embroidered serge or velvet, satin and serge combined, crepe de chine and satin, taffeta, duvetyn and gabardine may be used for this style. Pattern, 10 cents.

HOMESPUN YARN

A sleeping porch is one kind of life insurance.

Any house is large enough for an old-fashioned taffy pull, and it's a sport worth reviving.

Tin or glass containers are best for cereals, flour and spices. Such containers are proof against dust, moisture and insects.

You think you are working for better crops and herds, but you are working for that home over on the hill, and your wife and children, and if you lose them you do not care about your better herds.

THE NAME THAT IDENTIFIES SUCCESSFUL PIPELESS HEATING

The name CALORIC identifies the heating plant with the exclusive patented features that make pipeless heating such a wonderful success.

It identifies the heating plant that is sold under a Money-Back guarantee of your satisfaction—and that has made good its guarantee in actual service in over 125,000 homes.

The Caloric fills every room with summerlike warmth in coldest weather—and cuts fuel bills $\frac{1}{2}$ to $\frac{3}{4}$. There is only one Caloric. The name is on the feed door. It's your bond of heating satisfaction.

The Caloric actually costs less than the stoves necessary to heat same size building. May be installed in a day, no plumbing, no pipes to freeze. Burns any fuel. Write today for Caloric Book—or see nearest dealer.

TALKS WITH THE BOYS

EDITOR'S LETTER

To the Boys:

Several of the boys have told what they have raised or produced as their own. That is a very interesting thing and helps other boys to see what they might do also. Of course, a boy could not expect to spend all his time working for himself and board free at home, but every boy has or should have some spare time in which he could raise a calf or pig or some chickens; or, if he prefers, a crop of some kind.

There are several things to be learned in carrying on any kind of business. In the first place, a boy should read and study the best methods of doing the work he undertakes. He should read everything he can find on crops, feeds, fertilizers, cultivation, etc., which has a bearing on the thing he intends doing.

In the second place, he should learn to keep accounts with his work. On one page of an account book put "Dr." at the top. That means debtor. Put on that page all the cost of production such as labor, seeds, feed, fertilizer, etc. Then on the other page put "Cr." which means credit. After the work is finished and the product sold place here the amount received, or the market value in case you keep it.

The third thing to learn is to use wisely the money you get. Here is where we Americans fail mostly. We have no trouble making money but we have trouble keeping it. I do not mean that money should be hoarded, but we should learn how to get the most good out of it after we have it; that is, learn to spend it so that it will benefit and not harm us. But there is another lesson we Americans have not learned. We must learn not only to spend wisely, we must learn also to spend less than we make. There comes a time to most people when they cannot work and earn money, and unless they have put part of their money away as they made it they become objects of charity. It is said that more than half of the people above seventy years of age have to be supported by some one else, or by the public. So, saving is a much needed lesson.

Boys, I am afraid you will think this is not an interesting letter. Well, lots of things in life are not pleasant, but they are necessary. My experience teaches me that most farmers have not learned all the things I have mentioned in this letter, and it is my great desire that the young farmers will learn them while they are young so that they may get along better.

I would suggest that you join a Boys' Club of some kind. Write your County Agent if there is no club in your neighborhood and have him start one if possible. Then, when you write letters you will have something to tell that will help other boys.

We have a small farm of our own but do not live on it. We live nearby on a 66-acre farm, but also farm our own farm. I enjoy farming and hope to see more boys get interested in the boys' page of the Pennsylvania Farmer so that soon a whole page will be full.—S. F. S., Berks Co., Pa.

*Sincerely,
The Editor*

LETTERS FROM THE BOYS

Dear Editor—What was the matter with the boy's corner two weeks ago? I missed it, so thought I would write and help it along. I am a boy eight years old. I live on a farm 2 1/2 miles from State College. It is a very

pretty place, I go there quite often. Farmer's Week is a great time there; then we boys see every thing. I will be glad to tell the boys what I can of State College. I have no brothers or sisters so I help father and mother both. I love the farm. I raise ducks and help mother with the chickens. Last year I made \$22 out of my ducks. I go to school and am in the third grade. I have 22 head marks, and haven't missed a word in spelling in two years. I like to go to school and like my teacher. In the evenings I study and play games with father, mother and my Uncle Jim, who lives with us. We have great times. We have been having a fine time coasting. I think the boys' page is going to be great. I enjoy reading the boys' letters. Mother says it's almost as good as the household page but I think it's better, and if there isn't room for both every week, cut out the household page sometimes.

This is a pretty long letter but hope we will all be friends, and will hear from some of the boys next week.—Robert Glenn, Centre Co., Pa.

Dear Editor—I was surprised and delighted to find a boys' page in the Pennsylvania Farmer. My father has taken it several years and I have not seen the page before this year. I enjoy reading the whole page. I have a 22-caliber rifle but I do not shoot it much because I am only 11 years old. I expect to help in the sugar-bush this year. We have 500 trees.

My father owns 15 purebred Holstein cattle. Two years ago I went with my father to Philadelphia to attend a Holstein-Friesian meeting. The association took us down the Delaware River to Wilmington and out to the Dupont farm, Winterthur, and it was some farm.

I have one and a half miles to walk to school but we can shorten the distance by crossing the creek when the ice is on. I am in the seventh grade. I have one sister older and one younger than myself. I have no brothers, so I have to work quite hard.—Leon Palmer, Bradford Co., Pa.

Dear Editor—I certainly am glad that the Pennsylvania Farmer has some space for a boys' page which I enjoy reading. I am fourteen years old and live on a farm. I have two brothers, one older than I, and one younger. The oldest one works in the city and the other one and I are at home. We do a little trapping in winter and also raise Flemish hares. I save all the money from the furs and hares and put it in the bank.

We have a small farm of our own but do not live on it. We live nearby on a 66-acre farm, but also farm our own farm. I enjoy farming and hope to see more boys get interested in the boys' page of the Pennsylvania Farmer so that soon a whole page will be full.—S. F. S., Berks Co., Pa.

He Feels Just "So-so"

First Class—I got a frightful stitch in my side at the rally the other day.

Second Class—Yes, that's the worst of being "hemmed" in by the crowd.

Few fathers are ever forgiven by their sons for not saving when they were young.

The Voice of the Pack

by Edison Marshall

CHAPTER IX

THE Lennox house seemed very silent when, almost an hour later, Dan turned his horse into the corral. He had rather hoped that Snowbird would be at the door to meet him. The darkness had just fallen, and all the lamps were lighted. He strode into the living-room, warning his hands an instant beside the fireplace. The fire needed fuel. It had evidently been neglected for nearly an hour.

Then he called Snowbird. His voice echoed in the silent room, unanswered. He called again, then went to look for her. At the door of the dining-room he found the note that she had left for him.

It told, very simply and plainly, that her father lay injured in his bed, and he was to remain and do what he could for him. She had gone for help to the ranger station.

He leaped thru the rooms to Lennox's door, then went in on tiptoe. And the first thing he saw when he opened the door was the grizzled man's face on the pillow.

"You're home early Dan," he said. "How many did you get?"

It was entirely characteristic. Shaggy old Wolf is too proud to howl over the wounds that lay him low, and this gray old bear on the bed had partaken of his spirit.

"Good Lord," Dan answered. "How badly are you hurt?"

"Not so bad but that I'm sorry that Snowbird has gone drifting twelve miles over the hills for help. It's dark as pitch."

And it was. Dan could scarcely make out the outline of the somber ridges against the sky.

They talked on, and their subject was whether Dan should remain to take care of Lennox, or whether he should attempt to overtake Snowbird with the horse. Of course the girl had ordered him to stay. Lennox, on the other hand, said that Dan could not help him in the least, and decided him to follow the girl.

"I'm not often anxious about her," he said slowly. "But it is a long walk thru the wildest part of the Divide. She's got nothing but a pistol and a lantern that won't shine. Besides—I have had bad dreams."

"You don't mean—" Dan's words came hard—"that she's in any danger from the animals—the cougars—or the wolves?"

"Barring accidents, no. But, Dan, I want you to go. I'm resting fairly easily, and there's whisky on the table in case of a pinch. Someway—I can't bar accidents tonight. I don't like to think of her on those mountains alone."

And remembering what had lain beside the trail, Dan felt the same. He had heard, long ago, that any animal that has once tasted human flesh loses its fear of men and is never to be trusted again. Some

animal that still hunted the ridges had, in the last month, done just that thing. He left the room and walked softly to the door.

The night lay silent and mysterious over the Divide. He stood listening. The girl had started only an hour before, and it was unlikely that she could have traversed more than two miles of the steep trail in that time. He could fancy her toiling ever upward, somewhere on the dark ridge that lay beyond. Altho the horse ordinary did not climb a hill more swiftly than a human being, he didn't doubt but that he could overtake her before she went three miles farther. But where lay his duty—with the injured man in the house or with the daughter on her errand of mercy in the darkness?

Then the matter was decided for him. So faint that it only whispered at the dim, outer frontiers of hearing, a sound came pricking thru the darkness. Only his months of listening to the faint sounds of the forest, and the incredible silence of the night enabled him to hear it at all. But he knew what it was, the report of a pistol. Snowbird had met an enemy in the darkness.

He called once to Lennox, snatched the shotgun that still stood where he had placed it in the corner of the room, and hastened to the corral. The mare whickered plaintively when he took her from her food.

CHAPTER X

Even in the darkest night, there is one light that never brings hope or cannot lead. It is not a twinkling, joyous light like that mysterious will-o'-the-wisp that now and again has lured travelers into the marshes to their death. Nor can any one ever mistake it, or be soothed and cheered by it. It always appears the same way—two green circles, close together, in the darkness.

When Snowbird first heard the step in the thickets beside her, she halted bravely and held her lantern high. She understood at last. The very extremity of the beams found a reflection in two very curious circles of greenish fire: a fire that was old upon the world before man ever rubbed two sticks together to strike a flame. Of course the dim rays had simply been reflected in the eyes of some great beast of prey.

She identified it at once. Only the eyes of the felines with vertical pupils, have this identical greenish glare. The eyes of the wolves glow in the darkness, but the circles are usually just bright points. Of course it was a cougar.

She didn't cry out again. Realizing at last the reality of her peril, her long training in the mountains came to her aid. That did not mean she was not truly and terribly afraid. The sight of the eyes of a hunting animal in the darkness calls up memories from the germ-plasm—deep-buried horrors of thousands of generations past, when such lights glowed all about the mouth of the cave. Besides, the beast was hunting her. She couldn't doubt this fact. Curiosity might make a lion follow her, but it would never beget such a wild light

of madness in his eyes as this she had just seen. Only the frenzied pulse of wild blood thru the fine vessels of the corneas could occasion such a glow as this. She simply clamped down all her moral strength on her rising hysteria and looked her situation in the face. Her hand flew instinctively to her side, and the pistol leaped in the lantern light.

But the eyes had already blinked out before she could raise the weapon. She shot twice. The echoes roared back, unbelievably loud in the silence, and then abruptly died; and the only sound was a rustling of leaves as the cougar crouched. She sobbed once, then hurried on.

She was afraid to listen at first. She wanted to believe that her pistol fire would frighten the animal from her trail. She knew, under ordinary conditions, that it would. If he still followed, it could mean but one thing—that some unheard-of incident had occurred to destroy his fear of men. It would mean that he had knowingly set upon her trail and was hunting her with all the age-old remorselessness that is the code of the mountains.

For a little while all was silence. Then out of the hush the thicket suddenly crashed and shook on the opposite side of the trail. She fired blindly into the thicket. Then she caught herself with a sob. But two shells remained in her pistol, and they must be saved for the test.

Whisperfoot, the cougar, remembering the lessons of his youth, turned from the trail when he had first heard Snowbird's step. He had crouched and let her pass. She was walking into the wind; and as she was at the closest point a message had blown back to him.

The hair went straight on his shoulders and along his spine. His blood, running cold an instant before from fear, made a great leap in his veins. A picture came in his dark mind: the chase for a deer when the moon had set, the stir of a living thing that broke twigs in the thickets, and the leap he had made. There had been blood, that night—the wildness and the madness and the exultation of the kill. Of course there had been terror first, but the terror had soon departed and left something lying warm and still in the thickets. It was the same game that walked his trail in front—game that died easily and yet, in a vague way he did not understand, the noblest game of all. It was living flesh, to tear with talon and fang.

All his training, all the instincts imbedded in him by a thousand generations of cougars who knew this greatest fear, were simply obliterated by the sudden violence of his hunting-madness. He had tasted this blood once, and it could never be forgotten. The flame leaped in his eyes. And then he began to stalk.

A cougar, trying to creep silently on its game, does not move quickly. It simply steals, as a serpent steals thru the grass. Whisperfoot stalked for a period of five minutes, to learn that the prey was farther away from him at every step.

He trotted forward until he came close, and again he stalked. Again he found, after a few minutes of silent creeping thru the thickets, that he had lost distance. Evidently this game did not feed slowly, like the deer. It was to be a chase then. Again he trotted within one hundred feet of the girl.

Three times more he tried to stalk before he finally gave it up altogether. This game was like the porcupine—simply to be chased down and taken. As in the case of all animals

that hunt their game by overtaking it, there was no longer any occasion for going silently. The thing to do was to come close and spring from the trail behind.

Though the fear was mostly gone, the cougar retained enough of that caution that most wild animals exhibit when hunting a new game so that he didn't attempt to strike Snowbird down at once. But as the chase went on, his passion grew upon him. Ever he crept nearer. And at last he sprang full into the thickets beside her.

At that instant she had shot for the first time. Because the light had left his eyes before she could find aim, both shots had been clean misses. And terrible as the reports were, he was too engrossed in the chase to be frightened away by mere sound. This was the cry the man-pack always made—these sudden startling sounds in the silence. But he felt no pain. He crouched a moment, shivering. Then he bounded on again.

The third shot was a miss too; in fact, there had been no chance for a hit. A sound in the darkness is as unreliable a target as can possibly be imagined. And it didn't frighten him as much as the others.

Three times he crouched, preparing for a spring, and three times his tawny tail began that little up-and-down motion that is always the warning before his leap. But each time, as he waited to find his courage, the game had hurried on.

Now she had her back to a tree and was holding the lantern high. It glinted on his eyes. And the fourth time she shot, and something hot and strange singed by close to his head. But it wasn't the pain of one quill from a porcupine, and it only increased his anger. He waited, crouching and the girl started on.

She was making other sounds now—queer, whimpering sounds not greatly different from the bleat that the fawn utters when it dies. It was a fear-sound, and if there is one emotion with which the wild beasts are acquainted, in all its phases, it is fear. She was afraid of him then, and that meant he need no longer be in the least afraid of her. His skin began to twitch all over with that terrible madness and passion of the flesh-hunters.

This game was like the deer, and the thing to do was to lie in wait. There was only one trail. He was simply following his instincts, not conscious intelligence, when he made a long circle about her and turned back to the trail two hundred yards in front. He wasn't afraid of losing her in the darkness. She was neither fleet like the deer nor courageous like Wolf, the bear. He had only to wait and leap from the darkness when she passed.

And because this was his own way of hunting, because the experience of a thousand generations of cougars had taught him that it was the safest way, that even an elk may be downed by a surprise leap from ambush, the last of his fear went out of him. The step drew nearer and he knew he would not again be able to give his stroke.

When Dan Failing, riding like mad over the mountain trail, heard the third shot from Snowbird's pistol, he felt that one of the debts he owed had come due at last. He wanted to know, as the darkness pressed around him, that he was to be killed in the fire. And the horse staggered beneath him as he tried to locate

He showed no mercy to his mount. Horseflesh isn't made by carrying a heavy man over such a trail as this,

and she was red-nostriled and lathered before half a mile had been covered. He made her leap up the rocks, and on the fairly level stretches he loosed the reins and lashed her into a gallop. Only a mountain horse could have stood that test.

To Dan's eyes, the darkness was absolute; yet she kept straight to the trail. He made no attempt to guide her. She bounded over logs that he couldn't see, and followed turn after turn without ever a misstep.

He gave no thought to his own safety. His courage was at the test, and no risk of his own life must interfere with his attempt to save Snowbird from the danger that threatened her. He didn't know when the horse would fall with him and precipitate him down a precipice, and he was perfectly aware that to crash into a low-hanging limb of one of the great trees beside the trail would probably crush his skull. But he took the chance. And before the ride was done he found himself pleading with the horse, even as he lashed her sides with his whip.

The lesser forest creatures sprang from his trail; and once the mare leaped high to miss a dark shadow that crossed in front. As she caught her stride, Dan heard a squeal and a rattle of quills that identified the creature as a porcupine.

By now he had passed the first of the worst grades, coming out upon a long, easy slope of open forest. Again he urged his horse, leaving to her keen senses alone the choosing of the path between the great tree trunks. He rode almost in silence. The deep carpet of pine needles, wet from the recent rains, dulled the sound of the horse's hoofs.

Then he heard Snowbird fire for the fourth time; and he knew that he had almost overtaken her. The report seemed to smash the air. And he lashed his horse into the fastest run she knew—a wild sobbing figure in the darkness.

"She's only got one shot more," he cried. He knew how many bullets her pistol carried; and the danger whatever it was—must be just ahead. Underbrush cracked beneath him. And then the horse drew up with a jerk that almost hurled him from the saddle.

He lashed at her in vain. She was not afraid of the darkness and the rocks of the trail, but some Terror in the woods in front had in an instant broken his control over her. She reared, snorting; then danced in an impotent circle. Meanwhile, precious seconds were fleeing.

He understood now. The horse stood still, shivering beneath him, but would not advance a step. The silence deepened. Somewhere in the darkness before him a great cougar was waiting by the trail, and Snowbird, hoping for the moment that it had given up the chase, was hastening thru the shadows squarely into the ambush.

Whisperfoot crouched lower; and again his long serpent of a tail began the little vertical motion that always precedes his leap. He had not forgotten the wild rapture of that moment he had inadvertently sprung on Landy Hildreth—or how, after his terror had died, he had come creeping back. He hunted his own way, waiting on the trail; and his madness was at its height. He was not just Whisperfoot the coward, that crouched in the shadow of a tall form in the thickets. The consummation was complete, and that single experience of a month before had made of him a hunter of men. His muscles

set for the leap.

So intent was he that his keen senses didn't detect the fact that there was a curious echo to the girl's footsteps. Dan Failing had slipped down from his terrified horse and was running up the trail behind her, praying that he could be in time.

Snowbird heard the pat, pat of his feet; but at first she did not dare to hope that aid had come to her. She had thought of Dan as on the far-away marshes; and her father, the only other living occupant of this part of the Divide, might even now be lying dead in his house. In her terror, she had lost all power of interpretation of events. The sound might be the cougar's mate, or even the wolf pack, jealous of his game. Sobbing, she hurried on into Whisperfoot's ambush.

Then she heard a voice, and it seemed to be calling to her. "Snowbird—I'm coming, Snowbird." A man's strong voice was shouting. She whirled with a sob of thankfulness.

At that instant the cougar sprang. Terrified though she was, Snowbird's reflexes had kept sure and true. Even as the great cat leaped, a long, lithe shadow out of the shadow, her finger pressed back against the trigger of the gun. She had been carrying her gun in front of her, and she fired it. This last time, with no conscious effort. It was just a last instinctive effort to defend herself.

One other element affected the issue. She had whirled to answer Dan's cry just as the cougar left the ground. But she had still been in range. The only effect was to lessen, in some degree, the accuracy of the spring. The bullet caught the beast in mid-air; but, even if it had reached its heart, the momentum of the attack was too great to be completely overcome. Snowbird only knew that some vast, resistless power had struck her, and that the darkness seemed to roar and explode about her.

Hurled to her face in the trail, she did not see the cougar sprawl on the earth beside her. The flame in the lantern almost flicked out as it fell from her hand, then flashed up and down, from the deepest gloom to a vivid glare with something of the effect of lightning flickering in the sky. Nor did she hear the first frenzied thrashing of the wounded animal. Kindly unconsciousness had fallen, obscuring this and also the sight of the great cat, in the agony of its wound, creeping with broken shoulder and bared claws across the pine needles toward her defenseless body.

But the terrible fangs were never to know her white flesh. Someone had come between. There was no chance to shoot; Whisperfoot and the girl were too near together for that. But one course remained; and there was not even time to count the cost. In this most terrible moment of Dan Failing's life, there was not even an instant's hesitation. He did not know that Whisperfoot was wounded. He saw the beast creeping forward in the weird dancing light of the fallen lantern, and he only knew that his flesh, not hers, must resist its rending talons. Nothing else mattered. No other considerations could come between.

It was the test; and Dan's instinct prompted coolly and well. He leaped with all his strength. The cougar bounded into his arms, not upon the prone body of the girl. And she opened her eyes to hear a curious thrashing in the pine needles, a strange grim battle that, as the lantern flashed out, was hidden in the darkness.

And that battle, in the far reaches

A Story for Children

Johnny's Mistake

Johnny Turned and Ran as Fast as He Could

For two weeks, Grandpa and Johnny worked patiently with Billy and at last Johnny was allowed to drive him alone. Mr. Brown kept telling John-

ny not to get angry and tease Billy, on the farm for two weeks and he for he had a very bad temper. So was beginning to get lonely. He far, Johnny had done very well. He had done everything he could think of during that time—gather the eggs, watch the cows, feed the chickens, and dozens of other things that were very interesting at first. Now he was looking for something new to do.

"Gr-and-pa! Hi! Gr-and-pa!" he called, running out of the house. "Here!" boomed back Grandpa. Brown's big voice.

Johnny went into the big red barn where Mr. Brown, his grandpa, was trying to conceal something white, back of himself.

"What's that white thing you're trying to hide?" inquired Johnny curiously.

"Do you really want to know?" Grandpa. "Well, it's a billy-goat! I got him for you to play with. Your father wrote and said you could stay the rest of the summer so I got him for you to drive."

"Oh, goody! goody!" cried Johnny, jumping up and down. "Let's drive him, right away."

"Not so fast there, young man," warned Grandpa Brown as Johnny sprang towards his new playmate. "You'll have to be very careful or maybe you won't like him so well. If he gets mad, I'm afraid little Johnny would not stay on his feet very long."

"Oh, I'll be so careful, and won't it be heaps of fun? It will be just like having a horse—but I have no wagon."

Mr. Brown silently pointed to a shiny little green wagon in the corner and in the wagon was some beautiful new harness with red trimmings.

"Oh-h-h," was all Johnny could say.

of the Divide, passed into a legend. It was the tale of how Dan Failing, his gun knocked from his hands as he met the cougar's leap, with his own unaided arms kept the life-giving breath from the animal's lungs and killed him in the pine needles. Claw and fang and the frenzy of one death could not matter at all.

Thus Failing established before all men his right to the name he bore. And thus he paid one of his debts—of his life, as the code of the frontier has always decreed—and in the fire of danger and pain his metal was tried and proven.

(Continued Next Week).

Blame the Driver

He tried to walk across the street with his legs, light his pipe with his hands and mouth, see a pretty girl with his eyes and think about his errand with his brain, all at one and the same time. And now he ain't.

ny not to get angry and tease Billy, on the farm for two weeks and he for he had a very bad temper. So was beginning to get lonely. He far, Johnny had done very well. He had done everything he could think of during that time—gather the eggs, watch the cows, feed the chickens, and dozens of other things that were very interesting at first. Now he was looking for something new to do.

"Gr-and-pa! Hi! Gr-and-pa!" he called, running out of the house. "Here!" boomed back Grandpa. Brown's big voice. Johnny went into the big red barn where Mr. Brown, his grandpa, was trying to conceal something white, back of himself. "What's that white thing you're trying to hide?" inquired Johnny curiously. "Do you really want to know?" Grandpa. "Well, it's a billy-goat! I got him for you to play with. Your father wrote and said you could stay the rest of the summer so I got him for you to drive."

"Oh, goody! goody!" cried Johnny, jumping up and down. "Let's drive him, right away."

"Not so fast there, young man," warned Grandpa Brown as Johnny sprang towards his new playmate. "You'll have to be very careful or maybe you won't like him so well. If he gets mad, I'm afraid little Johnny would not stay on his feet very long."

"Oh, I'll be so careful, and won't it be heaps of fun? It will be just like having a horse—but I have no wagon."

of the Divide, passed into a legend. It was the tale of how Dan Failing, his gun knocked from his hands as he met the cougar's leap, with his own unaided arms kept the life-giving breath from the animal's lungs and killed him in the pine needles. Claw and fang and the frenzy of one death could not matter at all.

Thus Failing established before all men his right to the name he bore. And thus he paid one of his debts—of his life, as the code of the frontier has always decreed—and in the fire of danger and pain his metal was tried and proven.

It was the test; and Dan's instinct prompted coolly and well. He leaped with all his strength. The cougar bounded into his arms, not upon the prone body of the girl. And she opened her eyes to hear a curious thrashing in the pine needles, a strange grim battle that, as the lantern flashed out, was hidden in the darkness. And that battle, in the far reaches

Give a mean man a little authority and his meanness will rise to the surface like scum on a frog-pond.

The early bird catches the worm and turns it into profit.

Inside of a week the whole town was talking about Ephraim Brown's new Andes Furnace

"Going to break a rule for once and put some exclamation points in this letter."

THE first we knew about the big stir that Ephraim Brown's Andes One Pipe had made was this letter: "Dear Phillips & Clark, that Andes One Pipe Furnace I put in is a crackerjack! The house is just as warm and comfortable as can be, day and night, and we've had some mighty cold weather out in this town the last few days. It's fine. And I can see already that it's saving fuel money for me. You never had a better booster in any town than I am right now . . ."

Mr. Brown was right. We never did have a better booster. He must have talked about his Andes to almost everyone in town. We found out that he even gave a party to show it off. He had an advantage over us because he could *show* people what we had been trying to *tell* them. We knew all along that the Andes was a guarantee of warm, healthful, economical heat. We knew that putting in an Andes was like opening your door to a flood of warm, summer sunshine. But all Mr. Brown had to do, when he met a neighbor who complained about his poorly heated home, was to take him home and let him *feel* the good, satisfying heat his Andes was giving.

"Cold? Why my house is just like summertime. Come in and I'll show you my Andes Furnace."

You can imagine how it would be. A freezing winter day after a night of bitter frost and raging wind; cold enough to freeze the marrow in your bones. And then you *feel* the heat of the Andes. What a contrast to find a house cozy and warm as toast in every room while yours is full of draughts and chilly corners, and your family wearing sweaters and sitting close to the stove.

"The Andes saves fuel money."

Gentlemen:

I am interested in saving fuel money. Please send me your free, illustrated booklet called "Better Heating for Less Money."

NAME

ADDRESS

STATE

2

Now you take an Andes. You can put it in complete and have a fire in it and have a warm house, warm all over, inside of twenty-four hours. Just think of it — getting rid of all the discomfort of cold weather inside of only twenty-four hours. It's the greatest advance ever made in heating appliances, because it not only goes in easily and quickly with no expense or confusion of ripping open walls or floors to put in heat pipes, but it also often saves from one-third to one-half of the amount of fuel you formerly burned. It's a money-saver and it gives you the heat comfort you always wanted.

Letters are coming to us every day from people who have at last found winter heat comfort. For instance, on this page there is a picture of Mr. Frank Fraleigh's house in Rhinebeck, N.Y. Mr. Fraleigh says:

"Gentlemen — F. Rosencranz installed one of your Andes One Pipe Furnaces, No. 210, in my house of six rooms and bath. It has done more than the work of two stoves, and we are well pleased with it."

"In this house is a money-saving Andes."

The water pans in the Andes hold eight gallons of water with evaporating surface five times larger than in any other furnace. They are low down where the water can't get hot enough to boil. As a result no steam comes up into the rooms and the air takes up only the natural amount of water which guards your health.

We guarantee the Andes in this way, if you are not perfectly satisfied with your Andes it will be taken out and the full purchase price returned to you. Write us for a copy of our free book, "Better Heating for Less Money."

Use this coupon to send for free book.

"Come right in everybody where it's warm."

Modern Schools For Country Children

The First of a Series of Articles on Consolidated Schools—By R. P. Crawford

(Editor's Note—This is the first of a series of five articles dealing with consolidated rural schools written for the Pennsylvania Farmer. The author has traveled approximately 10,000 miles studying the best rural schools in America and gathering material for these articles. He is recognized as an authority on this subject.)

GOOD-BYE to the one-room school. It is a sad farewell for many of us, but a happy one for others. Fifty thousand of the little red and white buildings that once dotted the landscape of the open country are no more, or with barred windows suggest that they no longer are the scenes of readin', writin' and 'rithmetic, emphasized by liberal applications of the hickory stick. Instead the boys and girls go to fine up-to-date buildings, every bit as good as their city cousins, riding in automobile busses, a thing which not so many years ago would have been thought impossible.

Those of us who live in states where the consolidated school is a new development would find the progress that has been made in many of our more fortunate states almost incredible and indeed difficult to believe. Indiana has more than 1000 of these new kind of schools, Ohio more than 900, Iowa more than 400 consolidated schools either erected or under construction, and Minnesota more than 300, while Colorado notwithstanding the mountainous character of that state, has more than 100 such schools. About 50,000 of the little one-room schools have been abandoned the country over to make room for the 12,000 fine modern buildings, in which these boys and girls receive high school educations, just as good as the city boys and girls.

It does not necessarily follow that these consolidated schools are located in town. A very large number of them are set right out among the farms. In a great number of cases the people in the tiny villages and the surrounding country have gone together and erected a school, thereby securing educational facilities far better than could have been obtained if they had each maintained their own schools. In practically no cases are consolidated schools located in towns or cities of any considerable size.

It does not necessarily follow that in every case a consolidated school should be erected and one-room schools abandoned, but in thousands of places in the state and in the surrounding states such schools afford practically the only solution of giving the country boys and girls an adequate education.

Iowa's Remarkable Development

Iowa is remarkable in the de-

velopment of consolidated schools. It took approximately seventeen years for Iowa to secure its first seventeen consolidated schools, but it took only six years to secure the next 300. During the last school year approximately one new consolidated school district was formed for every day the schools of the state were in session. In that state, approximately 3000 one-room rural

schools have been closed, and more than 50,000 children are being transported every day to consolidated schools.

Those who are acquainted with only the little one-room schools would certainly be amazed at many of the modern school buildings in Iowa. The first place that we shall visit will be the Orange township community near Waterloo, Iowa. Here is found not only a fine consolidated school, but also perhaps one of the most elaborate country churches in the United States, and a community life and development that is remarkable. Probably the Orange township school is one of the most imposing country schools to be found anywhere. It is set well back from the roadway with five acres of grounds, well laid out in front with shrubbery and trees. The school building was erected in 1916 at a cost of \$52,000. Then a home for the janitor was also erected nearby at a cost of \$2,000, and more recently a house for the superintendent was completed at a cost of \$4,000. When I visited this school some months ago, there were 244 students enrolled. Out of this number seventy were enrolled in high school. Before the consolidated school was established there were ten little country schools with a total enrollment of 140. There was no high school work offered in the township either, and perhaps only fifteen or twenty boys would leave the township each year for further education. The school district itself embraces thirty-eight sections and twelve busses are used for transportation. High school boys furnish teams and are employed as drivers at salaries from \$50 to \$75 a month.

Community Spirit Important

The community spirit that prevails in this township is one of its remarkable features. The school house is in use nearly every night in the week for some community entertainment or meeting.

The community literary society meets every Friday and everyone takes part in the program. The Orange township band of thirty pieces is an important organization. The last day of school, even when the district schools were in operation, has always been made an important celebration, with picnic dinner, games for adults and children, and the baseball game. Each fall the harvest picnic is held on the banks of some stream, when the men and older boys teach the younger boys to swim. This country township has its own Fourth of July celebration, thereby keeping its young people at home. Here there is also a community banquet when new-

One of the 50,000 One-room Schools Abandoned

Consolidated School Located in the Village of Jesup, Iowa

comers are the guests of the others. Of course, the church plays an important part in community life. It was erected a few years ago at a cost of approximately \$40,000. It is heated by steam, lighted by electricity, and has an air pressure water system with hot and cold water throughout the building. There is a well-equipped kitchen, large dining room, twenty small individual Sunday School rooms and a rest room where the little children are cared for during the church service. The church has about 300 members, and the average attendance at the morning service is about 350, and at the evening services about 200.

This township is remarkable in that farmers when they retire, instead of moving to town, buy a little acreage near the church and school and settle down there. Along the country road, one will see a row of fine, modern homes, comparing favorably with any in a city, but it is in no sense a town, since there are no stores or places of business. It is simply a little country community. The teachers in the school never have trouble finding boarding places, because the homes are always open to them. The story of these other features of Orange township community life is told here, because it shows what can be accomplished in connection with a consolidated school.

Readers who would like to know just how good a village school may be are invited to take a little trip with us to the other side of Waterloo, Iowa, and visit the consolidated school in the village of Jesup. It is an unusually fine building, the total cost of which, including building, ground, and equipment was \$110,000. Here there are about 400 pupils in attendance, half coming from the country and half from the village. Approximately forty-eight sections are embraced in this consolidation and eleven one-room schools were abandoned.

The school grounds embrace approximately eight acres, furnishing a splendid setting of grass and trees for the school building. The building itself has an extreme length of 159 feet, and a depth of 98 feet. A very noticeable feature is the wide corridors, approximately sixteen feet wide. The building has three floors, the lowest floor being nearly level with the ground. The first floor takes care of the two lower grades, the manual training department, the gymnasium, the shower baths and locker rooms, and a lunch room off of the gymnasium. On the main floor are grade rooms, and quarters for the agricultural department and sewing room. On the third floor is a model housekeeping suite consisting of kitchen, dining room and bedroom. There is a tile bathroom off of the bedroom. The dining room has a fireplace in it. The kitchen is equipped with a large gas range and a built-in refrigerator. There is also a dumbwaiter running to the lowest floor so that some things may be cooked upstairs and sent down to the lunch room. The idea here is to give girls practical experience in keeping up a home of their own. On this floor is also a suite of rooms for the various science departments. There are also four recitation rooms on this floor. The school is provided with a good auditorium, opening out into the corridors, and as many as 650 people have been accommodated at one time.

In fact, one might say that this school building is equipped as well as any city building in every particular. There are telephones connecting the office with every room, a large vacuum cleaning plant in the basement, and a clock system with clocks in every room operated by one central clock. Outside the building there is a covered driveway so that the children can be unloaded from the busses in stormy weather without getting wet.

Cost of Running Schools

Professor Macy Campbell of the Iowa State Teachers' College at Cedar Falls, completed a very interesting study of the Orange township and the Jesup schools just mentioned. He first found that the cost of one hour of schooling under the immediate direction of a teacher in the 100 rural schools of Black Hawk county was 27 cents per

pupil per hour. In the Orange township school the cost was 18 cents per pupil per hour, and the Jesup school 24 cents. The tax levy for the running expenses of the Jesup school was 23 mills and for the Orange township 23.3 mills. The tax levy for the running expenses of the 100 one-room schools in that county average 11.6 mills, while the levy for the Waterloo city school was 32.2 mills. Consequently it will be seen that the consolidated schools cost more money than the one-room school, but are really cheaper when one takes into consideration what one gets for his money. Even at that, the country people get off with a smaller tax than in the city. If a farmer was offered twenty acres of stump-covered, marshy land for \$1000 and twenty acres of the best land in the world for \$2000, he would probably buy the latter, and call it a bargain. The same thing is true with schools, and Iowa farmers seem to be finding it out.

However, just because the schools we have described are elaborate and represent a good-sized investment, it does not necessarily follow that all consolidated schools have to be large and imposing buildings. There are a number of splendid examples of country schools in the state of Iowa where good types of brick buildings have been erected in the open country at a cost of \$20,000 to \$25,000. These schools are especially desirable where it is not advisable to tie up a large amount of money. We shall visit two such schools.

Five miles north of the town of Alta, Iowa, is the Fairview consolidated school. Buena Vista county, in which this school is located, has numerous splendid consolidated schools, and this

A Country School near Alta, Iowa, Where a Winter Course is Conducted for Farmers

school is only representative of number of others. In fact, approximately three-fourths of this county is consolidated. The Fairview school is a good type of small open-country consolidated school. Thirty-four sections are embraced in the new district and ten or eleven schools were abandoned in 1915 when this school was built. There are approximately 100 students enrolled in the school and about a fifth of these are in the high school. The building, a small two-story structure, cost about \$25,000. On the first floor is a large assembly room, domestic science room, and rooms for manual training and agriculture. On the second floor are five classrooms. The building is heated with steam and a pressure water system is provided. Near the school is an eight-room modern home provided for the five teachers free of charge. The expenses of running this school are between \$12,000 and \$15,000 a year. The cost of operating the seven bus routes is between \$650 and \$700 a month.

A unique feature of this school is a three months' short course in the winter for farmers and farm boys who have left school and desire to do some extra work during the winter months. During one winter, for instance, a week was devoted to traction engines, another week to farm accounts, another to stock feeding, and still another week to electric wiring. Perhaps a week other week be devoted to veterinary medicine. Sometimes a man is hired for the short course, but last year an instructor was sent from the Iowa State College for each week of the course.

Another good open-country consolidated school in Iowa is the Okoboji consolidated school near

Milford. This school has about 160 pupils, with a third of them in the high school. The cost of this school was \$25,000 and the cost of maintenance per year is about \$12,500. A unique feature in connection with this school was the moving in of two of the old school houses to serve—after being remodeled—as homes for the teachers and janitor.

In Iowa a consolidated school district must have sixteen sections. One-third of the voters in the proposed district may file a petition with the county superintendent asking for the consolidation. Objections may also be filed with the same officer. Those finding fault with the county superintendent may make an appeal to the county board of education. The law then provides that an election shall be called after the preliminaries have been decided upon. Village and country people vote separately and if a majority vote is not secured in both village and country, the consolidation cannot take place. Of course, this applies only where it is proposed to consolidate with a village.

Iowa's record with the consolidated school shows what can be accomplished when the people really decide that they want better schools. These new consolidated schools in the villages and open country of Iowa today resemble the big city high schools that a few years ago were pointed out as being the model schools of the nation. In fact, it would not seem strange that in the future some of the consolidated schools will eclipse some of the consolidated schools as far as the school plants are concerned. Today one finds many of the school buildings far in advance of those in any neighboring city.

"Subsidizing the Rural School," another article by Mr. Crawford, will appear in an early issue. This article will deal especially with the consolidated schools in Minnesota and the way in which state funds are made available for these schools.

FARM LABOR—A SOCIAL SURVEY

(Continued from Last Week.)

Many farmers seemed to feel it necessary to scatter tenant houses in the far corners of their farm in order to prevent disturbances among the various families. This point was investigated thoroughly and found to be without foundation. It is against the natural instinct of people to live in an isolated locality and away from other people. The ideal plan for tenant houses would seem to be to have them in fairly close proximity along a road. Front yards should be provided so that a lawn or ornamental shrubs could be set out. Sufficient room should be left between houses so that each family could have a garden and enough backyard to have their own poultry. With houses arranged in close proximity, the cost of installing running water, lighting, and sewer systems would be greatly reduced if this was contemplated. A certain pride in the appearance of a house would be stimulated between the various families by such an arrangement. It is rather doubtful whether the two-family house is suitable as it does not provide for enough privacy. There seems to be no good reason why with but small additional cost the bungalow type of tenant houses could not be used instead of the two-story type. This would be more attractive in appearance and more convenient. A heating system which would heat the bedrooms in winter should be given serious consideration. If running water is installed and bathing facilities considered, the recommendation would be that a shower bath be used in preference to tubs. The shower bath is coming into

Note 2—This paragraph sets up a worthy standard toward which we may work. Many farmers will have to provide for themselves the conveniences mentioned before they are in a position to provide them for the tenants. Shower baths may be all that is claimed for them where laborers are concerned, but most would prefer tubs for family use.

(Continued on Page 24).

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

DOES IT PAY TO KEEP MANURE UNDER COVER?

Much has been said in our agricultural books and farm papers about the importance of protecting manure against rain. We are told that manure which is not sheltered is apt to lose a large part of its soluble potash and nitrogen, which are carried away in the liquid that runs off from the manure heap; on the contrary, where manure is kept under cover, these losses are prevented. It is just as true that even where manure is kept under cover the loss of ammonia cannot be entirely prevented. The question, therefore, arises whether the saving which is accomplished by keeping manure in covered barnyards or in covered manure pits would compensate the farmer for the cost of sheltering the manure. The answer to this question may be found in some of the results recently obtained at the Experiment Station at Rothamsted, England, and also on Lord Elvedon's farm at Woking, England.

The land at Rothamsted is a heavy clay, while that at Woking is sandy. The experiments in question involved the keeping of equal amounts of manure under cover on the one hand and in the open on the other. After a certain length of time, these different lots of manure were applied to equal areas of land and potatoes and wheat grown at Rothamsted and wheat alone at Woking. It is reported that, from the equal quantities of manure kept under cover and in the open, potatoes showed an increase of 7 hundredweights per acre and wheat 5 bushels per acre at Rothamsted from the sheltered manure. At Woking the manure that had been kept under cover produced 2 bushels per acre more of grain than did the wheat which had received an application of manure that had been kept in the open. Similar experiments have also been carried out in Ireland. In this case two heaps were made up of about the same weight. One was kept under a shed and the other was exposed to the weather. When the time came to apply this manure, equal quantities of the two lots were weighed off and spread on equal areas of land at the rate of 15 tons per acre in each case. Potatoes were planted on the land so treated and in due time the crop was harvested and weighed. The results showed that the manure that had been kept under cover produced 9 tons and 14½ hundredweights per acre, while the manure that had been exposed to the weather produced 7 tons and 14½ hundredweights per acre. In other words, there was a difference in favor of the manure that had been kept under cover of two tons per acre, which is equivalent to about 67 bushels. It is pointed out in connection with these experiments that the real superiority of the covered manure is even greater than indicated by the differences in yield, since the manure which had been kept under cover lost less weight than the manure which had been kept in the open. In other words, the sheltered manure was more ton for ton than the exposed manure and the latter, in addition, had shrunk in weight much more than had the sheltered manure. In spite of much that has been said and written on the subject, many farmers in this country still fail to exercise sufficient care in protecting their manure heaps against leaching. The losses of plant-food, particularly potash and nitrogen are, in the aggregate, very large.

Some folks never borrow trouble—they just borrow \$2 and fergit it.—Kin Hubbard.

TILLING DAMP SOIL

I have about 10 acres of low wet land which is of very stiff texture, some a black soil, and part what is known here as white oak. It was, previous to plowing last fall, in timothy, but most part sage grass and weeds. It has not been tilled for about five years. The land is very poor where the white oak is. We have ditched and drained it as best we can but it is quite wet. How can I treat this to get it in timothy and clover for hay crop? Would you advise lime and how much per acre? It was plowed in October and I will have to disc it well before planting to corn. Would you apply fertilizer and what formula. Some say it will not grow anything but grass. If possible, I would like to get this land in a condition so I can till it the same as my other soil. Would coal ashes help to loosen it? Do you think I can get a fair crop of corn this year? D. M. M., Kent Co. Del.

Mr. D. M. M., Dover, Del.—From your description, it would seem that it would be very difficult to grow consistently good crops of corn on a large part of your field. If the land is plowed in the preceding fall and a good fourth established by the middle of May, a good corn crop could possibly be grown if the rainfall during the summer is below the average.

If the installation of a system of tile drains is not practicable, it might be possible to put in more open ditches and establish a good fall. After this is done, it would be well to apply a generous quantity of lime, preferably burned and slaked lime, which would be more efficient than ground limestone on land of this type. It would be worth while to use an equivalent of about one and one-half tons of freshly burned lime per acre. This may be air-slaked or water-slaked before application as may seem most convenient. There would be no objection to using some coal ashes with the lime, since the coal ashes would tend to open up the land and improve the texture. There is,

of soda in the following spring at the rate of 100 pounds per acre.

If it is your plan to try a crop of corn next spring, the land should be prepared as suggested for the soybeans except that a complete fertilizer should be used. A 4-8-3 or a 4-10-3 fertilizer, used at the rate of 400 to 500 pounds per acre, would answer your purpose.

MANAGEMENT OF SANDY SOIL

I am moving onto a farm near Grenloch, Camden Co., New Jersey, and as I have had no experience with sandy soil such as is found in that section I would be glad if you could give me some help. My main crops will be corn, oats, timothy, clover and alfalfa. The farm has been producing only fair crops and I would like to bring it up by the use of commercial fertilizers and lime if they are needed. Will you please advise me as to their use? I will not be keeping cattle to any great extent.—F. H., Bucks Co. Pa.

F. H., Bucks Co., Pa.—The ability to maintain your land in a fertile condition will depend not alone on the proper use of commercial fertilizers, but also on the proper adjustment of your crop rotations. One of the common rotations in general farming areas is corn, oats, wheat, timothy and clover. However, this rotation would not be entirely suitable for the land located in the vicinity of Grenloch. A more logical rotation would be corn, potatoes and alfalfa for two or three years; or it might be corn, potatoes, timothy and clover. An early variety of potatoes, like Irish Cobbler, is a popular type in that territory. Hence, the crop is removed early enough to allow the seeding down of the clover and timothy mixtures in the late summer. It is also possible to grow in that section the late varieties of potatoes, like Redskins or Superbs. These are usually planted between July 15th and August 1st. It would be feasible in some years to precede the late potato crop with early peas. The late potatoes are harvested usually in November. In occasional years it would pay to grow tomatoes on part of the area after the corn. At present, however, tomatoes are not a paying crop.

In order to assure the proper maintenance of organic matter in the soil, it would be desirable to depend on crimson clover or vetch, or, preferably, a mixture of crimson clover, alfalfa and vetch to be sown as a cover crop in the corn. This could then be plowed under in the following spring for the potatoes. With a cover crop after the corn and with the land kept in grass for two or three years, it should be possible to maintain the humus content

and to depend on commercial fertilizers alone for maintaining the land in a productive condition. A 3-8-5 fertilizer could be used for the corn at the rate of 400 to 500 pounds per acre. For potatoes a larger proportion of nitrogen in the fertilizer would be necessary—possibly, as much as five per cent ammonia. A 5-10-5 fertilizer could be used to advantage for the potato crop at the rate of 1400 to 1800 pounds per acre. It would be desirable to use lime in order to assure a good growth of legumes. However, lime will have to be used carefully if potatoes are included in the rotation, since the use of lime encourages the growth of the potato scab fungus, and therefore, reduces the value of the potato crop. If potatoes are not made one of the principal crops, lime should be used generously. Applications of two to two and a half tons of ground limestone per acre every five or six years should give profitable returns. It should help to grow an abundance of forage, particularly of legumes including, aside from the legumes mentioned, soybeans, alsike clover and possibly also sweet clover.

A manure spreader saves time, labor and manure values, especially if the manure is spread as it is produced.

VOLUME 49 NUMBER 10

OUR JOB is to serve our readers. Whenever you are
puzzled, write to us and we will help you if we can.
—The Editors

No man is born into the world whose work is not
born with him; there is always work and tools to
work with, for those who will, and blessed are
the horny hands of toil—Lowell.

Daylight Saving

WHEN WE BEGAN the fight against the passage of a daylight-saving law we took it for granted that all town and city people were for it and that only farmers were against it. We have learned, however, that a great many workmen do not favor it and are as pronounced in their opposition as are farmers. The opposition to the passage of the bill is progressing very satisfactorily and the chances for defeating it look bright at this time. It is too early, however, to cease working against it. Every farmer organization and every individual farmer who has not already lent his name in opposition should write to his representative and senator at Harrisburg at once. If you do not know the name of your representative, send your protest to Hon. Charles G. Jordan, House of Representatives, Harrisburg, Pa. We have placed in his hands the protests of over 10,000 Pennsylvania farmers who filled up and returned the blank published in our January 29 issue.

The senate of New Jersey has already passed a daylight-saving bill by a large majority but at the time this is written the house has not acted upon it. We have received and presented the protests of New Jersey farmers and hope that enough pressure will be brought to bear to defeat its enactment in that state.

A Commendable Milk Bill

A BILL to regulate the sale of condensed or evaporated milk by establishing a minimum content of milk solids and milk fat was introduced into the Pennsylvania Legislature by Mr. Cook. The bill was prepared under the direction of the Pennsylvania State Dairy Council and is known as House Bill No. 497.

It is for the protection of the public health and the dairy interests of the state that the prohibition of the manufacture and sale of compounds of skimmed milk and vegetable oils, to be used in the place of cream, condensed or evaporated milk, or in the manufacture of ice cream and other dairy products.

Actively supporting this bill, in addition to the Pennsylvania Dairy Council, are the Interstate Milk Producers' Association, the Dairywomen's Co-operative Sales Company, the Dairywomen's League, Pennsylvania State Grange, Pennsylvania Ice Cream Makers' Association, Philadelphia Milk Exchange, the Pittsburgh Milk Dealers' Association

and the Philadelphia Inter-State Dairy Council.

The Legislative Committee of the State Federation of Labor is in favor of the bill; various officials in the State Department of Agriculture, the State Department of Education and the State Department of Health have had placed before them the facts relating to this question and are unqualified in approving the proposed legislation.

Urge your legislators to support the measure on the floor.

Pennsylvania Farmer

tion and the Philadelphia Inter-State Dairy Council.

The Legislative Committee of the State Federation of Labor is in favor of the bill; various officials in the State Department of Agriculture, the State Department of Education and the State Department of Health have had placed before them the facts relating to this question and are unqualified in approving the proposed legislation.

Urge your legislators to support the measure on the floor.

Fertilizer Prices

NO OTHER question concerning farm production problems has caused as much discussion the past few weeks as has that of fertilizer prices. The prices named in December at the time farmers were suffering most from price declines seemed altogether out of proportion to the prices of farm products and the fertilizer trade stood still. Since that time there has been a decided drop in practically all lines of fertilizers and the reports are now that nearly normal sales are being made.

This is a most encouraging as well as a fortunate trend because it indicates normal planting and insures an adequate supply of plant food for the crops.

A few of our writers have named prices of fertilizers and fertilizing materials in their correspondence and this has brought a flood of letters asking where goods can be procured at the prices named. We are not in a position to recommend any particular firm or goods in any line, but we believe that all the manufacturers will make practically similar prices under similar conditions. It must be remembered that the low prices named are for carload lots at loading point and for spot cash. Buyers cannot expect to get these low prices for small quantities or when they buy on credit.

Information Wanted

WE HAVE inquiries for information on setting and sharpening all kinds of saws; also, for organizing a farmers' fire fighting force—a plan by which neighboring farmers may be equipped and called together for fighting fires. We would be glad to print an article on the first subject if written by an experienced saw dresser, and on the latter subject if written by one who has had experience in such an organization.

Our Washington Letter

Enough of the 1920 census returns have been made public to indicate that this census is a vast improvement over those of preceding decades, especially in the collection of valuable agricultural and live stock information. It is believed that the returns from the census on purebred live stock will be useful in developing a larger interest in the improvement of farm animals by the use of better breeding stock.

The census returns on purebred stock have been an agreeable surprise to officials of the Department of Agriculture, who are especially concerned in live stock improvement. They evidently did not realize the extent of the purebred stock industry and the rapidity of its development in recent years.

The figures compiled in Ohio, Michigan and New Hampshire show a total of 19,135 Holstein bulls, and 7,896 Jersey bulls. Shorthorns lead the beef breeds with 23,663 bulls. Herefords come next with 10,864 bulls.

Of the sheep breeds, Shropshires lead in nearly all the states reporting. In Ohio, as would naturally be expected, the Merinos are most numerous. On 1,291 Ohio farms there are 24,170 purebred Merino sheep, more than all the other breeds combined and more than all the purebred sheep in Michigan.

The Poland Chinas and Duroc Jerseys are close competitors and are the predominating breeds of hogs in ten states. Durocs are first in Michigan, while Poland Chinas lead in Ohio and Indiana. In Indiana the census indicates that the Spotted Poland Chinas are making rapid progress in gaining popular favor.

It is interesting to note that horses stand at the foot of the column in percentage of farms on which purebreds are kept. While in all the ten states more than ten per cent of the farms report some kind of purebred animals, only two states, Ohio and Indiana report above one per cent of the farms having purebred horses. The Percherons stand highest in numbers with Belgians second in Michigan, Ohio and Indiana.

March 5, 1921.

Figures showing the standing of the purebred live stock industry in the remaining thirty-eight states, it is said, will not be available until next fall, the work being held up a lack of appropriations to carry it on expeditiously. It is expected, however, that when all the statistics on purebred stock are available, they will be highly useful to breeders' associations and all others who are interested in the improvement of our live stock.

During the closing days of the Sixty-sixth Congress the farm organizations' Washington representatives made persistent efforts to secure action on the packer bill and other important measures that have been long pending in Congress.

As a final effort to get the House to vote on the packer bill, they went before Majority Leader Mondell, arguing that with only two or three other bills of importance remaining on the calendar the packer bill should have a preferred position. Representative Mondell declined to make the move to bring the measure before the House. Representative Campbell of Kansas, chairman of the Rules Committee, was appealed to with the hope that a special rule might be made which would allow the House to vote on the bill. This he was unwilling or unable to do.

By these efforts the farm organization leaders have succeeded in placing the responsibility for the present status of packer legislation squarely upon the Steering and Rules Committees of the House.

The American Farm Bureau Federation and National Grange representatives are receiving many protests from the Northwestern dairy interests and the California poultry raisers against the provision in the cold storage act which requires perishable commodities to be marked "cold storage" if on the road more than ten days. The Petaluma, California, poultrymen sent telegrams saying that their industry would be ruined unless the time was extended to thirty days. It is probable that shippers of poultry products and butter from some of the Middle West and Rocky Mountain states will be similarly effected by this measure. It is predicted that a change in the time allowed in transportation to thirty days will be made early in the next session of Congress. It is impossible to get a bill thru Congress satisfactory to all the producers.

Since the death of David Lubin this government has been unable to secure the services of a competent representative at the International Institute of Agriculture in Rome, because of the insufficient appropriation for salary and expenses. —Elmer E. Reynolds.

Whether they knew they would be making deficits or not has been much discussed, but the disposition is to appropriate what is needed this time around and not put the next session in a hole. Then, too, the state has had to meet some unusual charges for office accommodations because the present Capitol is too small to hold the departments and bureaus and highly indorsed the movement. Hon. Josiah C. Wolcott, senior senator of Delaware, gladly accepted membership in the organization. He spoke highly of the work done by the American Farm Bureau to the U. S. Senate which led to postponement of the Nolan Land Tax bill which proposed to tax real estate 1 per cent value above an appraisal of \$10,000.

Cost of the Insane.—One of the charges which have made legislators pause in addition to the discovery that the teachers retirement system will take a couple of millions and the next teachers salary bill a couple of millions more is that the state is going to require something like \$8,000,000 or \$7,000,000 for their maintenance and care. There is a bill in hand to increase the allowance for these unfortunate and with the growth of population this situation is bound to become a still greater problem. The insane may yet be the cause of a radical change in state policy.—Hamilton.

NEW YORK LETTER

New York's "Poor Richard."—Dec. 17, Briston Adams, head of publicity work at our state college, was called to Washington to compile an agricultural almanac for Uncle Sam. Which he did in record time for a governmental document of that sort. He was chosen because his "Uncle Ah" farm sayings have attracted notice, and approval. He did the work of the book from cover to cover, including drawings. It is published as Farmer's Bulletin No. 1202, and every farmer will find it interesting and helpful.

Indians Carry Agricultural Instruction Home.—Nine Iroquois Indian young men and girls who have been taking winter short courses at the state college, were entertained at Farmer's Week at a banquet, and evidenced much appreciation of the help the college is giving them. They will encourage a program on the reservations that will mean better agriculture. They put on an Indian play-

let at the Kermis given one evening during Farmer's Week. The theme was "Welcome Palefaces." The chief play of Farmer's Week, "The One Way Out," a \$200 prize play written by a student, was of real merit in itself, and showed the great influence the present farm loan system has on rural life.

Cho-Cho Teaches Children.—Cho-Cho, the only clown on Uncle Sam's payroll, instructed over 1000 Ithaca children at Farmer's Week as to what they should eat in order to become strong and robust, and is in Oneida, Oswego and other cities of the state this week. His message is a big one and he knows how to put it across. Some of his hearers would suggest, however, that in spreading the ideal sandwich for children, that the use of real butter, instead of peanut butter, would result in far better health conditions for both children and adults. This seemed the only flaw in his forceful tale.

New Home Bureaus.—Two new home bureaus in Lewis and Herkimer counties, have added 1000 members to the state roll. Applications have been made by other counties, and there are 31 home bureaus now in a thriving condition, with a membership of 17,000 to 18,000.

DELAWARE NOTES

The state-wide drive for membership in the County Farm Bureau, State Federation and American Farm Bureau Federation is continuing successfully with Kent County over the top and New Castle and Sussex nearly over the top. From three to eight farmer solicitors have solicited about 1000 farmers in Kent County and 60 per cent have joined the Farm Bureau on a three-year basis.

W. V. Cosden, of Dover, chairman of the state organization committee, says that at least 5000 farmers should become members of the county, state and national farm bureau organizations in Delaware by the latter part of the first week in March. Governor Denny in his first act, after taking up his official duties, joined the Kent County Farm Bureau and highly indorsed the movement. Hon. Josiah C. Wolcott, senior senator of Delaware, gladly accepted membership in the organization. He spoke highly of the work done by the American Farm Bureau to the U. S. Senate which led to postponement of the Nolan Land Tax bill which proposed to tax real estate 1 per cent value above an appraisal of \$10,000.

It is feared that the recent snow and sleet storm has done serious damage to the fruit trees in this section. The mild weather had caused some of the trees to start to bud and local orchardists believe the buds have been frozen by the coating of ice on the tree limbs.—E. W. M.

NEW JERSEY NEWS

Fight Daylight Saving.—Vigorous opposition is to be recorded against the passage of the Eldridge daylight saving bill, providing for the changing of the clock one hour from the last Sunday in April to the last Sunday in September, before it is acted upon in the Senate. It is by no means a popular piece of legislation here among persons directly and indirectly interested in the work of the agriculturists of New Jersey and in sympathy with their efforts to prevent the injection of anything that will cause a decrease in the production of foodstuffs. A fight worthy of much admiration was put up in the House of Assembly by members of that branch of the Legislature from the rural sections of the state where great farming interests are located, but the bill was passed by a big vote that came from the assemblymen from the populous centers where the new plan is wanted. Assemblyman Emory Roberts, of Burlington county, where he is an extensive fruit grower and actively identified with agriculturists in the promotion of movements of a most worthy character, was one of the principal spokesmen against the measure. He emphatically declared it would vitally interfere with the efforts of the farmers to get on their feet after striving to overcome wartime problems.—Kelly, Trenton.

Henry C. Wallace, Secretary of Agriculture

At the time this paper goes to press there seems to be no doubt that Henry C. Wallace of Iowa, will be named to fill the office of Secretary of Agriculture in President Harding's Cabinet. Mr. Wallace is editor and publisher of Wallace's Farmer and has been prominently identified with agricultural interests. He is a farmer and livestock breeder, member of United States Livestock Industry Committee, Secretary of Corn Belt Meat Producers' Association, and has been long interested in the Young Men's Christian Association.

HARRISBURG LETTER

Down to Brass Tacks.—The Legislature of Pennsylvania has started out to find out what money it must appropriate to meet obligations which have grown up with the years. From present indications it is going to cut its coat according to the cloth instead of leaving the trimming work to be done by the Governor. This is the most important matter that has arisen out of the recess with its various reports of alliances and skirmishes and pilgrimages. It seems to be due to a realization that the state will have to get along with very little more than the revenue appropriated in 1919 and that there is a possibility of it going lower; that there will be some hard fighting before any new revenue bills are passed and it may be a couple of years before the state gets the benefit any way owing to legal tests which are sure to be made; that the state administration is not inclined to reduce the list of employees or the state payroll to any extent and that the payroll will have to meet some pretty steep deficits. Then, too, there is a very general idea among members of the Legislature that there is going to be some accounting to be done after this session and they want to get it over as soon as possible. Word has gone out to the heads of departments of the state government to send in their budgets to the committee in charge of the general bill and to the men in charge of teachers retirement and teachers salary matters to figure out what is needed so that there will be no deficiencies to meet next session. One of the greatest troubles has been that the people in charge of the appropriations in 1919 did not provide the money needed to meet all requirements. Whether they knew they would be making deficits or not has been much discussed, but the disposition is to appropriate what is needed this time around and not put the next session in a hole. Then, too, the state has had to meet some unusual charges for office accommodations because the present Capitol is too small to hold the departments and bureaus and highly indorsed the movement. Hon. Josiah C. Wolcott, senior senator of Delaware, gladly accepted membership in the organization. He spoke highly of the work done by the American Farm Bureau to the U. S. Dairy Rations at Present Prices

By Prof. A. L. BEAM

DURING the last few years great progress has been made in the development of balanced rations and the necessary requirements for milk production and body maintenance of dairy cows. Stress has been laid upon the necessity of combining in proper amounts protein, carbohydrates and fat in the cows ration. More recently it has been found that the ration should also contain vitamins and mineral matter. Both of these are abundantly available in the certain roughages and grain feeds. Yet when we compare the mineral matter or

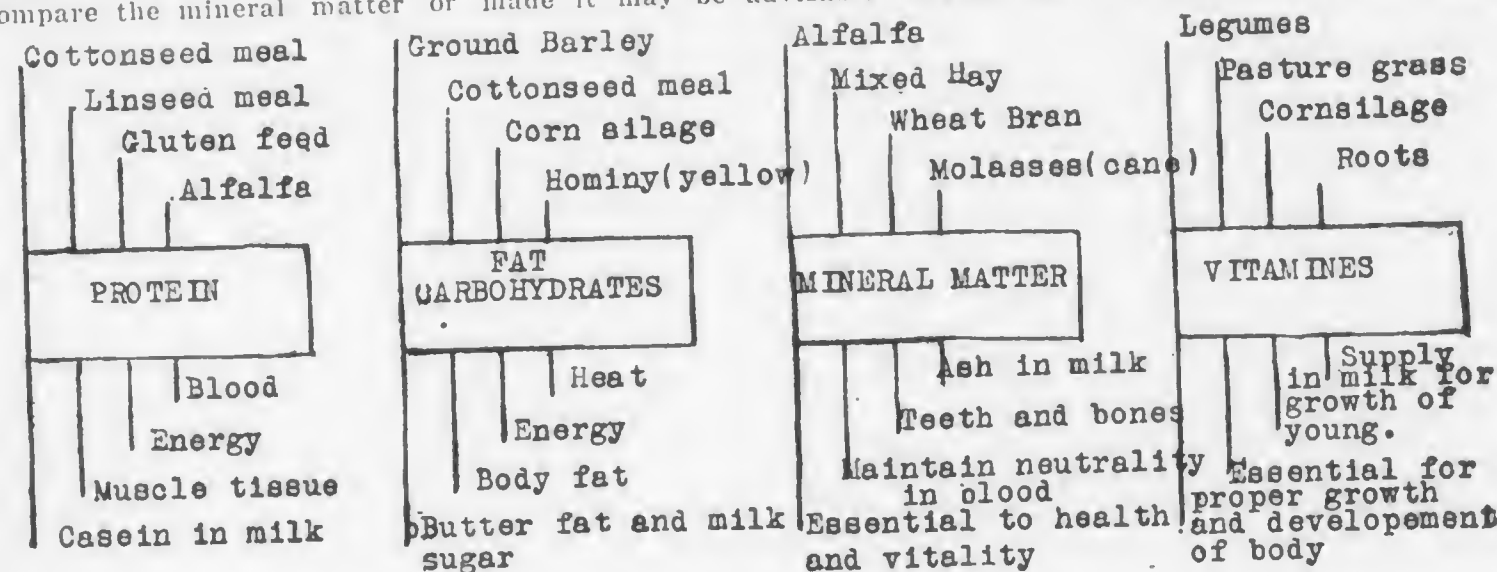

ed indicate that with the best of selection some heavy producers must have their ration supplemented with mineral matter in order to maintain their production.

With the present trend of downward prices on feeds a possible saving may be made in dairy rations by substituting feeds which are now lower than they were when the ration was first made up. In most cases, where a feed is too high priced for the nutrients it contains and no substitution can be economically made it may be advisable to elim-

all the sources or all of the various uses or functions in the process of converting food into milk or body requirements. However, some of the economical sources, together with the more important of the final uses are given.

Since a choice of the source of the various nutrients is possible it can be based largely on market prices; not market prices on tons of feed alone but the cost of the digestible true protein and net energy content. The table below gives the digestible protein and net energy content of the more common feeds, the price per ton, the price per 100 pounds, the cost of 100 pounds of digestible true protein and the cost of 100 therms of net energy.

From this table it is possible to select those feeds which most economically furnish digestible protein and net energy. Comparing these results with the table which might be made with prices six months ago shows that our choice of feeds now may be entirely different from what

like as it is more commonly called, which a cow receives in her ration, with the amount secreted in the milk produced and that which is needed for the proper growth and maintenance of her body and as well as that of the foetus we find that in many cases the animal receives an inadequate supply. Deficiency is especially evident with regard to those cows which are giving large amounts of milk. To remedy this without making use of commercial preparations, care should be used in the choice of feeds and even then experiments which are at present being conducted

inate it from the ration even though this lessens the variety of the grain mixture which is essential to a well balanced ration. This, of course depends upon the price at which dairy products sell on the market as compared with the cost of feeding stuffs. The accompanying diagram gives in the center of the squares the essential requirements for the production of milk and the proper growth and development of the dairy cow. Above each figure are sources of these requirements while below is listed the uses to which they are put. No attempt has been made to list either

it would have been at the beginning of winter. For example the present low price of cottonseed meal makes it one of the cheapest sources of both protein and net energy. Again it shows that wheat bran, altho containing fewer nutrients than standard middlings is priced higher on the market. The same difference is noted in the price of oats and barley. In this table altho these prices may not hold true in all localities it also shows the high cost of roughages as compared with the present market price of grain.

The attempt has been made to show that certain conditions or factors which determined the dairy ration a short time ago have changed now so that the feeder who studies the present situation of feed prices has greater chances of making out on the present price of milk than the feeder who pays little attention to market conditions of feeding stuffs.

ANNUAL REPORT OF COW TESTING ASSOCIATION

Kenneth S. Bailey, tester for the Clinton Cow Testing Association, Clinton Co., Pa., has written the following letter in reference to the work of the organization he represents:

Due to the fact that many people are not familiar with the principles of this work, the following will give an explanation of the same.

An association is simply an organization of farmers who unite for the purpose of employing a trained man to weigh and test milk of each cow in the herds of the association at monthly intervals; also record the amounts of feed and roughage she is consuming. Thus a record of every cow in the herd is obtained at the end of the year without any trouble on the part of the individual dairy-

Behind Your Crop—

A Crop Investment Policy

"Some corn, that, Mr. Mason," remarked County Agent Jackson, casting an admiring glance at the straight, clean rows.

"Yes, it ought to shuck out a hundred bushels to the acre—it nothing happens. But drought or frost may catch it yet."

"Why take a chance, when you can insure it? Better put a crop investment policy behind your crop. It takes the risk out of farming."

The Home Insurance Company, New York, is now prepared to issue a crop investment insurance policy on field and orchard crops. This policy covers the cost of labor, of men and teams, the expense of operating tractors and other labor-saving machinery, also the outlay for seed, lime, fertilizer, spray materials, etc. It insures you against the loss of your investment through frost, winterkill, drought, excessive moisture, flood, insects and plant diseases.

This Company, established in 1853, has long protected farmers from loss through fire, lightning, windstorm and hail. It has paid more than \$200,000,000 to policy holders. Its record of fair dealing for nearly 70 years assures you of prompt and satisfactory adjustment.

Write for particulars concerning crop investment insurance and the name of the nearest Home agent. Take the risk out of farming.

Get the Full Value Out of Your Soil

Thorough cultivation, with a Planet Jr., by breaking up and pulverizing the ground, letting in warmth and air, and keeping in moisture, doubles the natural fertility of the soil, doubles the effectiveness of manures and fertilizers, because these lie idle in the ground unless fed to the crops by cultivation.

No. 12 Planet Jr. Double and Single Wheel Hoe either straddles the rows or goes between them, as desired. Equipped with plows, hoes, cultivator teeth and leaf lifters, it is specially recommended for home or market gardens.

Planet Jr. Cultivators because of their scientific construction, break up and turn the ground in the way best suited to crop growth. They feed the plants, producing much larger and better growth. They can be set to uproot, or to cut off below the ground, dock, bindweed and other deep rooting weeds. Whatever form of cultivating you need done, there is a Planet Jr. to do it the best way.

No. 90 Planet Jr. Twelve-tooth Harrow, Cultivator and Pulverizer is a great time and labor-saver for farmers and market gardeners, beet and tobacco growers. Leaves the soil in perfect condition. Write for our free illustrated catalog, describing and giving directions for the use of all Planet Jr. implements.

Dairying is most profitable

PRICES for dairy products have held firmly, while the cost of feed has been greatly reduced. Because of this there is relatively more profit than ever in dairying, and many farmers are turning low-priced feed into high-priced butter-fat. An eminent dairy authority says that you can make corn worth \$2 to \$3 a bushel by feeding it to good cows.

And De Laval Cream Separators have done more than any other factor to place the dairy industry on such a firm and profitable basis. They save cream, time and money twice a day, every day in the year. They produce steady cash income. They have made the market accessible, even though you live 500 miles from a creamery. They keep the skim-milk on the farm to produce another crop of calves, hogs and poultry. They are made so well that 20 to 30 years' service from a De Laval is not unusual. Over 2,500,000 are in use in all parts of the world.

You need a De Laval more than ever. There is a De Laval agent near you—see him.

thus compared it with that of the supervisor near the close.

A purebred sire is one of the best paying investments on the farm. With such a sire at the head of the herd, the owner is most generally cited as one of the most progressive farmers. The dairy men of this association readily could see the good points in such and ousted the scrub bull by replacing with twelve purebreds, thus with five which were in use we had at the close seventeen owned, and five other members made use of their neighbors.

Five silos were erected and four of the members installed drinking cups which was a paying proposition as stated by one of the men. "I would not have the cups removed twice what it cost to buy them and the expense of installing." Two milking machines were put in use and one electric light plant. Eighty-six cows culled and sold as unprofitable.

Another good feature experienced by the dairymen was the purchasing of feeds co-operatively, especially last fall when the market kept soaring to higher elevations. One herd of registered stock was bought and distributed among the members.

Last June the members and their friends numbering about forty people, accompanied by the tester visited several of the up-to-date dairy farms in Susquehanna County. This trip was not only very enjoyable, but very educational.

As for the final conclusion we wish to emphasize strongly that continued testing is necessary for progress. The dairyman who tests for one year only is not looking to the future. Cow testing work gives a valuable breeding guide for the dairyman who wishes to build up his herd.

Unfortunately the dairyman who needs cow testing the most uses it the least. However, the records of the high producing herds show that the greater the production the more careful the culling of the "boarder cow."

At the present high prices for feed and labor a dairy herd must produce more than 6000 pounds of milk and 200 pounds of butterfat per cow annually to bring the owner a profit.

Greatness of production as provided by weighing and testing the milk is not the complete record of the greatness of the cow, for the question still remains as to the cost of production. And, after all, this is the vital question and the one that is growing in importance continually. It is rule that a cow which yields largely of milk and butterfat is the economical producer, but it often occurs that of two cows producing the same amounts of milk and butterfat in a given time, one of them does so at a less cost of feed. At the present time the difference in profits of the herds in this association is not so largely governed by the cost of feed as in the yield but as conditions change, land becomes higher in price, feeds and labor scarcer and more expensive this difference will widen.

Thus as a final close we wish to say twenty of the twenty-six members joined for the second year's work also more new members and hired the same supervisor.

Note—Owing to lack of space we have been unable to publish many of the interesting cow-testing reports submitted, but the above report has so many suggestive features about it that we gladly give it space.—Editor.

The owner of a scrub bull should have a leather medal—made from the bull's hide.

DAIRY SCHOOL FOR PASSAIC CO.

Arrangements have been completed by Harold E. Wettyn, county agricultural agent for Passaic County of New Jersey, for a six session school for the benefit of the milk producers, distributors, and persons interested in the handling and care of milk and dairy products, whereby the aid of a course of lectures, the salient and beneficial points may be brought out and thoroughly discussed.

This idea is the outcome of a successful school on bee culture and poultry husbandry, whereby the same method, the subjects were thoroughly and most interestingly covered, for the benefit of all who were able to get admission.

The school is under the supervision of the County Board of Agriculture, and the methods and ideas conveyed are the latest the national and individual boards have discovered by experimenting and investigation.

The bee school, as it has been aptly termed, was held in three sessions and was attended by a great number.

R. D. CANAN

Field Man for Jersey Breeders in Ohio, Indiana and Illinois

ber, while the poultry school had an attendance of nearly two thousand for an eight session period, which covered a term of two weeks.

The dairy school is to go for eight sessions and the length of time required will be two weeks and is to cover such subjects as "Building and Equipment," depicting the modern methods of sanitary construction and the proper equipment to maintain such products, "Feeding and Herd Management," depicting the proper methods of feeding for the maximum of production and managing of herds for the proper and healthy production of milk—"Care of Milk from Cow to Consumer," showing the proper methods for caring for the milk from the cow to the consumer's table and the most approved methods for caring for the carriers and containers.

At this point a change is made, and a lecture in the care of and the elimination of sickness prevalent to stock is brought up. A thorough discussion in "Tuberculosis Eradication" is given, in which all forms, causes and remedies are set forth. There is particular emphasis laid on this subject, as it means so much to the public and the dairy man.

The "Family Cow" is given due consideration and the subject is ably covered by a most thorough lecture. "Marketing Milk" is discussed and a very thorough treatise is given, whereby all the modern methods are set forth in the proper and sanitary way of handling and marketing milk, from the time it leaves the cow until it reaches its destination for consumption.

"A Trip to a Modern Milk Plant" is the last subject covered, and the ideas conveyed are modern to the last minute, telling how to handle and care for the dairy, barns, stock and equipment.

The foregoing is tentative and should the attendance come up to the other schools, the program will be made to cover more subjects and in general, made a very thorough course, for the betterment of dairy-men.

STATE HOLSTEIN ASSOCIATIONS TO SPEND \$85,000

Approximately \$85,000 will be spent during 1921 by various State Holstein Associations in the interests of their members to develop and promote the dairy business in their respective territories.

The national body of the Holstein-Friesian Association of America has put the real punch into the State Associations during the past year. The idea was conceived about a year and a half ago, by R. C. Pollock, of the Extension Service of the National Association.

Most state organizations lack only the funds to go ahead and develop within their own boundaries better business methods in improving their herds and disposing of their surplus stock.

With this in mind, several state organizations were interviewed and eagerly accepted the help of the National Association to organize. Nine states and one group of states are organized as a result, and have a paid secretary on the job who spends all of his time in the interests of members of his state or district organization. The states organized and doing business are: Minnesota, Iowa, Illinois, Missouri, Wisconsin, Michigan, Ohio, New York, New Jersey and the New England States.

Some of the organizations have been promoted on the straight membership fee; others on a per cow basis. The plan has been successful, however, no matter what basis or organization was adopted and means that during the coming year something in excess of \$85,000 will be spent in these ten states for the improvement of dairying, raising the standard of sales and offerings, adjustment of all controversies, selection of higher producing stock and cooperation in cleaning up of diseased herds and areas.

BRADFORD CO. COW TESTING ASSOCIATION

As June approaches, the increase in high producing cows in Bradford Co. Cow Testing Associations continue to show a greater number and for the month of January the reports give a nice increase over the previous month's records.

The Canton Association again leads with the greatest number of high producing cows while the Wyalusing Association has the highest individual. The Canton Association has one hundred and one cows that produced 40 pounds or more of butterfat. The Wyalusing is second with sixty-three, the Troy third with fifty-six, Laurel Hill and Rome are a tie for fourth place with thirty-three each and Towaunda-Wilmot fifth with twenty-eight.

Again the four highest producers are all purebreds. Three are registered Holsteins and one a registered Jersey. The highest cow is a registered Holstein owned by C. W. Newman of the Wyalusing Association. The second high cow is a Holstein.

"The test cup action is superior to anything else on the market." —ALVIN VOIGT.

Perfection Milks Just Like the Calf

IF you put your finger in a calf's mouth and then in the teat cup of the Perfection you won't feel a particle of difference. The gentle suction followed by a downward squeeze, followed by a period of rest is a perfect copy of the calf's action. Human hands can't duplicate the calf's milking.

Perfection's way is nature's way of milking. That's why it pleases the cow. This natural action is made possible by Perfection's downward squeeze, a patented feature not found in any other milker.

Whether you have grades or high priced pure bred's your cows will like it. Most owners tell us the milk flow increases when the Perfection is used.

Not only can you milk better with the Perfection but you can milk quicker and cheaper. One man with the Perfection does the work of three hand milkers. Here's a chance to save wages and be independent of hired help. Investigate this better way of milking.

How To Investigate

Write for your free copy of our book, "What the Dairyman Wants to Know." It answers every question about milking machines.

Why Milk By Hand? Cows prefer Perfection's natural action.

HORTICULTURE

Making Up a Seed Order

By R. W. De BAUN

MAKING up the seed order is no easy task. In fact it necessitates careful planning before we can decide upon the kind of vegetables we will plant; the varieties we believe will do best and the quantity of seed we will need of each crop to be planted.

In writing the names of our pet varieties, I realize that some experienced growers may be amused at some of the selections. However, I will state any reasons in most cases and not fear criticism.

For wax beans we use the Davis White Wax (3 pecks per acre). It bears a big crop of very beautiful waxy beans which attract the buyers. Furthermore, it at any time the market is down, the crop can be allowed to mature. The seeds are snow white and are excellent for home use.

The old standby in green beans is the Black Valentine. It is extremely hardy, a quick grower and can be planted very early. It yields heavily the first picking and it can be harvested very fast. Last summer two Italian women picked 42 bushels in one day and were done before six o'clock.

The Early Wonder beet has been our standby for years because it grows quickly; it is deep red, tender and delicious. The beets are perfectly round and the tops are attractively red and small so that they are easy to bunch and tie.

We do not go in for the extra early cabbage because it would conflict with early lettuce, strawberries and currants. Furthermore, during July and August we are heavy in early tomatoes, sweet corn and cantaloupes. During the month of September there is an opportunity to load cabbage conveniently before the fall crops of spinach, cauliflower and lettuce come on. For harvesting in September we use Market Gardeners No. 2 as it is a strong grower and produces large compact heads. Copenhagen market is wonderful when it grows right but with us it seems to be subject to disease and is uneven.

The Chantenay carrot is much more attractive than the Danvers Half Long which we used until recently. Snowball cauliflower is the universal standard sort.

Easy-blanching celery is a most valuable variety of recent introduction. It grows vigorously and is resistant to disease. It has a multitude of medium length, crisp, heavy stalks of delicious flavor. In fact it is rapidly replacing Golden Self-Blanching, Giant Pascal, White Plume, etc.

When it comes to sweet corn, it is a conundrum. First first early we use Simon's Early Wonder. At the same time (about April 20) we plant a field of Howling Mob or else Early Champion. All these varieties produce a good sized, deep-grained, well-filled ear. Simon's Early Wonder sweet corn will be ready a few days before the others and only one planting is made of it because it is not quite large enough for summer trade. However, the Early Champion and the Howling Mob are good sized. We use them for successive plantings be-

cause they can be planted closely and produce several thousand ears per acre. Stowell's Evergreen, Mammoth, Long Island, Beauty, etc., grow too large. The extra price received does not make up for the reduced yield and heavy hauling. Country Gentleman is delicious when young but it gets tough and stringy quickly. Golden Bantam is delicious but too small to give satisfaction commercially.

Another new variety of merit is the Jersey Pride cucumber. It is a selection from White Spine, but superior in every way. Furthermore, the undersize cucumbers make more desirable pickles than any other variety of cucumbers.

Black Beauty eggplant is earlier and more vigorous than Long Island Improved. Furthermore, the fruits have a black glossy appearance which is more desirable than a dull purple.

Big Boston lettuce is a great favorite for spring and fall use as it is vigorous and a producer of large hard heads which carry well in shipment. However, we need another variety which grows quickly, can stand the heat of summer and yet produce a head similar to Big Boston. The best variety we have found for this purpose is Simon's Cabbage Head. A small planting is made extremely early. It will be ready one week quicker than Big Boston. Again along in July when it comes time to plant the first fall lettuce Simon's Cabbage Head is used because it can stand the heat. Salamander resists the heat too but the heads aren't large enough. May King is a quick grower for early spring but it is too small and tender for commercial use.

Dutch Butter has a beautiful color but with us the stem is excessively large and the head is elongated rather than "close to the ground." As to musk melons, or cantaloupes, we use the Knight or Maryland because it is of the desirable Rocky Ford type but larger so that it fills up quickly.

The Southport Yellow Globe onion is the only variety we grow. It yields well and is a good keeper. Red onions are out of date; white onions are shy yielders and poor keepers.

Hollow Crown parsnip is the only variety we have ever used. There are a multitude of desirable peas. For first early planting we use three varieties which mature in succession: Laxtonian, Gradus and Telephone. A second planting of the Telephone variety is made three weeks after the first big sowing. Then the last planting will come in one week after the first sowing of Telephone.

The Ruby King pepper is still our favorite, however, we have found by trial that the World Beater is a more meaty and more desirable pepper but it didn't yield heavily. Savoy spinach is the favorite because it is a free grower. The Bonny Best tomato is the finest early variety we have found. The Earliana is a few days earlier but the quality is miserable. We don't want it. For main crop in early fall we use Great Baltimore.

COUNTY NOTES

Otsego Co., N. Y.—Potato growers of this country have recently received a severe shock to their business. Market prices have declined to 35 cents a bushel. Seed last spring was \$3.00 a bushel and some growers paid 40 or 50 cents an hour for labor in planting and digging. Farmers who sold their crop in the fall were fortunate, though the price was only \$1.25, which was less than the cost of production. Those who sold their seed were more lucky than those who planted. This is a disastrous condition of affairs in consideration that commercial potato growing is a leading industry in certain parts of this county, where potatoes have been the main, and sometimes the only cash crop, and in a few instances, practically the only source of income. It is impossible to determine at this early date what reaction the present situation will bring to bear on the 1921 potato acreage.—C. F. Myer, Otsego Co., N. Y.

Indiana Co., Pa.—The winter has been very mild and we had only two or three days of sledding in January. Fall grain looks good. Growers still have a good many potatoes to sell. Prices were too low in the fall to encourage selling and they are not much better now. Retail prices: Shelled corn, \$1.12 bushel; oats, 75c to 80c; rye, \$1.75 and scarce; butter, 70c; eggs, 70c; fresh pork, 20 @ 25c; potatoes, \$2.00; apples, \$1.40 to \$1.60.—David W. Stahl.

Washington Co., Pa.—There has been very little snow this winter and the ground has not been frozen much of the time. This has been bad on wheat and young timothy. Much of it makes a poor showing as the seedling was very late. Work is slack and many mines have closed. Idleness and crime are on the increase. Farmers are busy hauling manure and feed and caring for stock. Some are cutting mine props which are selling for 12c to 16c for six-foot lengths. Practically all of the 1920 wool clip is in the growers' hands yet. Some of it was pooled. No buyers yet but talk of 33c. Should bring \$1 to net growers anything. Hay \$28 to \$30, corn 80c, oats 50c, butter 55c, eggs, 70c.—Bruce McNinch.

Carroll Co., Md.—The open winter has made it possible for grading to progress for the state road between Westminster and New Windsor. Some ice has been harvested about four inches in thickness. Wheat is looking bad. Hides are very cheap; only first-class hides can be sold. The sanitary reduction plant is reported to have a large stock of hides on hand as there is no market. The railroad shops at Union Bridge have laid off more men. The cigar factory at Manchester, which was closed by a revenue officer because the tobacco was stripped in private homes, has been reopened since the strippers have been bonded. The fruit growers' association held a meeting Feb. 1 for discussing co-operative buying of supplies and marketing. 350 pounds of wool were shipped to the woolen mills, which are under contract with the sheep men to make blankets and robes. Prices are lower, eggs dropping to 55c dozen and wheat to \$1.70 bushel, while corn has advanced to \$3.25 bbl.—Harry I. Rinehart.

The sun is coming back; good days outdoors offer chances for pruning and fence repairing; bad days can be used repairing farm machinery.

Kodak on the Farm

On the farm Kodak serves a double purpose. Like the auto it is ready for business or for pleasure.

It is always ready for pictures in and about the home. The children, the family pets, the grange picnic, the thousand and one familiar scenes around the farm—all these contribute delightfully to the family Kodak album.

And there's a worth-while business use for the Kodak on every farm. It keeps a record of crop and orchard growths, the progress of building, the condition of the "line fence." It sells live stock.

And picture taking by the Kodak method is simpler and less expensive than you think. A catalogue of Kodaks and Brownies free by mail or at your dealer's.

The YEAR 'ROUND TRACTOR

There is work the Huber Light Four can do for you at every season—Spring, Summer, Fall and Winter. It does it more rapidly and economically than you can do it any other way.

The Huber Light Four will do your plowing quickly and cheaply. It will rapidly and thoroughly prepare the seed-bed when the ground is just right. It is a general purpose tractor suitable for all heavy field work in the Spring and Summer. In the Fall it will run the ensilage cutter, thresher or corn shredder. In the Winter it can buzz wood, grind feed, pull a saw mill or do many of the other odd jobs around the farm. It is an all weather tractor and you can keep it going profitably throughout the year.

This is the Huber feature that gives the tractor great flexibility, every short turning radius and permits the use of high wheels. High wheels make steering easier, pack the ground less, save power by causing the tractor to roll easier.

At every task it is dependable because its perfected design and perfect balance developed throughout many years of experience have left no weak spots.

The Huber is seen the country over and is known everywhere as "the tractor that always keeps going." It has won its spurs.

A country-wide system of service branches assures prompt attention to the needs of all owners.

"If the Army Used it We Have It"

"BRIGHT LIGHTS" FOR THE FARM

As a jazzy, tuneful melody, "How You Gonna Keep 'Em Down on the Farm?" has long since been discarded. But as an actual problem, it still holds the attention and consideration of many a mother and father of rural America. How is this trend of country boys and girls to the cities being checked? For it is being checked to a noticeable extent, even though the progress is slow.

"By making country life livelier and more attractive" might be a general answer to the problem. But that brings up the question: "How?" And this question is best answered by the findings of investigators of the research division of the Home Economics Society.

In a recently completed survey which covered various rural sections of several states, these investigators found that modern conveniences and labor-saving devices in and about the farm home are the most important factors in making young men and women more satisfied and contented with rural life. Many of the pleasures and conveniences that they used to go to the cities for, are being taken to the farm.

Automobiles, player pianos, talking machines, good magazines, water plants, washing machines, tractors, log saws—a score of other devices all are playing a part in adding pleasure and eliminating discontent on the farm and keeping boys and girls at home. Yet there is another factor, which, according to the survey, is exerting an even greater influence than any of the foregoing in "Keeping 'em down on the farm."

"Bright lights"—that's what is helping to keep them on the farm—instead of luring them away!

Bright, cheerful light for every task in the home, and for every pleasure—reading, playing games, dancing, and for just sitting around the family circle—works for a happier home and a more contented family. And the means of this happiness and contentment is easily within the reach of every rural resident.

While it is found that some of the larger farm homes have their own electric lighting plants, the improved gasoline lamp is fast becoming the favorite farm light according to the survey. The investigators find that while low first cost and low cost of operation has something to do with the favors shown gasoline lights, the real reason lies in the abundance of brilliant, mellow, pure white light that these lamps give. Burning common motor gasoline and lighting with matches, these improved gasoline lights give a steady, 300 candle power brilliance of a natural, daylight quality. Under these rays one may match the most delicate colors.

A gasoline lamp of the most modern and approved design can now be purchased for little more than an ordinary old-fashioned kerosene lamp costs. And the cost to use the gasoline lamp is little more than a penny a night. The fuel expense in one year's time more than pays for the lamp. All the while the whole family is enjoying a light that guards against eye-strain.

Years ago there was a feeling—perhaps justified—that gasoline lights were dangerous. The fact that the better gasoline lamps and lanterns of today are on the permitted list of the National Board of Fire Underwriters, removes all doubt as to their safety. If they were not safe they would not be permitted on this list.

+ "Kiltone" materials second to none +

"It having been our privilege to have some prominent orchardists and growers test Kiltone products, we feel that it is due you to produce second to none and to supply you with fungicides and insecticides."

THE special process used in manufacturing Kiltone Spray materials adds materially to their effectiveness and produces results which cause growers to demand Kiltone materials in preference to many other forms of insecticides and fungicides.

Kiltone Products Include
Improved Kiltone—fungicide, poison and leaf stimulator in paste form for potatoes, tomatoes and many other ground crops.
Modified Kiltone—fungicide and leaf stimulator for ground crops where poison is not required.
Beetle Mort Powder—wet or dry insecticide for ground crops. Also Sulpho-Arsenate of Lead.
Ask the Kiltone dealer or write for booklet.

The "U.S." Bootee

Wear them all day— your feet stay dry and comfortable

WHEN the ground is wet, and your job means lots of walking, what sort of footwear do you put on? Ordinary leather shoes get soaked and caked with mud in no time.

For such work you need the lightweight comfort of a shoe combined with the protection of a boot. And here at last is a shoe that gives you this combination—the U. S. Bootee. It's a watertight rubber shoe—designed originally for miners, and now becoming popular with farmers everywhere.

Solid comfort all the time—that's what the U. S. Bootee means for you. It fits smoothly over your sock like an ordinary shoe. It gives you perfect freedom of movement, yet in the wettest weather—over the muddiest ground—it keeps your feet absolutely dry.

"U. S." Boots—Reinforced where the wear is hardest. Made in all sizes and styles—Hip, Half-hip and Knee. In red, black and white.

"U. S." Rubbers—A wide range of models, in light and heavy styles to meet every need. Made in all sizes, for men, women and children.

comfortable they are—examine for yourself their wonderful built-to-wear construction.

Other types of "U. S." footwear—built for rough service

U. S. Boots have all the wear and comfort which the accumulated improvements of 74 years have given them.

U. S. Walrus combine the warmth and convenience of a cloth-top arctic with the protection of a rubber boot. They slip on over your leather shoes, and you can wash them clean instantly while they're still on your feet.

The U. S. line of footwear has a type for every need—arctics, rubbers, "overs." Every one is backed by over half a century of experience. The rubber comes from our own plantations—the whole process of manufacture is supervised by experts.

Always look for the U. S. Seal—it means solid wear and long service for your money.

Strong Sturdy Gloves for Farm Use

BOSS Work Gloves are exactly suited to farm work. They're tough enough to stand day after day of hard labor such as plowing, building a stone wall, establishing a water system, stretching fencing, or all construction work. Yet they are so flexible that you can tighten a bolt or place a cotter pin with them on.

These gloves are made of the finest quality Canton flannel. They give extra long wear. They fit well and feel well on the hands. For a hundred odd jobs, indoors or out, Boss Work Gloves protect the hands from grease, cuts, bruises and many minor injuries.

Ask for them by name. Boss Gloves come in three styles of wrist—ribbed, band and gauntlet. And in sizes for men and women, boys and girls.

THE BOSS MEEDY—best quality, medium weight canton flannel.
THE BOSS HEVY—very best quality, heavy weight canton flannel.
THE BOSS XTRA HEVY—finest grade of extra heavy canton flannel.
THE BOSS WALLOWER—highest quality, heaviest weight canton flannel.
THE BOSS LETHERPOM—heavy canton flannel with tough leather on palms, fingers and thumbs.
THE BOSS JERZY—highest quality cotton jersey cloth in many colors.
THE BOSS TIKMIT—Roomy mittens made of ticking that wears like iron.
THE BOSS ELASTO—strong canton flannel. Made by a patented process in one weight only.

TALKS WITH THE BOYS

MR. BARN OWL PAYS FOR HIS LODGING

Several nights while throwing down some hay from the hay loft I had noticed several headless English sparrows lying on the hay just below the cupola in the barn. I supposed that one of the cats which I had often seen about in the barn had caught more of the little pests than she could eat and so had left the remains lying there.

But the next night as I stepped off the ladder I discovered the real slayer of the sparrows, when a large bird flew to the end of the barn and perched himself on the hay-carrier track and then turned his head about to look at me. It was one of those odd-faced barn owls. I knew immediately that he had been catching the sparrows in the evening as they came in to roost in the cupolas, and in the edges of the hay near the blinds, and was glad to know that I had this efficient help in combatting the pesky sparrows.

But what an odd looking bird he was as he sat there, his head turning slowly about following my movements with his small brown eyes. Also their faces are very long which makes their facial expressions like monkeys and in the South they are often called "monkey-faced" owls because of this characteristic.

Their plumage is very soft, yellowish-brown and white, finely speckled and barred.

It was a very cold evening and occasional blasts of wind brushed back the feathers of his side exposing more clearly his long legs. But I knew and was glad of the fact that he had a warm shelter for the night, for as soon as I was gone he would fly back into the barn and begin his search for more late sparrows coming in to sleep for the night, and during the long night he would have many chances to catch playful mice scampering over the hay.

Oh yes! he would be wide awake all night and the morning sun would warn him that it was time to close his eyes, just when all the rest of the world was thinking of another day of activity. It was glad to discover that I had such a valuable ally to help me in reducing the great number of sparrows about the place, and in few weeks the decrease in numbers of these little pests was quite noticeable.—John B. Behrends, Hanna City, Ill.

LETTERS FROM THE BOYS

Dear Editor—I am glad that there is a Boy's Department in Pennsylvania Farmer. I am fifteen years old and have lived on the farm all my life and like farm work very much. I go to school every day.

I would like to get a place on a large farm to work where I could do some trapping in winter. There is always quarreling going on at home and I am getting tired of it. My parents say that if I do not want to stay at home that I could go when the spring comes. Now if any of the other readers know of a farmer or dairyman who needs some one to help, tell him to write to me. Now I hope that all the boys will take a hand in this paper and help make it successful. I love to read about the other boys and the things of this paper. I subscribed for it and I am

never sorry I did, for it is a pleasure to read it.—"George."

We omit printing this boy's name altho he signed the letter and did not tell us not to leave it off. He seems to have courage, but for his own sake we withhold his name. If anyone wishes to write him, send the letter to us and we will forward it. "George" touches a subject that is a cause of trouble in a great many homes. The home life of many a family is unbearable to sensitive, just souls because some of the members get into the habit of quarreling with each other. I wish it were possible to publish a remedy to cure this habit. It not only dwarfs the souls and spoils the lives of those who quarrel, but it makes life miserable for others in the family. The nagging, scolding, quarreling habit is usually the sign of a weak and narrow but egotistical spirit. It can be overcome by those who are big enough to do so by keeping quiet when inclined to say mean things, thinking pleasant thoughts and trying to help instead of hurt others. They should devote more time to reading, music, games, talking about helpful things, etc. These will help cure the diseased mind and to broaden the view so that bigger things than our own petty affairs may be seen and appreciated.—Editor.

Dear Editor—I saw some letters written by boys published in the Pennsylvania Farmer and thought I would try to write one. I am fifteen years old and am in the eighth grade in school. I live in Wilmet Township on a dairy farm of 160 acres. We have fifteen cows, twenty-five sheep and six horses. I take care of the horses and my father and other brothers take care of the cows. I take the milk to the milk-stand every morning, which is about a mile and a half from our home. I have a flock of thirteen chickens of my own, and get six eggs a day. My younger brother has a flock of eight chickens.

I like to trap and hunt. Last year my brothers and I caught \$66 worth of fur and my youngest brother (five years old) got \$13 worth of furs.

We have a traction engine and in the fall we fill our neighbors' silos and I fire the engine while my brother feeds the cutter.

My brothers and I had a yoke of oxen and we thought we would like a colt better, so we sold the oxen as they were almost two years old, and bought a colt four months old, and now we have a nice horse.—Adrian T. Fisk, Bradford Co., Pa.

FAITHFUL TO EACH OTHER

Since publishing the Vest eulogy on the dog we have received the following touching news item:

John Smith, sixty-nine years old, who for years has lived in a lonely cabin in the woods with only a mongrel dog for companion, yesterday applied for admittance to the Ashland County, Wis., Poor Farm, ill health having precluded the thought of existing by his own efforts thru the winter.

"Yes, I guess I can find room for you," the superintendent of the poor farm told Smith, "but you can't bring that dog in."

Smith gazed at his dog. The years had made him almost as decrepit as his master. Tears rolled down the old man's cheeks as he sorrowfully turned away, the dog following him. Last evening the bodies of man and dog were found in the lonely cabin. Smith's old hunting rifles with which he had ended their lives, were beside him.

The Voice of the Pack

by Edison Marshall

CHAPTER XI

THE Lennox home, in the far wilderness of the Umpqua Divide, looked rather like an emergency hospital for the first few days after Dan's fight with Whisperfoot. Its old sounds of laughter and talk were almost entirely lacking. Two injured men and a girl recovering from a nervous collapse do not tend toward cheer.

But the natural sturdiness of all three quickly came to their aid. Of course Lennox had been severely injured by the falling log, and many weeks would pass before he would be able to walk again. He could sit up for short periods, however; had the partial use of one arm; and could propel himself—after the first few weeks—at a snail's pace thru the rooms in a rude wheel chair that Bill's ingenuity had contrived. The great livid scratches that Dan bore on his body quickly began to heal; and before a week was done, he began to venture forth on the hills again. Snowbird had remained in bed for three days; then she had hopped out, one bright afternoon, swearing never to go back into it again. Evidently the crisp, fall air of the mountains had been a nerve tonic for them all.

Of course there had been medical attention. A doctor and a nurse had motored up the day after the accident; the physician had set the bones and departed, and the nurse remained for a week, to see the grizzled mountaineer well on the way of convalescence. But it was an anxious wait, and Lennox's car was kept constantly in readiness to speed her away in case the snows should start. At last she had left him in Snowbird's hands, and Bill had driven her back to the settlements in his father's car. The die was now cast as to whether or not Dan and the remainder of the family should winter in the mountains. The snow clouds deepened every day, the frost was heavier in the dawns, and the road would surely remain open only a few days more.

Once more the three seemingly had the Divide all to themselves. Bert Cranston had evidently deserted his cabin and was working a trap-line on the Umpqua side. The rangers left the little station, all danger of fire past, and went down to their offices in the federal building in one of the little cities below. Because he was worse than useless in the deep snows that were sure to come, one of the ranch hands that had driven up with Bill rode away to the valleys the last of the live stock—the horse that Dan had ridden to Snowbird's defense.

Nothing had been heard of Landy Hildreth, who used to live on the trail to the marsh, and both Lennox and his daughter wondered why. There were also certain officials who had begun to be curious. As yet,

Dan had told no one of the grim find he had made on his return from hunting. And he would have found it an extremely difficult fact to explain.

It all went back to those inner springs of motive that few men can see clearly enough within themselves to recognize. Even the first day, when he lay burning from his wounds, he worked out his own explanation in regard to the murder mystery. He hadn't the slightest doubt but that Cranston had killed Hildreth to prevent his testimony from reaching the courts below. Of course any other member of the ar-

alone.

had an actual sense of duty to do all that he could to stop the activities of the arson ring, his motives, stripped and bare, were really not utilitarian. He had no particular interest in Hildreth's case. He remembered him simply as one of Cranston's disreputable gang, a poacher and a fire bug himself. When all is said and done, it remained really a personal issue between Dan and Cranston. And personal issues are frowned upon by law and society. Civilization has toiled up from the darkness in a great measure to get away from them. But human nature remains distressingly the same, and Dan's desire to pay his debt was a distinctly human emotion. Sometime a breed will live upon the earth that can get clear away from personal vengeance—from that age-old code of the hills that demands a blow for a blow and a life for a life—but the time is not yet. And after all, by all the standards of men as men, not at read in idealistic philosophies—Dan's debt was entirely real. By the light held high by his ancestors,

as the eating places in the berry thickets remain open. The cougars had all gone down with the deer, the migratory birds had departed, and even the squirrels were in hiding.

The scene didn't offer much in the way of clues. Of the body itself, only a white heap of bones remained; for many and terrible had been the agents at work upon them. The clothes, however, particularly the coat, were practically intact. Greeting himself, Dan thrust his fingers into its pockets, then into the pockets of the shirt and trousers. All papers that would in any way serve to identify the murdered man, or tell what his purpose had been in journeying down the trail the night of the murder had been removed. Only one explanation presented itself. Cranston had come before him, and searched the body himself.

Dan looked about for tracks, and he was considerably surprised to find the blurred, indistinct imprint of a shoe other than his own. He hadn't the least hope that the tracks themselves would offer a clue to a detective. They were too dim for that. The surprising fact was that since the murder had been committed immediately before the fall rains, the water had not completely washed them out. The only possibility remaining was that Cranston had returned to the body after the week's rainfall. The track had been dimmed by the lighter rains that had fallen since.

But yet it was entirely to be expected that the examination of the body would be an afterthought on Cranston's part. Possibly at first his only thought was to kill and, following the prompting that has sent so many murderers to the gallows, he had afterwards returned to the scene of the crime to destroy any clues he might have left and to search the body for any evidence against the arson ring.

Dan's next thought was to follow along the trail and find Cranston's ambush. Of course, it would be in the direction of the settlement from the body, as the bullet had entered from the front. He found it hard to believe that Hildreth had fallen in the exact spot where the body lay. Men journeying at night keep to the trail, and the white heap itself was fully forty feet back from the trail in the thickets. Perhaps Cranston had dragged it there to hide it from the sight of any one who might pass along the lonely trail and it was a remote possibility that Whisperfoot, coming in the night, had tugged it into the thickets for dreadful purposes of his own. Likely the shot was fired when Hildreth was in an open place on the trail; and Dan searched for the ambush with this conclusion in mind. He walked back, looking for a thicket from which such a spot would be visible. Something over fifty yards down he found it; and he knew it by the empty brass rifle cartridge that lay half buried in the wet leaves.

The shell was of the same caliber as Cranston's hunting rifle. Dan's hand shook as he put it in his pocket. Encouraged by this amazing find, he turned up the trail toward Hildreth's cabin. It might be possible, he thought, that Hildreth had left some of his testimony—perhaps such rudely scrawled letters as Cranston had written him—in some forgotten drawer in his hut. It was but a short walk for Dan's hardened legs, and he made it before mid-afternoon.

The search itself was wholly without result. But because he had time to think as he climbed the ridge,

A Fable

There is a good story that often is told,
Concerning two frogs which in days of old,
Fell into a pail—by mistake, of course—
But the pail contained cream; and that made things worse.

Now frogs, though they swim in the water you know,
Can't swim forever—it tires them, and so,
One said, "Tis no use, we must certainly die,"
But the other said, "No! to jump out we can try."

Well, the first lost his courage, and sinking was drowned,
But the other kept kicking all right, and was found
Afloat in the morning—and how the maid laughed!
On a big chunk of butter that served as a raft!

His kicking had churned up the cream don't you see?
"I'm glad I kept kicking, I'm sure," then said he.
The maid, when she saw him so bright and so chipper,
Released him by means of a long-handled dipper.

The moral is this—and I hope all will hear it,
The frog that survived had a brave, "kicking" spirit.
And if you would win when things seem to go wrong,
Keep kicking! Keep kicking! and whistle a song!

And maybe the things that seem threatening will turn
To aids, like the cream that the froggie did churn.
But if you lose heart and stop kicking you know,
Like the first little frog to the bottom you'll go.

No matter if everything seems to go wrong,
Keep kicking! Keep kicking! 'Twill change before long!
And so when you're tempted to give up and fail,
Just think of the frogs that fell into the pail!

son ring of hillmen might have been the murderer; yet Dan was inclined to believe that Cranston, the leader of the gang, usually preferred to do such dangerous work as this himself. If it were true, somewhere on that tree-clad ridge clues would be left. By a law that went down to the roots of life, he knew, no action is so small but that it leaves its mark. Moreover, it was wholly possible that the written testimony Hildreth must have gathered had never been found or destroyed. Dan didn't want the aid of the courts to find these clues. He wanted to work out the case himself. It resolved itself into a simple matter of vengeance: Dan had his debt to pay and he wanted to bring Cranston to ruin by his own hand.

While it was true that he took rather more than the casual interest that most citizens feel in the destruction of the forest by wanton fire, and

he could not turn his other cheek. Just as soon as he was able, he went back to the scene of the murder. He didn't know when the snow would come to cover what evidence there was. It threatened every hour. Every wind promised it. The air was sharp and cold, and no drop of rain could fall thru it without crystallizing into snow. The deer had all gone, and the burrowing people had sought their holes. The bees worked no more in the winter flowers. Of all the greater forest creatures, only the wolves and the bears remained—the former because their fear of men would not permit them to go down to the lower hills, and the latter because of his knowledge that when food became scarcer, he could always burrow in the snow. No bear goes into hibernation from choice. Wise old bachelor, he much prefers to keep just as late hours as he can—as long

because as he strode along beneath that wintry sky he had a chance to consider every detail of the case, he was able to start out on a new tack when, just before sunset, he returned to the body. This new train of thought had as its basis that Cranston's shot had not been deadly at once; that wounded, Hildreth had himself crawled into the thickets where Whisperfoot had found him. And that meant that he had to enlarge his search for such documents as Hildreth had carried to include all the territory between the trail and the location of the body.

It was possibly a distance of forty feet, and getting down on his hands and knees, Dan looked for any break in the shrubbery that would indicate the path that the wounded Hildreth had taken. And it was ten minutes well rewarded, as far as clearing up certain details of the crime. His senses had been trained and sharpened by his months in the wilderness, and he was able to back-track the wounded man from the skeleton clear to the clearing on the trail where he had first fallen. But as no clues presented themselves, he started to turn home.

He walked twelve feet, then turned back. Out of the corner of his eye it seemed to him that he had caught a flash of white, near the end of a great, dead log beside the path that the wounded Hildreth had taken. It was to the credit of his mountain training alone that his eye had been keen enough to detect it; that it had been so faithfully recorded on his consciousness; and that, knowing at last the importance of details, he had turned back. For a moment he searched in vain. Evidently a yellow leaf had deceived him. Once more he retraced his steps, trying to find the position from which his eye had caught the glimpse of white. Then he dived straight for the rotten end of the log.

Into a little hollow in the bark, on the underside of the log, some hand had thrust a small roll of papers. They were rain soaked now, and the ink had dimmed and blotted; but Dan realized their significance. They were the complete evidence that Hildreth had accumulated against the arson ring—letters that had passed back and forth between himself and Cranston, a threat of murder from the former if Hildreth turned state's evidence, and a signed statement of the arson activities of the ring by Hildreth himself. They were not only enough to break up the ring and send its members to prison; with the aid of the empty shell and other circumstantial evidence; they could in all probability convict Bert Cranston of murder.

For a long time he stood with the shadows of the pines lengthening about him, his gray eyes in curious shadow. For the moment a glimpse was given him into the deep wells of the human soul; and understanding came to him. Was there no balm for hatred even in the moment of death? Were men unable to forget the themes and motives of their lives, even when the shadows closed down upon them? Hildreth had known what hand had struck him down. And even on the frontier of death, his first thought was to hide his evidence where Cranston could not find it when he searched the body, but where later it might be found by the detectives that were sure to come. It was the old creed of a life for a life. He wanted his evidence to be preserved—not that right should be wronged, but so that Cranston would be prosecuted and convicted and

made to suffer. His hatred of Cranston that had made him turn state's evidence in the first place had been carried with him down into death.

As Dan stood wondering, he thought he heard a twig crack on the trail behind him, and he wondered what forest creature was still lingering on the ridges at the eve of the snows.

CHAPTER XII

The snow began to fall in earnest at midnight—great, white flakes that almost in an instant covered the leaves. It was the real beginning of winter, and all living creatures knew it. The wolf pack sang to it from the ridge—a wild and plaintive song that made Bert Cranston, sleeping in a lean-to on the Umpqua side of the Divide, swear and mutter in his sleep. But he didn't really waken until Jim Gibbs, one of his gang, returned from his secret mission.

They wasted no words. Bert flung aside the blankets, lighted a candle, and placed it out of the reach of the night wind. It cast queer shadows in the lean-to and found a curious reflection in the steel points of his eyes. His face looked swarthy and deep-lined in its light.

"Well?" he demanded. "What did you find?"

"Nothin'." Jim Gibbs answered gutturally. "If you ask me what I found out I might have somethin' to answer."

"Then—" and Bert, after the manner of his kind, breathed an oath—"what did you find out?" His tone, except for an added note of savagery, remained the same. Yet his heart was thumping a great deal louder than he liked to have it. He wasn't amused by his associate's play on words. Nor did he like the man's knowing tone and his air of importance. Realizing that the snows were at hand, he had sent Gibbs for a last search of the body, to find and recover the evidence that Hildreth had against him and which had not been revealed either on Hildreth's person or in his cabin. He had become increasingly apprehensive about those letters he had written Hildreth, and certain other documents that had been in his possession. He didn't understand why they hadn't turned up. And now the snows had started, and Jim Gibbs had returned empty-handed, but evidently not empty-minded.

"I've found out that the body's been uncovered—and men are already searchin' for clues. And moreover—I think they've found them." He paused, weighing the effect of his words. His eyes glittered with cunning. Rat that he was, he was wondering whether the time had arrived to leave the ship. He had no intention of continuing to give his services to a man with a rope-noose closing about him. And Cranston, knowing this fact, hated him as he hated the buzzard that would claim him in the end and tried to hide his apprehension.

"Go on. Blat it out," Cranston ordered. "Or else go away and let me sleep." It was a bluff; but it worked. If Gibbs had gone without speaking, Cranston would have known no sleep that night. But the man became more fawning.

"I'm tellin' you, fast as I can," he went on, almost whining. "I went to the cabin, just as you said. But I didn't get a chance to search it—" "Why not?" Cranston thundered. His voice re-echoed among the snow-wet pines.

(Continued Next Week).

The Most for Your Money

BE SURE to get this Powerful Onepipe Furnace that is made by the makers of the "Old Reliable" STEWART Stoves and Ranges, which since 1832 have been famous for good honest quality and absolutely dependable service.

STEWART Onepipe Furnace

—is the moderately priced, easily installed new type of Warm-air Furnace that RIGHT NOW in thousands and thousands of farm homes is giving GREAT satisfaction—furnishing heat in abundance for every room, even in below-zero weather—and using LESS coal or wood than was used with stoves or other heaters.

Just the same high-quality iron and steel and expert workmanship—that have made STEWART cook-stoves so dependable and satisfactory for nearly ninety years—are also now being put into the STEWART ONEPIPE. It really is the "unseen things" in a furnace that count—and those inner parts of the STEWART are EXTRA well made. Its heavy corrugated steel lining, heavy triangular grate bars, large water pan, large space between inner and outer casing, are reasons for its tremendous success.

Ordinary Sloping Firepot

STEWART Straight Firepot

Above at the left is pictured the firepot of the ordinary pipeless furnace. Note how the sloping sides collect ash, which deadens the fire and prevents proper radiation. Picture at the right shows the STEWART firepot, built EXTRA heavy and with STRAIGHT sides to increase grate area, coal capacity, heat radiation and assure perfect combustion. This is just one of the many features that make the STEWART ONEPIPE so successful.

CANNIBALISM

Poultry Editor, Pennsylvania Farmer: Will you please tell me a remedy for cannibalism among chickens? I have S. C. W. Leghorns and have been troubled for some time by the hens trying to eat each other. I feed them a scratch feed of cracked corn and oats regularly and keep a good dry mash, oyster shells and grit before them all the time.—Eugene Eter, Franklin Co., Pa.

E. E. Franklin Co., Pa.—Cannibalism among fowls is most prevalent among young stock but may occur in the form of feather eating among mature fowls. A slight injury to one bird may cause constant pecking from other hens to obtain the blood. Isolate any hens that start the habit or it will spread rapidly. The hens need plenty of meat food and exercise to detract their attention from each other. Try hanging a piece of beef from the ceiling so the hens can peck at it. Examine the birds for lice as that is considered a common cause of feather pulling.

If the hens are closely yarded it will be difficult to cure the habit. Turn them out to range if possible. It seldom happens in a healthy free range flock. It will pay to kill and market birds that persist in the habit and start with new stock which will probably not start it if they have exercise and a balanced ration.

BALANCING THE RATION

We read that 25 lbs. each of wheat, oats, corn and barley, on an average, will produce 224 yolks of eggs, and 154 whites of eggs. Now, can you tell me what to feed to produce an equal number of whites? No doubt a protein food is required, but what food is it that contains this required amount of protein? If I can learn this I think I can bring my hens up to their maximum efficiency.—J. N. C., Center Co., Pa.

The use of a balanced ration containing scratch grain, and mash is supposed to produce approximately the same number of whites as yolks. For example there is a commercial grain mixture and egg mash advertised on that basis. 100 pounds of wheat, corn, barley and kafir are supposed to produce 239 yolks and 147 whites.

They balance their mixtures so that 50 pounds of the scratch grain is supposed to make 123 yolks and 71 whites. Fifty pounds of the dry mash is supposed to make 91 yolks and 141 whites. By adding it is found that 100 pounds of the feed consisting of 50 pounds of the mash and 50 pounds of the scratch grain will produce 214 yolks and 212 whites.

In theory it is alright and the mash does make hens lay. But we learn by practical experience with our flocks that hens are different and the same ration will not produce equal results when fed to different individuals. In other words, you cannot feed a hen a certain ration and know she will produce so many whites and so many yolks. She may get the ration to do it but she simply does not use the ration for the purpose given. She might produce more or less eggs than could naturally be expected from her.

Here is a dry mash mixture that will give good results: 100 lbs. middlings, 100 lbs. bran, 100 lbs. corn meal, 100 lbs. ground oats, 60 lbs. meat scrap, 50 pounds gluten meal, 1 lb. salt.

Poultrymen generally use from 10 to 20 per cent of beef scrap in the dry mash, depending on the grade of the beef scrap and breed of poultry. Leghorns seem to stand more beef

Live, Grow, Lay and Pay!

—that's the whole history of a Hillpot Quality Chick

Pleased customers write how well they thrive—how quickly they grow—how soon these pullets begin to lay steadily. Of course they pay.

scrap without bad effect than some of the heavier breeds.

DAMP FLOORS

Our experience with damp floors may be of value to those who have had trouble of this kind. Last year we had 275 pullets in a pen on the second floor. The floor was double with roofing paper between, the upper or service floor made of matched flooring very carefully laid. The stables below were well ventilated.

There were windows on two sides, one side or the other always open, depending on the direction of the wind. The windows on one side when open to their widest were 3x18 feet. Yet, in spite of all we could do the floor and litter became very damp, not to say wet, and necessitated frequent change of litter.

The same birds, now yearlings, are in that pen at this time, together with 50 more—325 in all, and it is one of the driest we have. This is the face of the fact that we are having a great deal more rain and damp weather this season than last.

Pen No. 6, on the ground level, contains 400 pullets. The floor is of concrete with concrete walls three feet high; the rest is of lumber. Windows on the southeast 3x24 ft., most of them open at all times. In severe storms half of them closed with glass sash, the remainder on similar occasions somewhat protected by very coarse woven burlap. Our experience of last year is repeated. The litter becomes damp and foul and rarely lasts in a fit condition longer than a week.

Those two examples would suggest that pullet pens are more likely to be damp than pens containing older birds. Pullets, as a rule, lay better during the fall and winter; they require more feed and drink much more water. No water, no eggs. But, though the egg is so largely made of water, they drink much more than for their immediate bodily needs and to store in the eggshell. The excess is, of course, voided, and dampness is one of the results.

Our present pullet pen was built about 15 years ago and the concrete is thoroughly dry. It was intended and served originally for a hog stable, accommodating 40 swine in 8 pens. As soon as it was finished and the swine put in the trouble began. Ceiling and walls dripped with moisture in milder days and were white with frozen vapor in cold weather. We determined to put in good ventilators as soon as warmer weather came; but there was a rush of spring work and nothing was done. The following winter, with no change, our hog house was as dry as a chip; and as long as it was used for hogs there was no more trouble.

The explanation is simple. A great deal of water goes into concrete. Although the concrete sets and becomes hard enough to permit use of the building, the water largely remains and is given off slowly and steadily as hardening progresses. Any one who makes a concrete floor may easily determine this. When the floor has become hard and apparently dry, lay down a newspaper or a piece of roofing. In a few days take it up and note the result. You will find the under side of the paper damp, almost wet. The surface of the floor will likewise show moisture. The water on its way out was stopped by the paper and could not escape.

A board floor tight enough to be warm for the hens will suffer very little from lack of ventilation beneath it.—Howard Mitman.

Protect your Ford engine from this abuse

CARRYING you there and back on long, fast trips, doing errands all about town, always on the job—that's your Ford when you treat it fairly.

The Ford has a remarkable engine, compact and finely made. When overheating, excess carbon, pounding bearings tax temper and pocket book, it is nine chances to one that you have been using inferior oil.

Under the intense heat of the engine—200° to 1000° F.—ordinary oil forms great quantities of black sediment. Sediment has no lubricating

value. It causes premature wear which will cut the life of your engine in two.

You can eliminate engine trouble from this source. Sediment is reduced 86% when you use Veedol, the lubricant that resists heat. (See the two bottles below.)

Have your engine flushed out to cleanse it of grit, sediment and thickened oil. Put in Veedol. Leading dealers have it in stock. Ask today for a supply of Veedol.

Veedol lubricants for every part of the car

Use Veedol lubricants for all parts of the car: VEEDOL for the engine (light, medium, heavy, special heavy, extra heavy); for the differential and transmission VEEDOL TRANS-GEAR OIL or GEAR COMPOUND; for the tractor and truck WORM DRIVE OIL; GRAPHITE GREASE; CUP GREASE.

Ordinary oil after use. Veedol after use. Showing sediment formed after 500 miles of running.

TOP-DRESSING TALK No. 5

Nitrogen Helps the Meadow

Timothy and other hay crops, like the grains, need a plentiful supply of quickly available nitrogen early in the season, and a top-dressing of Sulphate of Ammonia, applied as soon as the frost is out of the ground, will often greatly increase the profits from the meadow.

In fertilizer demonstrations on 10 Ohio farms of various soil types, an average of 110 lbs. Sulphate of Ammonia per acre gave an increase of 1,646 lbs. of timothy. In every instance the top-dressing was profitable and on some soils the response to nitrogen was remarkable.

Arcadian Sulphate of Ammonia is the ideal top-dressing fertilizer. The analysis is 25 1/2% ammonia guaranteed. The ammonia is in an all soluble, quickly available and non-leaching form.

Arcadian is fine and dry and can be applied by hand or machine easily and uniformly. The amount recommended for the hay crop and for grains is from 50 to 150 lbs. per acre depending upon the natural fertility of the soil. For pasture lands 50 to 100 lbs. per acre is advisable.

FARM LABOR—A SOCIAL SURVEY

(Continued from Page 2).

more and more favor and many of the best hotels in the country are largely equipped with them. See Note 2).

The improvement which is most important to the housewife is running water. This makes it possible for her to have hot water by putting a fireback in the range and also saves her much effort in pumping.

Wages

The most concrete problem which the farmer has to meet in reference to his employment problems is that of cash wage. One large operator expressed the opinion that the whole problem of employment was one of money and if the farmer was willing to pay enough money he could get all the men he wanted. There is no doubt but that this is true. At the same time, there is no doubt but that there are other considerations beside money.

If a man were paid enough money, he would be willing to live in a hole in the ground, but it is an assured fact that it would be more economical to pay him less money and offer him a better place to live. Therefore, in the matter of wage, it must be considered in conjunction with other inducements such as housing, privileges, possibilities of promotion, recreation and general social conditions. There is a point which would give the greatest efficiency from a standpoint of maximum production with a minimum outlay of expense.

Data secured shows that there has been approximately 100 per cent increase in the cash wage since 1915. The increase in the cost of necessities of life, have also been approximately 100 per cent. Farmhands, generally express the opinion that it is more difficult to save money now than it was five years ago when they were receiving only one-half of the present amount in cash.

This is due largely to the fact that the farmhand spends almost his entire income on items of food and clothing, such as sugar, flour, meat and shoes, which have increased more than 100 per cent. The average wage paid, not considering bonuses or earnings of other members of the family, is \$795 a year in cash. This is practically fifteen dollars per week. The average value of privileges as estimated by the farm hand is \$228 a year. These vary from \$95 to \$437 according to the privileges allowed by individual farmers. Unfortunately, the larger privileges are not always found in the tenant families having the greater number of children. Three cases may be cited as illustrations; one family of eleven have a total income, counting privileges and extra earnings of \$1211 a year—another family of nine, all of them large enough to be good eaters, have a total income of \$1125 and still another family of nine have a total income of only \$1061. One colored family of six children and two adults have a total yearly income of \$965. This family said it would be impossible for them to make ends meet without help from charity.

The farmer who is most successful is the farmer who recognizes that he must have farmhands if he would make any money himself and who is willing to furnish conditions which will secure his labor even in competition with industry. It must be remembered that working people today are demanding better conditions

as expressed both in wage and living conditions than they were five years ago. It might be well here to quote from a speech delivered by Ambassador Geddes, who says:

"So far only the the swell of the storm centered in Europe laps your coasts, yet your daily press is already filled with news of strikes and what is vaguely called industrial unrest * * * In Europe we know that an age is dying. Here it would be easy to miss the signs of coming change, but I have little doubt that it will come. A realization of the aimlessness of life lived to labor and to die, having achieved nothing but avoidance of starvation and the birth of children also doomed to the weary treadmill, has seized the minds of millions."

There is nothing constructive in the argument of the farmer that city industries and government are taking away his labor. This condition exists and cannot be changed by the farmer. Neither is it of advantage to the farmer to allow his land to remain idle. The policy of not farming land with present prices and present prospects of market simply because farm labor cannot be secured at a figure which the farmer may consider sufficient is decidedly shortsighted. Not only does the value of the farm depreciate much more than the difference in the cost of securing labor would be, thru not being cultivated, but the profit of farming is also lost. It is true that there is an actual shortage of labor on the farms. This is primarily due to a culmination of circumstances resulting in the present crisis. For years the farm has been backward in the opportunities and conditions given to its labor. It has offered no inducement to the ambitions, industrious young man who wishes to accumulate wealth and has no capital to start.

There is no constructive value in condemning human traits which may seem to be selfish. As stated previously, people are going to get all they can for the least possible effort. The farmer is prone to condemn the farmhand for leaving conditions which did not offer him any possible outlet for his ambition. He also often condemns the wife of the farmhand, because she is not willing to earn a little extra for the family by outside work. This point of view is entirely negative and can in no way better labor conditions on the farm.

Hours

Other than the question of wage the farmhand is most concerned with the long hours which are demanded of him. On most farms, the minimum for field work is ten hours per day. This does not include approximately one hour for chores and barn work. When compared with the 8-hour day of industry, it is easy to see why the farmhand objects to the long hours of the country. (Note 3).

Note 3—Much can be said in favor of shorter hours on the farm, but comparison of working hours for city and country should take into consideration the fact that the farm laborer is at home when his day's work is done while the city laborer often has a tedious ride both night and morning, which materially lengthens his day. It may also be said that shop workers, as a rule, need shorter hours than field workers on account of the monotony and tension of their work. Even in industry, the eight-hour day is not the rule as a very large percentage especially of the less skilled class still work nine and nine and one-half hours.

(Continued Next Week).

Keep The Boy In School

THE pressure of urgent spring work is often the cause of keeping the boy out of school for several months. It may seem necessary—but it isn't fair to the boy! You are placing a life handicap in his path if you deprive him of education. In this age, education is becoming more and more essential to success and prestige in all walks of life, including farming.

Should you feel that your own education was neglected, through no fault of yours, then you naturally will want your children to enjoy the benefits of a *real education*—to have some things you may have missed.

With the help of a Case Kerosene Tractor it is possible for one man to do more work, in a given time, than a good man and an industrious boy, together, working with horses. By investing in a Case Tractor and Grand Detour Plow and Harrow outfit now, your boy can get his schooling without interruption, and the Spring work will not suffer by his absence.

Keep the boy in school—and let a Case Kerosene Tractor take his place in the field. You'll never regret either investment.

Feed Your Crops What Nature Lacks

YOUR fields are already rich in some plant foods. But they lack three of the foods your crops MUST have if you are to get abundant yields. Now read this carefully, because it is important to you.

Your crops need thirteen different chemical elements—or foods. Of these thirteen, ten are already in your soil in abundance.

Without the other three—Ammonia, Phosphoric Acid and Potash—you cannot possibly profit by the ten you already have!

These three foods you can best supply in Dempwolf's Fertilizers. Add these foods to what your soil already has and you can produce bountiful crops. Without them, your crops must practically starve, no matter how well you care for them otherwise.

For 50 years, we have been furnishing Dempwolf's Fertilizers to the best farmers of this section. We surely know our business, and you can just as surely profit by the knowledge of fertilizers we have gained in all these 50 years.

Write us for information that will enable you to get exactly the right fertilizer for your needs.

FEEDING FARM HORSES

The feeding of our farm horses is one phase of live stock production that is not given the consideration which it deserves. This is especially true of the horses that are kept idle a part of the time during the winter months. Too often they are compelled to hustle for themselves and as a result they are not in shape to withstand hard work when spring work opens. The annual cost of keeping a farm horse is another factor that is too often overlooked and the ration that has been used has not been worked out on a basis of economy and efficiency. On the other hand, the feeder of the horses is about as important a factor as the amount of food allowed and the combination that has been worked out. A good feeder watches the individual animals under his care. He knows when they are doing well or when they are off color and seem to lack the "spirit" which every lover of good horse flesh likes to see in his horses.

The horse is no exception to the rule of all farm animals, namely, that of requiring a certain amount of food nutrients to keep up the body weight and to provide the necessary energy for work.

These nutrients must be supplied in the proper proportion to furnish them most economically. The maintenance requirements which amount to fifty per cent of a full ration, must be supplied before there is anything available to be turned into work. Thus can be seen the importance of a well balanced as well as a ration with sufficient quantity to meet the needs of the horse. If the horse is not given enough to meet the needs of his body requirements and the amount necessary for the work which must be performed, the horse will lose in flesh and become thin.

The ration to feed the farm horse will depend to some extent on the feeds at hand and the type of work which the horse is performing. The feeds available for farm horses consist of three general types of groups; namely, roughage, concentrates and succulence. The amount to be fed of each of these feeds will depend upon the season of the year and the character of the work that is being performed. Horses that are idle or doing light work can as a rule secure more of their nutrients from roughage or bulky feed than horses that are performing hard work.

The two chief concentrates used for feeding farm horses are corn and oats. Bran and barley are also used to some extent depending upon the price at which these feeds can be secured. None of these feeds with the possible exception of oats, are satisfactory concentrates when fed alone. Oats alone very near meeting the protein and carbo-hydrate requirements of the horse and at the same time provide a considerable bulk which is not secured when corn is fed. When oats are scarce and high in price, it is possible to work out a very satisfactory ration in which other grains are used as a substitute for oats. When oats of good quality can be had in abundance and the price is reasonable, it is difficult to secure a concentrate that is relished to a greater extent by the horses, or can be fed with greater safety.

The addition of a small amount of oil meal not to exceed one pound per day, can often be fed to advantage, especially at this time of the year. The addition of this small amount of oil meal to the ration has a very

Puts Horses in Prime Condition

Most horses will work if they feed right. When you have to force them, something is wrong. No horse feels right when worked hard on warm spring days unless his heavy winter coat is clipped. Spring clipping is the best protection against colds, stiffness and more serious horse ailments. It pays big, and progressive farmers do it with a Stewart No. 1 Ball Bearing Clipping Machine. Price \$14 at your dealer's, or we ship direct on receipt of \$2 and you pay balance on arrival. Guaranteed to please or money back.

Bigger Wool Crop

The wool is an important part of your sheep profits. Get it all. Hand blade shearing leaves 15% of the wool crop on the sheep, besides an uneven fleece that won't bring best prices. This Stewart No. 9 Ball Bearing Machine shears quick and clean, leaves no ridges. Quickly pays for itself, even on a few sheep. \$22 at your dealer's, or buy direct from us, sending \$2 and paying balance on arrival. If your flock is large, write for Catalog No. 69 of power shearing machines. **Chicago Flexible Shaft Company** Dept. AB 149 5800 Roosevelt Road, Chicago

Grow Hogs and Poultry on Buttermilk

Feeders are ever on the lookout for ways of growing better hogs and poultry, and growing them more quickly and economically. Experienced feeders will tell you that nothing has ever been found as better than good, rich buttermilk, but it has been almost impossible to get enough buttermilk to supply a regular part of the ration. This objection has been overcome and a process worked out for the concentrated production of buttermilk. Nutrients of successfully condensing buttermilk without products, called Semi-Solid Buttermilk, is shipped to hog and poultry growers all over the country, from factories located in different sections. It contains nothing water to Semi-Solid Buttermilk you get a real buttermilk which, being rich and easily absorbed, and which is a tonic and conditioner as well as a feed. Feeders of Pennsylvania Farmer interested in reducing feed costs and at the same time securing rapid growth and keeping their stock healthy, should get this product. For free sample and booklet containing valuable information about this buttermilk and feeding for profit, write J. H. Neiser & Co., No. 3 Chestnut St., Dept. 3512, Philadelphia, Pa. Consolidated Products Co., Dept. 3512, Philadelphia, Pa.

valuable physiological effect on the bowels and helps to restore condition to horses.

Corn makes a very acceptable substitute for oats in the ration. As a rule, it is economy to feed corn in addition to oats for the best interest of the horse as well as greater efficiency from the ration. When corn is fed it must be properly supplemented with a protein feed to balance the ration. Much of the feeling among farmers that corn is not a good horse feed is due to the fact that it cannot be fed alone with good results. The thought that prevails some places that corn cannot be fed to horses during the summer because it is "too heating" is on account of it being fed alone as the grain feed. Corn must be fed in combination with such feeds as oats and oil meal or cottonseed meal or bran and one of the protein supplements alone. A ration made up of nine parts of corn and one part of cottonseed meal makes a very satisfactory grain ration for work horses. Another combination that may be used in eighteen parts of corn, one part cottonseed meal and one part oil meal. When oats and corn are fed a satisfactory combination is one made up of six parts of corn, six parts of oats, and one part of the protein supplement. Bar corn is the best form in which to feed the corn as the horses seem to relish it more in this condition than any other form in which it can be fed. When ear corn is not available, shelled corn or coarse crushed or ground corn can be fed to advantage.

Bran can often be fed to advantage when used in small amounts in combination with other feeds. When used in a ration of corn, oats and a protein supplement, it should not form more than twenty per cent of the ration. Bran is used a great deal as an occasional feed as "bran mash." In places where horses are performing heavy work this combination is usually fed Saturday night. The bran should be moistened enough to make it flaky and a small amount of salt and ginger added.

Barley may take the same place that corn holds in a ration, but it should be crushed or rolled before it is fed.

The type of roughage to feed will depend upon the quality. The amount to feed will depend upon the kind of roughage and the work which the horses are performing. In city stables, the hay in greatest demand is timothy. This is due to the fact that it is usually free from dust and not too rich in protein and as a result can be fed without much danger of injurious effect from such feeding. On most farms, the common hay is mixed timothy and clover which makes a desirable hay if of good quality. Clover hay or alfalfa hay may be fed if of good quality and fed with judgement. When a legume hay is fed the grain allowance may be made up of feeds higher in carbo-hydrates than when timothy hay or mixed hay is fed. Horses that are not performing hard work can be supplied with a portion of their roughage in the form of good clean old straw or good clean corn stover.

Slilage of good quality, free from mold of any kind, can be fed to advantage, especially during the winter. It is desirable to limit the amount allowed to from ten to twenty pounds per day, depending upon the size of the horse. The amount of grain and roughage to allow daily will also depend on the size of the horse and the work to be performed.

A Word for The New International Manure Spreader

THIS year you will be planning with extra care. Extra acres and extra bushels must add their share to your profits. You will seek out new economies, and they must not be false ones. It is no year to be penny-wise and pound foolish.

In this connection you will be wise to build up your crop yields with an **International Roller-Bearing Manure Spreader**. Put good manure on your fields, finely, evenly, uniformly, economically, and the extra fertility will respond by paying for the International and leave it free for other years of crop building.

Note again these features in International construction: 1. Roller bearings at seven points. 2. Power delivered from both wheels. 3. Double ratchet drive with six feed speeds. 4. Short turn front axle; no pole whipping. 5. Rear wheels track with front wheels. 6. Tight bottom. 7. Two beaters and widespread spiral. 8. All-steel main frame.

The New International in its first year (1920) could not cope with the great demand for it. This year—place your order early, and rely on the constructive economy of the rolling-bearing International. See the spreader at the International Dealer's or write the Chicago address for information.

Your crop cost will be low

MAKE your land yield more pounds of grass or more bushels of corn per acre. Make the output per man greater. That is the way to grow your crops at low cost.

The certain way to insure large yields of best quality, which means low production cost, is to supply the crop with plenty of available plant food.

Swift's Red Steer Fertilizer will do this.

It is made from carefully selected materials, both organic and chemical, and furnishes available plant food from seeding to maturity.

Swift's Red Steer Fertilizer is evenly mixed and thoroughly cured. It supplies each plant with its proper proportion of plant food, thus insuring largest yields.

Liberal applications insure biggest crops of best quality.

For more than fifty years Swift & Company has maintained a reputation of making each Swift product the best of its kind. Three new factories were built by us last year to keep pace with the growing demand for Swift's Red Steer Fertilizer.

You can get Swift's Red Steer Fertilizers from the local Swift dealer or our nearest Sales Division. Don't delay—order and haul now.

Swift & Company, Dept. 13

(Fertilizer Works)

Baltimore, Md. Cleveland, Ohio

More per acre

Every acre must be made to yield its best to secure satisfactory profit.

It takes a certain number of bushels of corn or pounds of tobacco per acre to pay for the cost of production. All over this quantity is practically clear profit.

The average application of fertilizer per acre is larger each year because more and more farmers are learning that heavier applications pay them the biggest profit.

Your safest way to insure profits is to use a liberal application of Swift's Red Steer Fertilizers containing 14% or more of plant food.

Are You Using Your Home Market?

A Timely Discussion of an Opportunity Frequently Overlooked by Many Farmers

THE FARMERS and fruit growers of this country will long remember nineteen twenty as one of the most difficult selling years ever experienced. A year that in the beginning, apparently held every opportunity for good financial returns has turned into a nightmare. I believe that, in the spring of nineteen twenty, most people felt that there would be a splendid market for practically everything that could be produced.

With the war over and a world shortage of food, the only problem seemed to be one of production. Every factor that entered into the production of a pound of food was costing an abnormal price but the demand seemed to be so great that the question of over-production was never thought of. The result was that practically everyone planted as heavily as possible regardless of cost. Again, weather conditions during the first half of the year seemed to indicate that the shortage would be more acute than we even anticipated. Most growers will remember the early part of nineteen twenty as very unfavorable to crop production. The outlook was so black that late in the spring we had a regular wave of agitation urging increased production of all food products to meet the alarming shortage. Thousands of acres of vegetables of all kinds were planted late in the season by people who had no idea of planting when spring opened.

All at once everything seemed to change. The crops which looked so poor started to grow over night and kept on growing until very late in the fall. Instead of not having enough to eat, the problem was to dispose of the surplus. Thousands and thousands of tons of food were plowed under and left to rot in the fields and still there was no outlet for what was left.

On top of this over-production, we started to hear rumors of slack times. The consumers started to let up in buying. Foreign exchange went to pieces; Europe needed food (and still needs it) but had no money to buy. Conditions have gone from bad to worse until today our consuming public seems to be satisfied with practically everything that the farmers have produced. Theoretically, consumption should increase on all the cheapest food products but my experience has always been that the reverse is true. I have frequently noticed that as soon as any particular commodity becomes glutted, as soon as the markets fail to clean up from day to day, consumption drops off at once. The consumer seems to tire of that particular article and look for something else. This is especially true at the present

time. The cheapest commodities on the market today are apples, potatoes and cabbage and they are the things which are moving slower than anything else. These three things are abnormally low in price but they are not in demand. The receipts of these products have not been heavy during the last month but still the markets have been dull and have failed to clean up.

When the vegetable and summer fruit market had become completely demoralized, the apple men were getting ready to face the same disaster. Pennsylvania had one of the largest and most expensive crops ever produced. She used unusually high-priced labor, packed the apples in the most expensive packages ever bought, is storing them under advanced storage rates and, to cap

much will they have for their year's labor, but how much will they be compelled to lose on the nineteen twenty crop.

I do not believe in being a "calamity howler;" there isn't anything wrong with the country and as soon as everyone gets over the fear of falling prices, they will start to buy and then times will revert to normal. I really believe that if a small number of manufacturers had nerve enough to advance prices, we would see a change in short order. It doesn't benefit us to "cry over spilled milk" unless in the crying we learn not to spill it again—which brings us to the subject of this article, "Are you using your home markets?"

I have always been a firm believer in supplying the home market first. I have usually realized higher prices with less expense than I could have secured by shipping to the larger markets.

Of course, in some sections, there are no home markets but with the extended use of the truck and the telephone, there are very few growers in Pennsylvania who cannot reach a local market. I have tried all phases of home marketing—selling at the orchard, huckstering to the consumer and selling to the nearby retailers and commission men—all with very good results.

In the fruit business, selling direct from the orchard has wonderful possibilities and very few men in Pennsylvania have developed this method of marketing to its full extent. Furthermore, it is a phase of fruit marketing which is going to develop tremendously in the next few years. Any man, growing good fruit, can, with a little judicious advertising, develop a good retail trade in practically all fruits. There is a certain fascination for city people in buying their fruit direct from the orchard. I have seen them empty peaches on the floors of their machines and even put them in bags, as you would potatoes, simply because they wanted the fruit direct from the orchard, regardless of the condition it would be in when they reached home. The majority of this trade wants good fruit altho there is a certain class that prefers the cheaper grades and in that case it is a splendid way to dispose of all soft or over-ripe fruit. This retail trade takes up considerable time but is decidedly worth it.

To my mind, however, the greatest opportunities along this line are in the development of a truck trade.

Former Secretary of Agriculture Meredith Receiving a Testimonial of Appreciation from Scientists of the Department at a Farewell Reception

the climax, is shipping them at the highest freight rate in history to a market that is dead as far as apples are concerned. The result of these conditions is that the question facing most farmers and fruit growers today is not, how

it is not at all uncommon for dealers to send their trucks forty to fifty miles for good fruit. I think this is the most satisfactory method of disposing of all kinds of fruit. Here you can (Continued on Page 10).

Arguments in Favor of a State Fair

Leading Farmers and Stock Raisers Are All in Favor

THE following letter was sent out by the Secretary of the Pennsylvania Federation of Holstein-Friesian Clubs and shows the attitude taken by representatives of some of the leading livestock men of the state and reasons for their belief that a State Fair would be of great benefit to all agricultural interests in Pennsylvania:

Dear Sir:—The effort to establish a State Fair in Pennsylvania and thus place the livestock and agricultural interests of the state on an equal footing with similar interests in adjoining states, New York, New Jersey and Ohio has crystallized to a point that a bill has been introduced in the Legislature, creating a State Fair Commission to take preliminary steps for the establishment of a State Agricultural Fair.

This bill has the support of Governor William C. Sproul, Hon. Fred Rasmussen, Secretary of Agriculture, and the various allied agricultural associations in the state. At the annual meeting of the Pennsylvania Holstein-Friesian Association, of the Pennsylvania State Association of County Fairs, held at Harrisburg on January 27th, 1921, a resolution was passed favoring a State Fair and the officers of the various local clubs through the state requesting them to get in touch with the Senator and Representatives of their various districts asking them to support the measure when it comes up for consideration.

It has come to my attention that certain officers of the Pennsylvania State Association of County Fairs are opposed to the establishing of a State Fair on the grounds that it will absorb the interests now being taken in local fairs and have a tendency to lessen or cut off entirely their state appropriation for premiums. The assertion is made that in the State of New York, the State Fair has practically put the local fairs in that state out of existence. In answer to inquiries as to the conditions in the state of New York, I am pleased to submit the following letter signed by the Commissioner of Agriculture.

"I feel that the statement that a State Fair will put the local fairs out of existence, is not well taken and is not true in the case of New York State. I believe that the Genesee County Fair, at Batavia, had the largest attendance in its history last year. They have recently bought a tract of land adjacent to their grounds and are contemplating putting up new buildings to meet this increased attendance. I believe this has been true of most of our county fairs.

"The state appropriated \$250,000 for the county fairs in this state, which is supposed to reimburse them for premiums paid out. They paid out, however, last year something like \$75,000 in premiums above the amount appropriated by the state. The State Fair has not detracted from the interest in the county fairs but, on the other hand, has greatly added to the interests of the county exhibitions. Our junior project work, among the boys and girls of the different counties, carried on thru the Farm Bureau, coming together at the county fair and later at the State Fair, has done much to increase interest in both county and state exhibits.

"The advertising campaign put forward by a successful State Fair, by arousing interest and attracting attention helps to advertise all of the county fairs. The benefits from the premiums offered at the State Fair for encouragement in raising better crops and breeding better cattle, extend into every county helping greatly to encourage such exhibits at the county fairs.

"I am giving the above as a few of the reasons why I believe that the State Fair does not detract from the county fairs, but rather adds to their interest. As a matter of fact they become interdependent one upon the other. The county fairs act as feeders, we might say, for the State Fair and the State Fair becomes an advertiser for the improvement of rural conditions, better breeding, etc." (Signed) George F. Hogue, Commissioner of Agriculture.

The above letter sets forth very clearly what is being accomplished in New York State in an educational way by close co-operation of the local fairs with the State Fair. Pennsylvania's live stock and agricultural interests can never hope to be on an equal footing with the adjoining states until it takes advantage of the educational opportunities to be derived from well supported state and local fairs. We must have adequate appropriations to establish a State Fair, and additional funds to pay premiums at local fairs. Now is the time to get behind the movement. House Bill No. 452, File Folio 1837, creating a State Fair Commission was referred to the appropriation committee on February 9th, 1921, and may be reported out at any time.

I would ask that you be prompt to get in touch with the Senator and Representatives of your county and ask them to vote favorably on this bill.

Trusting that I may have your co-operation and prompt action in this matter, I remain, Respectfully yours,
(Signed) Howard C. Reynolds, Secretary.

That county fair officers are not all opposed to the establishment of a State Fair is shown by the following letters received from Mr. R. B. McDuff, County Agent of Lackawanna County, Pa., and from Mr. Norris G. Temple, Secretary of the Chester County Agricultural Association:

Dear Sir:—After having received letters both favoring and discouraging a State Fair the following resolution was adopted at a regular meeting of the directors of the Lackawanna County Fair. Resolved: That we go on record as favoring the formation of a State Fair and that we exert our effort to secure larger appropriations for County Fairs.

You have probably already received a letter from Secretary H. C. Reynolds, of the State Hol-

stein Association showing the status of the state and county fairs in New York State. We believe that Pennsylvania agriculture would further prosper if like steps were taken in this state, and we believe that those interested should see their legislators and ask for legislation to create a State Fair and to increase appropriations for county fairs.

Very truly yours,
(Signed) R. B. McDUFF.

The letter from Mr. Temple is as follows: My Dear Editor:—I was much pleased to read the editorial in your issue of last week commenting on the action of the State Association of County Fairs at their meeting in Philadelphia at Green's Hotel on the ninth.

This association has always stood for the good of county fairs in general, and largely thru its influence the various fairs of the state have received their state aid from year to year, and I believe if some of these county fairs had been conducted on the square, less trouble would be experienced from time to time in obtaining the appropriation. The set of resolutions adopted at the meeting on the 9th, was adopted but not unanimously; there were two and perhaps more who voted no. The county fair of which I am secretary had early in January of this year adopted a set of resolutions favoring a state fair, and directing that our Senator and Representatives be requested to use their influence to aid the passage of such a measure. We believe the time is at hand when the State of Pennsylvania should come out and set aside a sum of money to foster a state fair. This action should not in any way interfere with the annual appropriation to county fairs if they conduct their fair for the pro-

motion of agriculture and allied interests. I am your friend,
(Signed) NORRIS G. TEMPLE.

Mr. H. M. Knox writes as follows concerning the state and county fairs in New York: It has interested me to see the progress of the movement for a state fair for Pennsylvania as promulgated by Pennsylvania Farmer and your editorial of February 19th is of especial interest. I am a New York state man and my business takes me to the State Fair of our state and many county fairs. For the last decade I have been in attendance at our New York State Fair and so have had a chance to see the operations of the state and county fairs. It is as the "Farmer" says, if the Pennsylvania Fair Association had looked to New York state or Ohio they would never have opposed a state fair.

We consider in New York State that our State Fair at Syracuse is just a big parent to the smaller fairs. The success of the county and local fairs are in a measure as that of the State Fair. Our State Fair brings out the premier stock of land. The most modern agricultural machinery and equipment, the best products of the state, the most recent developments in the agricultural world are shown and demonstrated. In brief, it is a wonderful school—a school where you can spend a few days or a week and get in touch with the very best and most recent developments in the agricultural world.

Now, what bearing does this have on the local fairs? It only makes the interest keener in local fairs, I believe. Very few local fairs are held during the State Fair week so people can arrange to visit their State Fair and at the same time promote their local fair. Our State Fair was the best ever, last year, and I can say the same of the local fairs.—H. M. Knox.

SWAT THE RAT

The Public Health Service at Washington estimates that for every person in the United States there also exists at least one rat. Rats cause damage in the United States which amounts to the vast sum of \$200,000,000 annually.

A little figuring will reveal that, according to the above figures, it costs \$1.67 per annum to feed and shelter each rat and this is a very conservative estimate. Rats begin breeding at the age of about four months, have from six to ten young at a litter and will have several litters a year. Judge for yourself what the result will be if left undisturbed for a considerable length of time.

The rat is not only a destroyer of food and property but is also a carrier of disease germs and a menace to health. San Francisco spent approximately a million dollars to exterminate the rat in its fight against the plague.

To fight rats with any degree of success we must refuse to feed and harbor them. That is, we must have everything rat-proof as far as possible. Solid concrete floors and walls are a deterrent to the inroads of rats, but board or earth floors and open drains and sewers are just to their fancy. Ofttimes, owing to force of circumstance, the rats are already firmly entrenched and for various reasons we cannot rebuild or remodel; then the only recourse is to fight.

There are three chief methods of ridding a place of rats; poison, ferrets and traps. There are several rat poisons on the market besides such poisons as arsenic and strychnine. They all have the disadvantage of being dangerous to stock and children and must be handled very carefully. Ferrets are claimed by those who use them to be very efficacious. As to traps there are many different kinds but most prefer the old reliable steel trap. Use plenty of them and set them where rats are known to be.—H. A. C., Montgomery Co., Pa.

Tile Silo on Worth Brothers' Farm, Chester Co., Pa.

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

SEED MIXTURE FOR SUMMER PASTURE

What would you advise as the best mixture of grains and grasses to sow early on last year's corn land, for summer pasture for cows for only one season. The soil is a good quality of sandy loam and I would like to have it for early June pasture. The land seems well adapted to sweet clover and I intend using a liberal quantity of it in a mixture.—C. C., Eastern Shore, Md.

C. C., Eastern Shore, Md.—A suitable mixture for your conditions would consist of:

Oats 1 bu. per acre
Spring vetch (vicia sativa) } " " "
Canada field peas 1 " " "
Red or alsike clover ... 3 pounds
Sweet clover. 10 " " "
Alfalfa 5 " " "

This mixture may be sown as soon as the land is properly fitted in the spring. Preparatory to seeding down, it would be desirable, if the field had not been limed for three or four years, to use either ground limestone or burned and slaked lime. The former may be employed at the rate of about two tons per acre. If the latter is used, the application should be equivalent to about one ton of freshly burned lime per acre. Previous to application it should be thoroughly slaked. After the lime is well worked into the soil, a fertilizer mixture consisting of 300 pounds of acid phosphate, 75 pounds of nitrate of soda and 25 pounds of muriate of potash may be used at the rate of 400 pounds per acre. This would be equivalent to the same quantity of a 3-12-3 fertilizer.

MORE DAYLIGHT SAVING OPINIONS

Mr. C. P. Kibbler, president of the Fruit Growers' Association of York County, speaking of daylight saving legislation and its effects on farming operations, recently said:

"The farmers are some of the most important men in existence. Cut off the food supply and humanity will soon be extinct; investigate any line of business, it either originates or terminates on or thru Mother Earth, cut off the farmer and the wheels of industry will cease.

"As to the origin of the proposed daylight saving law organization of New York city, accusing the farmer of not being willing to accept this proposed law from a selfish motive, there is a misconception as to the attitude of the farmer.

"I will venture to say the gentleman who made this assertion don't know the first letter of farming as the average bred city man does not realize or know what the farmer must endure, to supply the city man with the necessities of life. He does not realize that the farmer and his wife who live fifty and more miles away from the city are in the cow stable at four o'clock in the morning drawing the milk from the cows, and in many cases make a four or more mile drive thru the cold rain and mud to the railroad station in order that the city man can enjoy good fresh milk the

same day, while the city man in many cases is in bed on the broad of his back and will turn over and heave a sigh and say the farmer is selfish and not satisfied with present conditions. Many city folks propose to legislate to compel the farmer to get up in the morning at 2 and 3 o'clock.

"The daylight saving is detrimental to all branches of farming. The farmer's best time to hoard his crops is from 9 o'clock in the morning to 8 P. M. in the summer months, due to the fact the hay and grain as a rule are wet in the morning with dew and cannot be handled until dry. The only advantage obtained from the daylight saving is to the city man who will have more time for pleasure at the expense and disadvantage and inconvenience of the man who provides his daily bread. Unless the city folk and business people give the farmer more recognition some one will go hungry. Statistics show that there are

Don't Change the Clocks

Mr. Backus contends that the only reason the farmer has for opposing daylight saving is that he must meet early trains, whereas the farmer has numerous reasons.

A certain amount of sunshine is required to dry the dew on the vegetation before he can begin the most of his field operations; also the farmer has to put up with hired labor which is at times very exacting. On the other hand the daylight savers are narrow because they want to force conditions (which are unfavorable) on the farmer simply to further their own ends, in fact only to give them a longer evening for pleasure, which is alright as long as no one else suffers thru the change. They are childish because they want to change the clock thereby fooling themselves into thinking that six o'clock is seven. I have never heard of a farmer who opposed any one starting work an hour earlier. He only asks that they let the clock alone.—C. S. Backman, Bucks Co., Pa.

I do heartily agree with the article written by C. C. Hulsart on the proposed daylight saving law. Why should the city people have the power to tell country people when to start work? Many farmers are getting up at 4 o'clock in the morning to do their work and meet that train to the city with milk and other products.

Now they want to tell these farmers to get up at 3 o'clock in order to meet that train. We do not tell the city business men when to open and close their places of business. They can do as they please. It is not a matter of daylight saving, but one taking advantage of daylight.

Let the people who want daylight get up at 4 or even at 5 o'clock and start to work, then by working eight or ten hours they will have plenty of leisure.

The sun is up early, so let the people get up early, too. The farmers do not wish to make it inconvenient to every one in the city. Let city people use their daylight to best advantage and permit the farmers to do the same.

W. E. Backus of Pittsburgh in one of your recent issues, criticized farmers for being childish. What would the city people do if all farmers would be childish enough to miss all trains and send no products to the city?—A. H. Gerhart, Berks Co., Pa.

Work Fewer Hours

I have read and heard discussed as well as cursed, most everything concerning the daylight saving law and the main thing which the majority object to is, not getting another hour or two of work out of the hired help. Now I want to

say right now that I own a farm and work at farming as hard as anyone, but I still fail to see where the daylight saving law has hurt the farmer. Last year my man worked on the new time and when the whistle blew he quit for the day, leaving me to work the rest of the night if I cared to or was foolish enough to.

Now I did work a goodly number of hours after the whistle blew to pay the man and feed the other fellow who knew enough to quit and have a little time to himself.

At the end of the season this county had produced such a surplus of potatoes, cotton, wheat, corn, oats and milk, etc., and had allowed other

		and " " " " " " " " " " " "
95 "	Ammonium Sulphate 21 percent N.	
129 "	Nitrate of Soda 15.5 percent N.	
143 "	Nitrate of Potash (This am't also contains 63 lbs. potash).	

To furnish 1% of Phosphoric Acid in one ton of fertilizer requires:

75 lbs.	14—60 Bone	27.5% P.	This am't also contains .9 lbs. of N.
87 "	3—50 "	23.0 " " " " " " " " " " " "	2.1 " " " "
145 "	2—30 "	13.75 " " " " " " " " " " " "	2.4 " " " "
71 "	S. C. Phosphate Rock	28.00% P.	
62.5 "	Tenn. "	32.00 " "	
117.0 "	Basic Slag	17.00 " "	
143.0 "	Acid Phosphate	16.00 " "	
125.0 "	" "	14.00 " "	

To furnish 1% of Potash in one ton of fertilizer requires:

40 lbs.	Muriate of Potash 48% K.
43 "	Sulphate of potash 46 " " " " " " " " " " " "
166 "	Kainit 12 " " " " " " " " " " " "
45 "	Nitrate of Potash 44 " " " " " " " " " " " "

When a fertilizer company or manufacturer quotes a fertilizer formula as 4—8—2, he means that it contains four percent of ammonia, eight percent of phosphoric acid, and two percent of potash. On the other hand the experiment station worker means four percent of nitrogen, eight percent of phosphoric acid and two percent of potash. Ammonia and nitrogen are two different substances tho the former contains nitrogen. Either method may be followed if the difference is understood. In other words it must be remembered that there is only 1/2 of a pound of nitrogen in a pound of ammonia and the difference of 1/2 of a pound is hydrogen which has no value as a fertilizer.

In the same way phosphoric acid in ground bone is often quoted in terms of bone phosphate of lime. For instance a 3—50 pound bone contains 2.47 per cent of nitrogen and 22.9 percent of phosphoric acid.

The following table gives the figures by which one may be expressed in terms of the other.

To convert the guarantee of:	Multiply by:—
Ammonia into an equivalent of Nitrogen,	.8235
Nitrogen into an equivalent of Ammonia,	1.2140
Bone Phosphate, into an equivalent of Phosphoric Acid	0.4580

over four thousand farms idle in Pennsylvania. Your hear the daily remark that farmers are going to grow what they need, and let the rest look out for themselves. The farmer has been furnishing your daily bread for years, at a loss.

"The statistics are, the average and actual cost of the production of a bushel of wheat is \$2.15 per bushel, and sells today for \$1.50 and \$1.65 per bushel. With the exception of the last few years wheat was selling from 80c to \$1.50 per bushel. The wheat is grown at the expense of some other product of the farm. Were it not a necessity to grow wheat as a routine to obtain straw, hay and keep the farm in good condition no wheat would be grown from a financial view."

Entered as second-class matter at the postoffice at Philadelphia, Pa., under the act of March 3, 1879.

I have come to believe that a blow struck a child is far wickeder than any wickedness a child can do.—William Dean Howells.

To Allow Gambling

WE HAVE had an intimation that a bill is to be introduced into the Pennsylvania Legislature to exempt county fairs and carnivals from the state anti-gambling law. It scarcely seems possible that any member of that body would risk his reputation, whatever it may be, even to introduce such a bill, to say nothing of urging its passage. While we have little fear that such a measure would be enacted if introduced, still the mere suggestion indicates the length to which the leaches on public body would go if they had a chance, and the extent to which the managers of some of the organizations named now permit or wink at the open violation of the anti-gambling laws indicates plainly what might be expected if given legal sanction. Are the so-called county agricultural fairs and the small-town money-making carnivals to be allowed to violate further the moral sentiments of their localities by legalizing immoral practices? We think not.

Starving Armenia

THE FARMERS of the country are called upon to respond to the Lenton Sacrifice Appeal which the Near East Relief organization is making in behalf of the still persecuted people of Bible lands. Resolutions of sympathy and of co-operation were adopted by the National Grange in its meeting at Boston, December, 1920, by the Farm Economic Association at its convention at Washington, D. C., on January first, by leaders of the National Board of Farm Organizations, American Farm Organizations, American Farm Bureau Federation, Farmers Educational and Co-operative Union of America, National Milk Producers' Federation and other national organizations as well as by many state and local farm organizations. All urge that local granges, farm bureaus and other organizations give this relief work hearty support and co-operation. Senator Arthur Capper, in accepting a chairmanship on the Committee for the Appeal, has already led the way.

At this season it is most fitting that every man and woman and child in our land of Peace and Plenty who calls himself Christian, should make some sacrifice, however small, for these stricken Armenians, over a million of whom have given their lives in loyalty to their Faith and two hundred thousand of whom are yet homeless and hungry, dependent entirely on American charity for their existence. Contributions may be

Pennsylvania Farmer

sent to the National Headquarters at 1 Madison Avenue, New York City, or to the state or local office.

Tariff Bill Vetoeed

AS WAS expected President Wilson vetoed the Fordney tariff bill which was passed by Congress for the ostensible purpose of "relieving" agriculture from severe losses during the period of deflation. From the first we have had little faith in the efficacy of the measure and still less faith in the intentions of some of the politicians who were backing it. While this particular tariff bill is dead, tariff revision in general will come up in the special session and farmers may then get a glimpse of the roon in the woodpile.

Because of the exaggerated importance which some farm leaders attached to the necessity for a special tariff bill we quote part of the reasons given by President Wilson in his veto message:

"This nation has been for very many years a large exporter of agricultural products. For nearly a generation before it entered the European war its exports exceeded its imports of agricultural commodities by from approximately \$200,000,000 to more than \$500,000,000. In recent years this excess has greatly increased and in 1919 reached the huge total of \$1,904,200,000.

"The excess of exports of staple products is especially marked. In 1913 the nation imported 733,481 bushels of wheat valued at \$70,931, and in 1920 35,848,648 bushels, worth \$75,398,834; while it exported in 1913 99,508,968 bushels, worth \$95,098,338, and in 1920 218,280,231 bushels, valued at \$56,957,769. In the year 1913 it imported 85,183 barrels of wheat flour, valued at \$347,877, and in 1920 800,788 barrels, valued at \$3,669,300; while it exported in the first year 12,278,206 barrels, valued at \$56,865,444, and in 1920 19,853,952 barrels, valued at \$24,472,448. In 1913 it imported \$3,888,604 worth of corn, and in 1920 \$9,257,377 worth, while its exports in the first year were valued at \$26,515,146, and in 1920 at \$26,453,681.

"The situation in which many of the farmers of the country find themselves cannot be remedied by a measure of this sort. This is doubtless generally understood. There is no short way out of existing conditions, and measures of this sort can only have the effect of deceiving the farmers and of raising false hopes among them. Actual relief can come only from the adoption of constructive measures of a broader scope, from the restoration of peace everywhere in the world, the resumption of normal industrial pursuits, the recovery particularly of Europe and the discovery of additional credit foundations on the basis of which her people may arrange to take from farmers and other producers of this nation a greater part of their surplus production."

"What the farmer now needs is not only a better system of domestic marketing and credit, but especially larger foreign markets for his surplus products. Clearly, measures of this sort will not conduce to an expansion of the foreign market. It is not a little singular that a measure which strikes a blow at our foreign trade should follow so closely upon the action of Congress disallowing the resumption of certain activities of the War Finance Corporation, especially at the urgent insistence of representatives of the farming interests who believed that its resumption would improve foreign marketing. Indeed, when one surveys recent activities in the foreign field, and measures enacted affecting the foreign trade, one cannot fail to be impressed with the fact that there is consistency only in their contradictions and inconsistencies. We have been vigorously building up a great merchant marine and providing for improvement of marketing in foreign countries by the passage of an export trade law and of measures for the promotion of banking agencies in foreign countries. Now it appears that we purpose to render these measures abortive in whole or in part."

It is an interesting coincidence that President Harding should have expressed somewhat similar sentiments on the tariff question in his inaugural address. He said:

"Today, as never before, when peoples are seeking trade restoration and expansion, we must adjust our tariffs to the new orders. We seek participation in the world's exchanges, because therein lies our way to widened influence and the triumphs of peace."

One of our reasons for questioning the expediency of the Fordney tariff measure was that it opened the way for charges that farmers favored special tariff legislation, the facts to the contrary notwithstanding. Farmers are not interested in the academic theories of either high or low tariff policies, but they are rightly interested in receiving the same consideration as is given other industries. They object to the principle which would throw food production into compe-

tition from which manufactured products are highly protected. Farmers have always opposed the establishment of special privileges by any kind of special legislation. With the Fordney bill vetoed they can now enter the coming tariff fight with free hands.

Our Washington Letter

Large delegations of representatives of the dairy and creamery industry from the leading butter producing states, were in attendance on the hearings before Internal Revenue Commissioner William M. Williams, relative to the proposed Treasury ruling on so-called adulterated butter. The ruling declares that all "butter made from decomposed or rancid cream, which has been neutralized with chemicals before churning, or from cream which is high in acid and has a bad odor, and which has been neutralized with chemicals before churning is adulterated butter, and is subject to a tax as such at the rate of ten cents per pound, under the act of 1902." The creamery butter manufacturers and dairy interests generally in the Middle West outside of Minnesota object to this ruling which unless withdrawn will become effective April 1. Appearing for their constituents several senators and congressmen from the Middle West made vigorous protests against the ruling, saying that it was their belief that the ruling would destroy the creamery, and dairy industry of several states, including Iowa, Nebraska, Kansas, Oklahoma, Colorado and the southern states.

The Muscle Shoals nitrate proposition, endorsed by the farmer organizations, and advocated by all of the recognized friends of the farmers in Congress, was the source of a bitter struggle between the Senate and House in the closing hours of the session. The Senate was determined that the \$10,000,000 appropriation for the dam at Muscle Shoals should go thru with the sundry civil bill. The House leaders were as strongly determined that this proposition should fail.

In considering agricultural legislation it is found that it is much less difficult to get favorable action in the Senate than in the House. This is due to the fact that the great agricultural west is more powerful in the Senate, while the Industrial East has a stronger representation in the House. New York state has forty-three congressmen; fourteen Western states have forty-three congressmen. New York outvotes Wyoming three congressmen. In the Senate, the advantage is with the West. These four Western states have twenty-eight senators to New York's two. New York, Pennsylvania, New Jersey and New England have 123 congressmen and eighteen senators, while the nineteen states west of the Mississippi River have 117 congressmen and thirty-eight senators. These figures indicate that the farmers might profitably devote more attention to the attitude of the congressmen they vote for to represent them in Washington.

The decision of the United States Supreme Court in upholding the Federal Farm Loan act and the validity of the exemption of bonds of the Federal Farm Loan banks and joint stock land banks from taxation, was very gratifying to the Washington representatives of the big farm organizations. The case had been pending in court for several months during which time the land bank system has been at a standstill.

Members of the Federal Farm Loan Board say that the decision clears away every legal question and removes every shadow of doubt as to the legality of the banks or their bonds. The announcement is made that there will be an immediate issue of farm loan bonds to finance the loans already approved by the board and held up pending the decision of the court.

Both the Federal land banks and the joint stock land banks are preparing to resume active business just as soon as the necessary arrangements can be made. Commissioner Charles E. Lobdell is quoted as saying that "it will be at least thirty days before funds are available for actual loaning."

It is believed that this decision will have a wholesome effect on the agricultural situation. Efforts will be made to secure amendments widening the scope of the Farm Loan act, making it more efficient in providing means of financing the farmers. It is well known however that the act has some influential enemies in Congress and that who if any attempt is made to revise the act will do their best to get thru some "jokers" that will wreck the entire system. It will require close watching on the part of the farm representatives and the farm press to save the Farm Loan act and the farm system from being wrecked. If the when Congress begins tinkering with it. If the farm loan system is wrecked, an advocate of the plan says it will not be because of any weakness in the Farm Loan act, and not because of any failures in the functioning of the farm loan system, but it will come because Congress and the general public have not been adequately informed as to the nature of the business in hand, much less as to details of procedure.—E. E. Reynolds.

HARRISBURG LETTER

Short Session After All.—Decision of the Legislature to adjourn finally on the last Tuesday of April illustrates how session after session of the Pennsylvania general assembly has been extended until midsummer simply because men in party authority were unable to make up their minds on just what should be passed. The present Legislature was elected in the midst of much discussion of a program and the preliminaries were made interesting by talk of "a short and business-like session" but when the organization came and there were mutterings of factional strife the plan to fix a definite date was put into the icebox. The Governor and his advisors could not see why a date should be set in January, but after Senator Boies Penrose put down his foot on some legislative projects and the administration cut loose its program everyone here went back to the original idea of "a short and business-like session" and concurred on April 28 for adjournment. The State will get a short session, the shortest one since 1909, but up-to-date has not been business-like and it will require considerable effort to get thru the routine matters of a session in eight weeks remaining from today. It will be more of a scramble for appropriations and a seeking for opportunities to slide thru other legislation. It seems to be certain there will be no new taxation measures to speak of and that various ambitious governmental plants will be trimmed or abandoned. It is to be noticed that the State Highway Department, which has been importuned by people all over the state to build roads, has been very careful to get its legislation in early and by the middle of next week it will be in the Governor's hands. Some other departments of the state government have not yet sent in their bills.

State Fair Involved.—Adoption of this policy by the state administration is regarded with some apprehension by advocates of a State Fair. The bill to establish such an enterprise has been prepared after consultation with a number of interested persons and while the amount has not been definitely fixed it will be ample to provide a site and buildings. The State Fair enterprise already has enough trouble without being involved in a wholesale cutting of new projects and retention of old ones. There are half a dozen cities contending for it and some towns have announced selection of sites, while the people interested in various county and other fairs have been sharpening up their scythes. A formidable lobby against the fair has been started and the friends of the bill will meet them.

Daylight Saving.—Legislators from the cities and larger towns, especially industrial centers, on the other hand, have been hard at work in the interest of daylight saving bills. There have been no hearings on the matter, but instead just a series of movements which indicate the bills have support in influential quarters. The bills being pushed are similar to the New York law.

Paying Cattle Claims.—The deficiency bill having enabled the State Department of Agriculture to provide the funds to meet cost of animals killed to prevent spread of disease or owing to tuberculosis the Bureau of Animal Industry has sent thru 256 claims, involving 1175 head of cattle. The state pays \$70 for thoroughbreds and \$40 for grade cattle. The vouchers have been made out and audited for weeks, the Bureau having been forced to mark time because of the fighting over the deficiency bill.—Hamilton, Harrisburg.

NEW YORK LETTER

Road Repairs.—Increases in auto license fees next year will be 15 per cent on pleasure cars, and very much more on heavy commercial trucks. The raise will mean about \$3 for a small car, \$9 for a big one and 25 to 30 per cent on heavy tonnage trucks. The aim of the new administration is to make license fees pay for state road upkeep and on this basis the fees must total an increase of \$2,500,000.

Farmers and Hunters Seek to Compromise.—A conference of representatives of these interests was called

in Albany this week. Sportsmen wish to eliminate all requiring of a written consent of owners of lands before hunters or fishermen can enter. Farmers may have to concede some of their demands which have been clear cut in an effort to reduce loss from sportsmen's activities. The latter thru their organizations are making vigorous protest of the Bettis bill which would protect the farmers.

Its Own Restored.—State control of the barge canal is about to be returned by the Federal government. So far the huge expensive waterway has been of little value to the country. From now on private corporations will be allowed to develop a service worthy of the great transportation medium, which is greatly needed.

Milk Plant to Close.—The Kohler Chocolate Company of Fulton will close thru April, due to surplus stocks. It will leave Fulton dairymen in very bad shape.

Garden Truck Exchange.—Syracuse and central New York vegetable growers are studying plans to develop a big, year-round garden truck exchange to sell produce at retail and on commission. The old market is outgrown and inconvenient. Sometimes 300 rigs are registered, and a big trade is assured from the start.

NEW JERSEY NEWS

Daylight Saving Bill.—Owing to the fact that there are quite a number of members of the State Senate who hail from rural counties, it is indicated that the Eldridge Daylight Saving bill, which has passed the House after much opposition by the farmers' representatives, will be fought on the floor of the chamber of the Upper House soon. Agriculturalists of high standing in New Jersey have shown to the legislators that the measure will cause much hardship and loss to the farmers of the state. The measure, realizing the vital situation, will no doubt go slow in voting in favor of the bill.

Railroad Tax Increases.—The total increase in taxes that railroad companies operating in New Jersey will be compelled to pay for the present year in comparison to last year amounts to \$1,843,701. The final assessment of the property has been filed with State Comptroller Bugbee by the New Jersey Board of Taxes and Assessment, which shows a total increase in valuation of railroad property in the state over the 1920 assessment of \$17,950,507. As a result of appeals made to the board by the companies, there were total reductions in valuations of \$936,961. The assessment shows a total valuation of first and second class property for 1921 of \$390,229,488, while in 1920 it was \$372,248,981.

Cream Adulteration Bill.—Holstein breeders in New Jersey thru their state association are urging the passage of a bill in the present Legislature prohibiting the use of animal fats and vegetable oils as substitutes in the manufacture of ice cream. The measure calls for at least eight per cent of milk fats in the delicacy unless nuts, fruits or eggs are used, and then, there must be at least six per cent fat. It is said that ice cream is a very nutritious food because of the fact that it has always contained milk fat.

Breeders wish to protect their product from a few unscrupulous persons, who are charged with trying to use cocoanut oil as a substitute for cream, and it is hinted that thru amendments this has practically come about.

Farmers Talk Advertising.—Declaring that not only the workingman but every class in this country have a share in paying the taxes made necessary by the world war and explaining a number of important points in national and local taxation, Dr. H. W. Kemmerer, of Princeton University, delivered an enlightening address before the Mercer County Board of Agriculture at the annual meeting of the board here, W. S. Barnhart, Mercer County agricultural agent, stated in a talk that the raising of better and more crops to the acre and the possibilities of another farmers' market in the near future featured the activities of the organization of the farmers in Central New Jersey at the present time. Other topics discussed were the value of newspaper advertising and legislation.—Kelly, Trenton.

Look-a-here, says the Colonel,
Your Paint is Wrong—
And then He Proved It

By jimminy, if he didn't show me how it rubbed off white on his fingers. He told me at least three reasons why that paint, or any paint like it, wasn't worth a hoot. I'd like to tell you exactly what he said, but it's a bit too long a story to tell right now.

But you will find it all, and a lot more that's good to know about paint and painting in The Happy Happening Book. There are things in it also that the "women folks" ought to know and like to know. Send 10 cents for it. Write to this name and address:

"Dockash" The Steel Range

which has a place in every farm home. These ranges have many features you should know about before deciding on the purchase of a stove or range.

Ask your dealer about the steel "Dockash" or write us for a description.

For 55 years "Dockash" has stood for quality, workmanship and improvement, none of which have ever been sacrificed for price. The best is the most economical in the long run. It pays to buy for service—"Dockash" will give it.

No matter for what purpose, you will find in our line something to suit you.

SCRANTON STOVE WORKS, Scranton, Pa.

Giants in Strength

Craine 3-wall Silos

are as strong as they are handsome. And give ideal silage protection because of the triple-wall construction. Inner wall is closely fitted upright staves—an ordinary silo in itself. Your old stave silo can be used for this wall, saving expense.

Second wall is heavy Silafelt, to keep out rain, frost and air, safeguarding the silage.

Third wall is Crainelox spiral covering, winding up to the top. Protects and reinforces every inch of wall. No unsightly hoops or lugs to adjust and worry about.

The Craine Silo is a permanent building that pays rich interest every year on the investment. The strongest, handsomest silo made—and we can prove it. Write today for literature, free, and for agency terms.

CRRAINE SILO CO.
Box 140 Norwich, N. Y.

Rebuild the Old Stave Silo

Anytime made of stave silo, if covered, tipped or collapsed, can be rebuilt into a beautiful, new Craine 3-wall silo. Material cost only \$1.50 per sq. ft. of material except hoops. The hoops, sent for our plan of rebuilding old silos.

Breeding Up The Dairy Herd

IT IS doubtful if it pays to buy a purebred bull before one has a herd of cows that possess the characteristics needed to withstand heavy milk production. Increased production at the pail creates increased demands upon the animal's body, and unless the progeny of the purebred sire inherit the essential vigor along with the inherited tendency to produce more milk, they are sure to prove poor property. Breeding for increased milk production is a comparatively easy problem compared with maintaining the vigor necessary to accompany the enlarged productive capacity. Too many dairy farmers keep a herd of weak-looking cows in the hope that the heifer calves will inherit the necessary vigor from the sire. The upbuilding of a herd of efficient dairy cows depends upon the careful selection of cows with good constitutions quite as much as upon the use of improved blood.

In the first place we must have cows with great digestive capacity. What we call a big, wide muzzle and roomy body are indications of digestive capacity. Cows do not eat at first. They fill up, and then chewing the cud is eating. Animals that eat bulky foods have larger digestive tracts and by the law of correlated parts they should have large mouths. They must have much storage capacity. When the food has been chewed, then returned to the second stomach, and further digested, it must be taken into the blood; that demands a long digestive coil. A great storage capacity and a long digestive coil cannot be inclosed in a small body. That is plain enough.

Given a herd of grade cows that possess the essential vigor and great digestive capacity together with the ability to produce from 5000 to 6000 pounds of milk per cow per year, and a purebred sire from a line of dams and grand dams who have produced from 8000 to 10,000 pounds of milk per year, and it is comparatively easy for one to raise the average production of the herd up to from 6500 to 7000 pounds of milk per year. It is reasonable to expect that such a male of good productive ancestry would in a single generation put the owner in possession of a lot of uniform and vigorous heifers. The results from mating grade cows with a pure bred bull can be better ascertained by raising most of the strong and well developed heifer calves. It is not enough to raise the calves from only a few of the best cows. Larger numbers are needed to work with so that one can make better selections to retain in the herd for milk production and breeding purposes. A calf from some cow that is only an ordinary producer may turn out to be a better cow than the calf from some much better cow. The first generation of heifers will possess one-half of the blood of the purebred sire. If he is a vigorous animal it will be quite safe to breed him to his own daughters. In this way the first sire will put his owner in possession of a lot of uniform cows to form the basis of a profitable working dairy. The advantage thus gained should be

maintained by the use of other good sires.

When another bull is selected he should come from some family of similar breeding and from a line of heavy producing cows. With a herd of cows producing from 6500 to 7000 pounds of milk per cow it is difficult to increase the average and greater care must be used in selecting the new sire. When an average production of 8000 pounds of milk per year is reached further increase is slow and uncertain. A fact which illustrates the importance of selecting a better head for the herd that has already been brought up to the higher standard of production.

The herd that has been bred up to an annual production of more than 8000 pounds of milk per cow per year will quickly drop below such figures if the management is not right. It is not enough for a dairy farmer to bring his herd up to the goal of bumper production. He must hold them there once they have attained such a standard. He must study the pedigree of every sire purchased, note the production of his dam and dam of his sire. The two nearest female ancestors in the pedigree should be good producers, and there should be as many more good producers as possible. The bull is likely to reproduce his good qualities in his progeny according to the number of good females that are close up to him in his ancestry. That is to say, that some good ancestor several generations back is of little value unless the intermediate animals are good. It has been fully demonstrated that domestic animals get an average of 50 per cent of their inherited characteristics from the sire and dam. This gives 25 per cent from each parent. Going back one generation, it is found that the grandparents contribute half as much to the animal as the two parents. On this basis 25 per cent comes from the grandparents, as 6 1/2 per cent from each. Studying the pedigree of the prospective sire along these lines will give one a pretty good idea of the inherited dairy qualities from the milk producing standpoint.

Individuality is as important as pedigree in selecting a purebred sire. He should be a true representative of his breed and have a vigorous constitution. It is always safer to use a tried sire than to depend on a young bull and trust in luck. It is an unwise and dangerous policy to depend upon young and untried sires. Nothing can be told of the bull's breeding powers until some of his heifers come into production and it is regrettable that so many good bulls are sacrificed when their time of usefulness is just beginning, while so many young, immature animals, that ought to have been vealed, are allowed to sow their seeds of degradation in our herds. The sire that demonstrates his ability to get good calves, that develop into good cows, should only go when his power as a breeder is at an end.

The failure of many dairy farmers to succeed in the effort to grade up their herds is due principally to the fact that after seeing the great

improvements brought about by the first cross and attaining with the second cross much less improvement than with the first, they have abandoned all further attempts to grade up. The first cross of the purebred sire on account of his superiority over the cows with which he was mated showed far greater results. He exerted far more than one-half of the influence upon the progeny. While in the first cross there is existing a wide difference between the quality of the purebred sire and the quality of the grade dam, when it comes to the second cross the difference between the purebred sire and the half breed dam is much less and the cross of the three-quarter breeds will show smaller improvement. In this way many dairy farmers are apt to conclude that it is hardly worth while to pursue these lines of breeding any further, if they are not to attain sufficient results and right here is where they make the mistake of losing all of the improvement they have already made. The results are being attained and as rapidly as possible, but are less apparent from year to year. If the breeder stops the grading up process before the improved blood has become permanently fixed in his herd the revision to the original type becomes rapid indeed.

Cattle of mixed breeding cannot be depended upon to reproduce their equals. A man might select a herd of twelve cows of inferior or mixed breeding that would average up well with ordinary grades or purebred cows at a much less expense than a like herd of better bred animals, but it is right here that breed and breeding become of great importance to the dairy farmer. Such a herd of mixed breeding might be really profitable the first few years but as it becomes necessary to replace some of the older cows or those that are disposed of for many reasons, the cow of no particular ancestry back of her, gives no assurance that she will equal or excel her dam in productive ability. Here is where the dairy sire of well-known qualities and prepotency can be depended upon to give strength to the blood lines and help to bring about the desired results of improvement. When a farmer has a crop of half-breed calves, the appearance of these calves will very largely show the effect of the sire on their breeding, and of those kept for use in the dairy, one or two years' milking will determine whether they are valuable for breeding purposes and by breeding the half-breed heifers to a purebred male of superior quality a few crosses will place the owner in possession of a herd that for dairy purposes is nearly as good as the purebreds from which the first cross instituted.—W. Milton Kelly.

AYRSHIRE BREEDERS ORGANIZE

The Ayrshire Breeders of McKean County, Pa., on Feb. 14, 1921, organized the McKean County Ayrshire Breeders Association, their constitution and by-laws embodying such clauses as "to become a member one must place his herd under the state and Federal supervision for the eradication of tuberculosis" and "any member willfully misrepresenting a purebred, for the purpose of a sale, will upon sufficient evidence be expelled from the association." The number of reactors in the county have been .8 of 1%. This exceptionally low percentage, the ideal dairying section, the well-bred heifers and bulls, together with the enthusiasm shown will truly make history for Ayrshires in McKean Co.

17,602 Pounds Milk;
850.5 lbs. butter fat
in a year is the
record of this splendid
AYRSHIRE.
Healthy? Of course!

NOTE:—The trademark name has been changed from KOW-KARE to KOW-KARE—a name more expressive of both the PREVENTIVE and CURATIVE qualities of the remedy. There is not the slightest change in formula or manufacture.

You, too, can have record cows

Even though you may not have a single cow in your dairy that can ever hope to approach the mark of a champion, there are nevertheless many opportunities in almost every dairy for greatly increased milk production.

How? Simply by keeping an accurate record of every cow—and working to make each cow BEAT HER OWN RECORD. Milk records are great indicators of the ups and downs of a cow's physical condition. If the milk-making organs become sluggish, you'll soon learn—as others have—that a little prompt attention to health will return dollars for every penny spent.

For toning up and warding off the diseases that attack the organs of production, nothing has yet been found so promptly effective as the Kow-Kare treatment. At slight expense you can insure your cows against disease by its moderate use.

The medicinal properties of Kow-Kare act directly on the digestive and genital organs, making them function normally. Barrenness, Abortion, Retained Afterbirth, Scouring, Lost Appetite, Bunches can be prevented—or successfully treated—by following the simple Kow-Kare home treatment.

Convince yourself by testing Kow-Kare on one cow. Your feed dealer, general store or druggist sells it in 70c and \$1.40 packages.

These Seven Cows

Fed From the Product of One Acre Every Day for Over a Year

64 tons of Ross' Eureka Silage Corn to the acre is the yield reported by Mr. Reynolds, Farm Superintendent of the Worcester State Hospital, Massachusetts. At 30 lbs. each per day, this would feed seven cows for one year and eight months.

Ross' Eureka Corn grows the tallest, has the most leaves, is very short jointed and will produce more tons of good sweet silage per acre, than any other variety. We have been selling Eureka corn for nearly 40 years and we know before shipping that it will grow under favorable conditions. This corn usually germinates 90 per cent, or better.

Ross' Eureka Corn

Complete line of Farm Seeds: Oats, Rye, Barley, Wheat, Buckwheat, Cow Peas, Vetch, Soy Beans, Sweet Baze, all varieties of Field and Pasture Grass, Grass Seeds, including all kinds of alfalfa and Sudan Grass. Also full line of Agricultural Implements, Fertilizer, etc. Our 120-page catalog mailed free on request.

An Easy Way to Remove Afterbirth

If you want your cows to be healthy and productive, by all means see that the afterbirth comes out in a natural way, for the infection will injure the animal's health if you don't.

The best way to get rid of a retained afterbirth is to let B-K promptly reduce inflammation, suppress infection, destroy foul odors, soothe and heal torn tissues and permit the afterbirth to come away without assistance.

If treatment is given promptly, the case will respond at once. If delayed, infection advanced, foul odors present, etc., then the first two or three applications should be stronger.

Your cow will not be injured or torn in any way, as she will be if you try to remove this afterbirth by the unnatural hand method. B-K prevents infection and leaves no part to decay. Write us today to ship you a gallon.

Built Better·Last Longer Do Better Work

ESPECIALLY designed for the farms of the East and made of good materials specially treated for strength and long wear, Syracuse plows have been, for the past 50 years, a vital factor in Eastern farming. They are built better, they last longer, and they do better work.

JOHN DEERE SYRACUSE WALKING PLOWS

There is a type of Syracuse Plow to fit your every plowing condition. These plows are the result of years of study and experiment with the many types of soil found in different sections, and are designed to meet and overcome your plowing difficulties.

General purpose plows for hard, dry or gravelly land; hillside

plows on which the bottom swivels, permitting you to turn your land all one way; plows with flat bottoms, specially adapted to sticky soil; these plows are made for you in the Syracuse line. They may be had in a variety of bottoms, such as full chilled or full steel, or a combination of both chilled and steel.

You can inspect the Syracuse Plows at your John Deere dealers. Be sure and see them. Write us for a folder describing them. Also ask for "Better Farm Implements," a book of 114 pages, illustrating and describing the complete line of John Deere tools. It's free. HORTICULTURE

Horticultural Queries By J. P. STEWART

ONE of the signs of spring appears in the annual quickening of interest in fruit and vegetable problems. The following list of queries indicates that we are attaining "normalcy" in this respect at least.

Black Knot on Plums

I have a German Prune Plum tree which has the black knot which is often found on plum trees. Will you please tell me the cause of this disease and how to control it.—C. F. B., Cumberland Co., Pa.

This disease is caused by a fungus which goes by the sonorous title of *Plowrightia morbosa*. It attacks both the plum and cherry, in both wild and cultivated forms. It spreads from one form to another by means of tiny, microscopic spores. These spores are of two kinds, first, the summer spores, which are produced abundantly during the late spring and early summer; and second, the winter spores, which are discharged from special structures on the mature knots during the period from January to June, the exact time depending on the locality. The attacks may become so serious as to kill the whole tree.

The only satisfactory method of control is to seek out and destroy all evidence of the disease in the locality. This should be done before any of the new crop of spores are disseminated, which means that the best time to conduct the campaign is in the fall or early winter before January. Look over all the susceptible trees in the locality carefully, and prune out and burn all the knots found.

Altho it is now too late to get the maximum benefit from this course this year, yet even now it is the best course to follow, and it can be repeated next fall to catch any new infections that may appear. In a serious case, this course may well be supplemented by spraying with Bordeaux mixture (4-4-50), making the first application late in March, and repeating it three or four times at intervals of about three weeks, except on the Japanese varieties which are likely to be injured by this spray after they have come out in foliage.

Apple Varieties for Northwestern Pa.

I have a cherry orchard of Montmorency and Early Richmonds. Every other row was planted to peach trees. This last fall I pulled the peach trees out and would like to plant apple trees in their place. Could you recommend one or two good varieties for this section of Pennsylvania which if planted alone would not need to be cross pollinated. Our cherry orchard is of quite large size and I do not want to mix in a lot of different varieties of apples.—J. W. B., Erie Co., Pa.

According to our observations, the Rome Beauty has done at least as well in the locality concerned as any other apple. The Baldwin and Northern Spy have been planted fairly extensively there also, but the first is too susceptible to the "pit" disease which occurs thru the flesh; while the latter is too slow in coming into bearing, and is also rather susceptible to fungus troubles in the damp lake atmosphere. As another late apple for that locality, I would sug-

gest the Stayman Winesap, and for fall and early winter varieties, would suggest the Wealthy, and possibly the McIntosh if the spraying is well done.

Asparagus Growing and Fertilization
Would you please print in your valuable paper how to raise and fertilize asparagus.—R. H., Franklin Co., Pa.

The raising and fertilization of asparagus is a rather large order for the space at our disposal, especially if the inquirer expects to go into the business extensively. As a home-garden proposition, the requirements are not so exacting but the results will of course be better the more nearly right the work is done. The soil generally preferred for this plant is a deep, rich, moist, sandy loam, altho alluvial soils are also good. Other good soils may of course be used, but in any case stony soils should be avoided.

It is customary to start the asparagus plantation in a soil in which other vegetables were grown the year before, but some growers prefer a good clover sod. In either case, the soil should be thoroughly pulverized to the full depth of the plow furrow before planting. Disking thoroly, both before and after plowing, is one of the best ways of accomplishing this.

The bed is started with the so-called "crowns," which are fleshy-rooted plants, preferably one year old. These crowns can usually be purchased locally at a reasonable rate, but when this cannot be done, they can be developed from seed. The richest garden soil should be chosen for this, and the seed should be sown as early as possible in the spring, in rows at least 15 inches apart if they are to be worked with a wheel hoe, and at least thirty inches if to be worked with a horse. The seeds germinate so slowly that it is very common to sow radish seeds of an early variety in the same row, so that cultivation can be started as early as possible. The young plants are usually fertilized with a top-dressing of nitrate of soda applied either broadcast or along the rows, at the rate of 100 pounds to the acre and repeated at frequent intervals during the first season. This application should not be made so as to strike the plants when the young plants are moist, as it may cause burning under those conditions.

The plants should be set in rows about four feet apart and from two to three feet apart in the rows. They should be set at least six or eight inches below the general level of the soil, preferably in the bottoms of furrows, and be covered lightly with dirt until they show thru, the furrow being gradually filled up as the young plants grow tall enough to avoid being covered. Formerly trenches were dug to a depth of about two or three feet, into which large quantities of manure were placed before planting the crowns, but this has been found unnecessary and has been largely abandoned at least in this country. Subsoiling before planting has also been largely abandoned for the same reason. The crowns

should not be set so deep as to get below the good soil, but they should have considerable depth of course, in order to reduce danger of injury in early cultivation or in cutting the edible stalks.

In the matter of fertilization, it is customary to give a new plantation very liberal feeding. Many growers use as much as 800 pounds per acre of a high-nitrogen fertilizer, such as a 6-8-5, soon after the plants are up, making the applications along the rows, and this is supplemented by top-dressings of nitrate of soda at the rate of around 100 pounds per acre at intervals of about three or four weeks thruout the first season. Well-rotted manure is also greatly prized the first year at least, when it can be obtained. A similar treatment is commonly followed the second year.

After cutting is started, a good fertilizer program is to apply about 800 to 1000 pounds per acre of a 6-8-3 mixture early in the spring before growth starts, and repeat immediately after the last cutting. At latter date also apply around ten tons of fine manure, if available, between the rows. This is commonly supplemented with about three applications of nitrate of soda of about 150 pounds each making the first as soon as growth starts in spring, the second about when cutting is half over, and the third about a month after cutting closes. Such fertilization is likely to be pretty expensive until the present readjustment in prices is completed, but a good asparagus bed will come as near paying dividends on heavy fertilization, under normal conditions, as any crop that we have.

TRIMMING CURRANT BUSHES

We have three thousand currant bushes which need trimming every season. If there is no heavy snow on the ground, the work can be done before spring. It is a lot of work and requires more time than we like to take. Therefore, we think we have developed time saving methods. In trimming we use the regular 8-inch California pruning shears. There are no set rules for doing the work. I take two of my best men with me and go at it. The first thing is to clip off nearly all the branches that lean out from the hills. All dead wood is removed. From six to a dozen old canes are left together with six to ten of the new growth. Everything else is cut out as close down as possible. The brush is laid in small piles between the rows so that it can be picked up quickly and carried out to be burned.

As the work progresses, I show the men how to remove the dark colored wood as it is the oldest. They are told that the two-year-old wood is the most productive; three-year-old wood is fairly productive while four-year-old stuff is worthless and one-year-old strong canes are a necessity. We usually spray our currants only once a year and that in the early summer to kill the currant leaf-eating worms. However this season there seems to be quite a general infestation of the scale. That means a dormant spray with concentrated lime sulphur. The mixture will be one part of concentrated lime sulphur with nine parts of water. We will drive along each side of the field with the power sprayer and spray with Pilot spray rods and long hose which is capable of withstanding a high pressure. The trimming and dormant spray will be completed as soon as possible so as to get that work out of the way.—R. W. De Baun.

Titan 10-20—for Economy Farming

DURING THE YEAR 1921
AND THE YEARS TO COME

TRACTORS come and tractors go but Titan 10-20 continues its steady traveling along the roads of popularity, and in the fields of labor, conquering the most difficult of practical farm tasks.

Theories and experiments in design and construction run their course among manufacturers and among farmers—and leave behind a varied history. But the service record of Titan has been a revelation in the agricultural world. Its record as an efficient farm power unit has been, to state a plain truth, convincing.

During its history, Titan sales have swept ahead; this tractor has carried its success into every county and country. Yet, except for minor improvements and betterments, Titan design has remained unchanged. It has stood the test of time, the test of hardest, roughest usage, the test of strenuous competition, so that to date the farming world has invested over seventy million dollars in Titans. Can there be better proof of thorough practicability?

Titan 10-20 is now more than ever standard because it is fundamentally simple, enduring, reliable, right. Do not be deluded by initial false economy. Increase the efficiency of your work for 1921 by an investment in this power. The International dealer is the man to see.

IRON AGE

What Father Thought An Expense Son Makes An Investment

A MIDDLE WESTERN FARMER tills the same acreage that he, his brother and father used to farm. And he makes *more* money.

His father used the implements others throw away—unknown makes—for which repairs were hard to get or unobtainable. To him, farm implements were an expense—one to keep small. The son buys *known* tools—the best. He believes that implements to a great extent determine his profits—that implements are an *investment*.

This year farm profits will depend largely on production costs—hence on implements. Before investing, the careful farmer will ask: "Does

the tool mean better, faster work—is it dependable and durable?" Sixty-eight years' experience has served to answer these questions correctly in E-B line of farm tools. In these, your investment is protected. Every E-B tool is made to work when needed, to last many years, to lower production costs—facts attested to by farmers everywhere.

Close study of the farmer's needs has taught us *what* to make—sixty-eight years' experience has taught us *how* to make it.

make reasonably large sales with no extra handling, and know exactly what the price is going to be.

The huckster method is undoubtedly the most satisfactory of all methods for the small growers of fruit and vegetables. Here the grower gets the one hundred per cent dollar instead of the thirty-five per cent dollar of the shipper. If careful attention is paid to the handling of nothing but strictly first-class produce, which is displayed in an attractive manner, it is very easy to develop a big trade along this line. At least ninety per cent of the hucksters of today are using boxes, barrels, baskets and crates of all descriptions to display their produce, with the result that not more than half of it can be seen and this makes an unattractive appearance. I used this method of marketing largely for quite a number of years and found that appearance counted for more than fifty per cent in selling. The greatest objection to this method is the time required to sell a large quantity and it is out of the question for really large growers.

I have also tried marketing by parcel post and I think my experience

majority of my retailers for a number of years and have gotten to know their requirements so that I can frequently ship both fruit and vegetables for a couple of weeks at a time without bothering about orders.

We simply pack so many bushels of the different fruits and vegetables for each man, put on the price and ship two or three times a week as he may need it. In the rush season, I try to get in to see the dealers every week or two so as to see how things are moving and to collect the bills. The man who has never marketed direct to the retailer will possibly think it rather difficult to fix the prices without being on the market every day but I have never found any difficulty along that line. Here, however, you must be fair and I have always made it a rule that no dealer shall lose money on produce thru any fault of mine. In other words, if the market breaks on a certain commodity, and I am billing it too high, my dealer don't call me up and tell me stop shipping but simply sells at the market price, knowing full well that he is not going to lose money. This I believe, is very important and it is really surprising how few reductions must be made.

Again, be sure and take care of your regular trade. Frequently, certain dealers will pay an abnormally high price for something when it is scarce and next to nothing when it is plentiful. These are good men to let alone. I believe in supplying my regular men first at all times and give the surplus to the other fellow. The result is that we seldom have any surplus.

When your outlet is large enough and where it is possible to handle the marketing in this way, I think it is the ideal method. Your returns are always larger because you are saving on cartage and last but not least you can get back practically all of your carriers at a very small cost; this has been quite an item during the last several years.

The above method is quite advantageous to the retailer as well as to the grower. He knows just what to expect from week to week and can tell his customers when to look for the different fruits and vegetables in their prime.—Sheldon W. Funk.

Puff Ball Measuring 2 ft. 3 in. the Long Way and 6 ft. 6 in. in Circumference

has been about the same as that of others who have tried it. With the greater number of products, the cost is too high, not only the cost of mailing but the expense of packing in so many small packages. Then again, there is great damage in transit and the shipper is dealing with too many people whom he does not know.

In marketing vegetables and berries, I have found the most satisfactory method to be direct to the retailer. To my mind this method has advantages over any other used. The first requisite, of course, is a first-class article. It is necessary to get a certain reputation with the men who are handling your products. They must have confidence that your goods are going to come up to a certain standard and then it is very easy to sell large quantities of fruit and vegetables with very little soliciting. This method can be handled by a truck or by trolley freight. I have used it extensively and always with splendid satisfaction. Where trolley freight is available I find it to be a little cheaper than the truck and it also possesses several other advantages. I have been dealing with the

TOMATO GROWERS AND CANNERS MEET

At a meeting called by the State Federation of County Boards of Agriculture at Glassboro, N. J., February 19th, which was attended by 19 prominent tomato growers, members of the Tomato Committees of the county boards of agriculture in the tomato growing counties, and 16 canners, representing the large tomato canhouses in the state, the sentiment was expressed that the canhouse tomato situation was in very bad shape.

Many of the canners still have the major portion of their entire pack of last season on their hands. The price of canned goods is less than the cost of the pack to the canner. In some cases, if the tomatoes were given to the canners for nothing they would not much more than pay their cost at the prices of the market at the present time. The canners were unanimous in the expression of the bad year they have just had, and many will have to take heavy losses if the market for canned goods does not improve.

"even when there is no fungus"

WHEN buying a spray material, consider that fungous diseases cause more damage than insects. Consider further that it pays to spray with a copper fungicide even when there is no fungus.

AT the Vermont Agricultural Experiment Station, the average increase for 20 years of spraying potatoes with a copper fungicide was 105 bushels per

acre. During five years of the twenty there was no blight. Yet for the five no-blight years the copper fungicide brought an average increase of 63 bushels per acre.

You need a poison insecticide to kill bugs and worms—a strong one.

You need a fungicide to control fungous diseases—a powerful one.

Pyrox Combines Both. Moreover, Pyrox foliage is a richer green; the plants are sturdier, stronger, more vigorous. This helps to increase the yield, even when there is no fungus! Remember that, when you choose your spray material. Select Pyrox because it is more than a strong poison; because it is more than a powerful fungicide; use it because it helps to produce a profit even when neither bugs nor disease prevail.

Pyrox is easy to use—just mix with water, and spray. It is so creamy, smooth and fine it does not clog the finest spray nozzle. It sticks like paint, stays on for weeks in spite of rain. Convenient size packages for every need.

Remember—Pyrox is a preventive, not a cure. Therefore buy it early and spray early. See the dealer and reserve your Pyrox. Write for new illustrated Pyrox Book which tells how to spray fruits and vegetables for profit.

Ready for All-Around Work On Any Size Farm

Study the work of this little tractor. See whether it does not give you the logical, practical answer to the power problem on your farm. We sincerely believe it to be the biggest success ever offered in a small tractor.

Here's dependable power in small size—quality construction at low cost—a complete power plant that can put speed and economy into practically any kind of farm work. It can be used profitably on any size farm. Besides plowing you can hitch it to your disc, harrow, grain drill, mower, blower, manure spreader or other machines and finish your work in much less time and at lower cost than with animal power. Also runs a small thresher, silo filler and other belt machinery.

One owner says: "We have never required the service of any of our service men and the little tractor has done everything for us. We are pulling what we consider a good six-horse load and seem to have plenty of reserve power."

It is built complete in the Avery factories. Has

POULTRY

GETTING RESULTS FROM THE INCUBATOR

Each spring as the hatching season comes near I try to sum up the successes and failures of the past years, and endeavor to see where I failed and the reasons for my success. In early years of artificial incubation I recall that many of the failures were due to faulty construction of the incubators. It is a far cry from those days, back in the early 90's, to the modern incubators that hatch by the thousands. Then an oil-heated incubator with a capacity of 250 eggs was looked upon as a mammoth machine.

The incubators capable of hatching out from 80 to 95 per cent of the fertile eggs are as numerous now as the automobiles that can give the owners 16 miles to a gallon of gasoline. Of course, these figures are the ones given out by the makers. In my own experience—going back over a number of years—I can recall that the hatches over 80 per cent were scarce as compared with those under eighty.

I have become convinced that a large hatch is not always to be desired. Frequently, I have had hatches that would have done credit to any make of machine, but the seasons of high hatches were not always the most successful from a financial standpoint. For my part I would prefer to hatch out from 60 to 70 per cent of good, strong chicks than from 80 to 90 per cent that start out in life handicapped with weak constitutions and the numerous ills that beset young chicks. I have come to the conclusion that it is not how many chicks one hatches out early in the season as the number one can "shoo" into winter quarters as pullets in the early fall.

There are many types of artificial incubators on the market today—large and small, hot air and hot water, with single and multiple compartments. If they are operated according to directions which are sent out with the machine, practically any one of them will prove satisfactory. Many poultrymen, particularly beginners, try to improve upon or ignore the directions and they fail as a result.

A chick that comes out of the shell on time, with lots of life, that duffs up in a few hours and gets on its feet and takes an active interest in things around him is the only kind worth bothering with. The weakling among the baby chicks will not pay for coddling and will not earn money for the owner.

A strong chick will never hatch out of a poor egg. The breeding stock that produced the eggs must be strong, carefully selected for vigor and constitutional strength and be well mated. A weak male will never produce good chicks. A few dollars spent for a strong male bird will have a lasting effect upon the chicks for that season. There is still plenty of time to add a good male bird to your flock before the hatching season begins on most farms in this section.

Care of the hatching eggs is necessary. I have known hens to do their work properly, and yet the poultryman was to blame for a poor hatch. I make it a rule to gather the eggs

regularly and often, particularly in cold weather. I never allow hatching eggs to become chilled. It is essential to keep all nests clean, for a dirty, fouled egg will result in a poor hatch. Fresh eggs hatch best. I never hold an egg over two weeks, and very seldom that long. The eggs for hatching are carefully selected, for it does not pay to waste time and oil on a lot of freak eggs simply because they are gathered from the breeding pens. As a rule, a good, large egg will produce a good, large chick, while an undersize egg will result in a small chick. I carefully avoid the extra long or narrow eggs.

After the incubator is filled with good-sized eggs I follow the instructions of that particular make, always bearing in mind that conditions vary in various parts of the country. The moisture supply is an important part of operating an incubator. Some machines have moisture trays, and these should be used according to the directions. Moisture keeps down evaporation from the eggs and keeps the shell in good shape. The air in the incubator cellar or hatching room should be kept moist at all times. I have had good results from sprinkling the eggs every morning after cooling and just before returning them to the incubator. Use warm water and be sure to wet the eggs well. This can be continued until the machine is closed for the last time. Be sure to chill carefully and never take a weak chick out of the incubator.—A. J. Bradley.

ARTIFICIAL LIGHTING FOR LAYING HOUSES

I have read quite a bit in your notes on poultry about artificial light for laying hens. We began the experiment in January, 1921, sometime between the first and 15th. The results have been very satisfactory up to the present time. When we began we were getting from 25 to 30 eggs a day, now we are averaging over five dozen a day and yesterday and today got 69 each day. We only have 90 pullets of the Barred Rock strain. Can any of your readers beat this record. Since Feb. first to the present date (Feb. 24) we have gotten 1420 eggs from the 90 pullets and I think we have had from one to three up to change their minds about setting all the time. We think we are consistent with the hard times as we are selling the eggs at \$1 for 15 eggs for setting.—S. E. H., Dorchester Co., Md.

GOOD LAYERS

In your issue of Jan. 29 you give a report for December of a number of test flocks of pullets under illumination and without illumination and I note the best average per pullet is 13.1. I was rather astonished at this low average compared to what my pullets have been doing, and I feel there must be some conditions not right. I hang a barn lantern in my coop at 5 A. M. and keep an accurate daily record of the number of eggs so will give you the totals and averages per pullet for the month of December and January which were: December 1441 eggs, average 201; Jan., 1223; average, 221.—M. C. R., Armstrong Co., Pa.

The most efficient Tractor in America

Making Bigger Crops with the Bates Steel Mule

THE ability of the Bates Steel Mule to do fast and sure field work in the Springtime increases the crop from ten to thirty percent.

The Bates Steel Mule is built for Spring work, and every farmer who uses horses or less efficient tractors for this work pays for a Bates Steel Mule whether he buys one or not. The sure-footed traction of the Bates Steel Mule allows double disking and harrowing to be done in one quick operation.

The Bates Steel Mule does not pack the ground because of the broad Crawley surface which allows the tractor to rest on the top of the soil as lightly as a child's foot. The heavy duty Bates-Midwest engine is an absolute guarantee of dependable power and the rugged construction will stand the hardest service. Regardless of soil conditions the broad Crawley surface prevents slippage or miring down.

Bates Crawley Shoes have hardened steel parts, and are 100% oversize—that's why they last for years.

The front wheels make easy steering and comfortable riding. The increased knowledge of how much money Bates Steel Mules make for farmers each Spring, combined with the fact that the price of the Bates Steel Mule has been reduced to practically a pre-war basis has caused the demand for this machine to be greater than ever this Spring.

Write today for full information.

PHILADELPHIA OFFICE, 1918 MARKET STREET

COUNTY NOTES

Forest County, Pa.—Had very moderate winter weather the first three weeks of February, the last week was a white one and some very cold nights, but not very good sleighing. Ice crop has been poor so far. Farmers are getting in their season's supply of seeds, fertilizer and lime and are planning for the summer work. Live stock is looking good, some registered cattle is being offered for sale in the county. On Feb. 4th at West Hickory, a Duroc-Jersey Breeders' Association was organized which shall be known as "Harmony Duroc-Jersey Community Breeders' Association," orders have already been placed for eleven sows and one sire. On February 18th County Agent W. Irwin Galt, met with a number of farmers in Forest Grange Hall to discuss dairy prospects in that vicinity with especial reference to purebred cows, and a purebred community-owned bull. The sentiment of those present were to take some quick action toward better stock and they decided to hold another meeting early in March to which everyone would be invited. A winter wheat test is being conducted by the Farm Bureau, on the A. R. Hillard farm, in Barnett Township. Grain prices are about the same as last month: Potatoes, 75c; \$1; apples, \$1 bu.; dressed beef, 13c to 16c lb.; pork, 15c lb.; butter, 50c; eggs, 30c. Not much demand for cows and horses, except real good ones.—C. E. M.

Frederick Co., Md.—Weather unusually mild early part of February, farmers in this section doing much of their spring plowing and hauling manure. Sunday, the 20th, witnessed the first real winter of the season, about 12 inches of snow falling. This was a great help to grass and grain but promises to be going soon as it is considerably warmer. Prices of farm products continue to decline, some feeders selling steers as low as 7c a lb. Hay has no sale at all, local dealers refusing to buy.—R. J. W.

Washington Co., Pa.—Weather has been quite changeable for some time, cold and stormy one day then perhaps warm and wet the next. More snow and real winter in last three weeks than any time yet. Wheat looks slightly better. Clover seed market caused some surprise. Early buyers lost money owing to unusual drop in price.

Farmers hauling feed and manure. Too much feed and to little manure in many cases. Roads in bad shape altho scraping helped some. Very little plowing done yet. Labor prices slowly coming down. Most coal operations shut down but some mines running 3 to 4 days a week. There is little demand for coal. Not much sickness except children's diseases. Looks like the "flu" would miss this year, but never can tell. Many farm sales for March. Farmers restless and some discouraged with conditions. Prices range as follows, veal calves, \$10 to \$13.50; hogs lower, around \$8 to \$9; sheep active, about \$5 for wethers. No wool sold except occasional clips. Hay dull, \$25 for No. 1 timothy, though Pittsburgh quotes No. 1 at \$15; corn, 80c; oats, 45c; 50c. Fertilizer, 16c; A. Phosphate, \$26.—Bruce McNinch.

It is just as profitable, to remove weed trees from the woodlot, as it is to weed the garden; besides you can burn the wood from the crooked, defective trees; and from those that are not good timber species.

This Guarantee Protects You Absolutely

This money-back guarantee of satisfaction takes all the chance out of buying a New-Idea Pipeless Furnace. If you are not satisfied that the New-Idea does what we say it will, your money will be refunded promptly.

It is so stated as plainly as we could write it right in the guarantee.

The New-Idea dealer will show you this guarantee. Read it carefully before you order, but order now for lower prices again prevail. Have him explain also the

Many Advantages

of the New-Idea which account for the low fuel consumption but high-heating quality of this furnace.

Ask him about the

FARM DEMONSTRATION PLANS FARM LABOR—A SOCIAL SURVEY FOR A MARYLAND COUNTY

(Continued From Last Week.)

Cecil County, Maryland, for the year of 1921 is to work with the County Agent for better production of its farm crops, lower costs, and better livestock. The work is to be carried on during the year by members of local organizations with the assistance of the County Agent and with the co-operation of the extension service of the state. This work carried on by the members of local organizations will give greater scope in demonstrations of better agriculture and will therefore, in reaching conclusions, be of greater value than work done heretofore.

The work for the year is to be carried on in the form of demonstrations, the objects of which are briefly outlined below.

Demonstration No. 1—One hundred acres of soy beans to be divided as follows: 60 acres for hay and 40 for seed. The hundred acres are to be divided and worked by ten members selected from a local organization. The seed used will be the Wilson or the Virginian. The amount per acre for hay will be two bushels, using 300 pounds of the best 2-8-2 fertilizer on the market and sowing the plot as near May 15th as conditions will permit.

In growing the beans for seed the same kind of seed will probably be used. The amount per acre will be one-third to one-half bushel sown in rows 28 inches apart.

Soy beans have had a fine start in this county and the outlook is so promising it is thought best to give the culture of them a boost. They are much more profitable than oats. They will grow in a short season, allowing plenty of time for the seedling of wheat in the mid-fall. The experience generally is that increased yields follow a crop of soy beans because of the ability to plant to gather nitrogen from the air and store it in the form of nodules on the roots for the use of other crops.

Demonstration No. 2—Fifty acres of potatoes giving special emphasis to variety tests and control of diseases.

Demonstration No. 3—Crop rotation for the foraging of hogs, using the crops adapted to county conditions and limiting the number of hogs at the option of the demonstrators. The crops to be used are Canadian field peas with oats, rape, soy beans and corn.

The improvement of livestock program includes five demonstrations in the feeding purebred sows. The suggestion is made that each community be pledged to secure five parties who will purchase a purebred gilt and to keep a record of the expense of producing a litter and determine the profit or loss resulting.

Five demonstrations will be conducted in the feeding of balanced rations to dairy herds. In another set of five demonstrations the relative merits of soy beans and mixed hay will be tested out over a reasonable period of time.

This plan of work is one of construction and the community at large will profit by it. The county agent and the State Department of Agriculture stand ready to help all they can to carry thru the work of each organization.—Murray J. Ewing, Cecil Co., Md.

There is no proverb in the whole catalogue of them more true than a penny saved is a penny got.—George Washington.

There is no reason why the experience of industry with shorter hours should not be duplicated to a larger degree in farm labor. The length of a day's work and the amount actually accomplished are by no means parallel. This is perhaps more true on the farm than it is in factory production work. Every farmer recognizes that some men can cover almost twice the ground than others in the same number of hours.

If this is true, the work accomplished is based upon other factors than the number of hours which a man is supposed to put in during the day. The efficiency of the farm depends very directly upon the efficiency of the farm management. If the work is laid out so that there is no lost motion and the man knows exactly what his work is to be, he can accomplish more in a half-day than he could in a full day under poor and inefficient supervision. The proper tools and equipment are often of more importance than the hours of labor. If a farmer would always see that machinery and tools were in proper condition for immediate use before they are put away, he would save many hours of valuable time. There is but little question that the management of a farm can make a difference of from one to two hours a day in the efficiency of the men. This being true, it is not at all unlikely that a reduction in the hours per day would not decrease the productivity or the labor cost of the farm.

It is hard to imagine any work on a farm except the operation of a tractor, where it would not be possible to accomplish as much in nine hours as in ten if the farmhand had the incentive to do so. On some farms there is no work on Saturday afternoon during the greater part of the year. If the farmhand is supposed to do work on Sunday, he should receive half a day at least twice a month, except during the busiest season. This allows an opportunity to go to town and make necessary purchases and enjoy a change of surroundings. The half Saturday holiday has always been a success wherever tried and is very well worth considering. Other farms delegate the Sunday work to the men in rotation so that they may have most of their Sundays free. This is very commendable. It would seem quite reasonable to allow the farmhand a few days each year as a definite vacation after the summer's work is over. If possible he should spend these few days away from the farm. If the length of hours is one of the chief objections of the farmhand to farm labor, then the farmer should use whatever means possible to reduce the hours provided he can secure the same amount of work accomplished per dollar. With labor saving machinery and proper tools together with efficient management, this can be done.

Bonus Plans

Many farmers have given careful consideration to the possibility of profit-sharing and bonus plans. It cannot be said that these have proven successful. The most common form of bonus plan is to pay the man a dollar a week extra at the end of the season, providing he will stay thru the year. There is no objection to this system, providing that it is a real bonus and not taken out of the weekly pay, which is actually need-

Reynolds Shingles

Laugh Today At

GLOBE SILOS

The Choice of Dairy-men and Stockmen Who Investigate

1. Because the Globe Silo with its nearly straight side extension roof insures a silo full and packed to capacity.

2. Because it has a continuous opening adjustable door front, with handy doors that fit tight and open easily.

3. Because its door fasteners form a convenient ladder making use of the silo and tightening hoops safe and easy.

4. Because the double steel spline and cementing method of fastening stave sections to each other, makes an airtight silo, with strong, smooth joints that are supported in every direction, at every point.

Other real, desirable features described in illustrated Catalog. Sales agents wanted. Write TODAY.

The machine that moved the city to the country

JUST a simple little machine for mixing crushed stone and water to produce fuel and light. But what a machine! This marvelous mechanism is known as the Colt Carbide Lighting-and-Cooking Plant.

It brings carbide (crushed stone) in contact with plain, ordinary water automatically. The gas generated thereby makes the hottest cooking fuel known; it makes soft, mellow light that has been called "the chemical counterpart of actual sunlight."

You want this machine, because:

It will take the heat and drudgery out of the summer kitchen by substituting clean carbide-gas for sweltering coal and messy oil. It will put man-made sunlight in every room in the house, barns, outbuildings, drives.

It will give you every advantage of city cooking and lighting wherever you live, and at a cost so low as to be negligible.

There is no waste with a Colt plant. An automatic shut-off control suits the supply to the demand. The residue of the devitalized carbide is slaked lime, valuable for fertilizer or white-washing.

It is easy to install a Colt Machine. The only attention it asks is a small supply of carbide about once a month. And carbide is readily obtainable in every rural community.

Will you let us tell you the whole story of carbide lighting and cooking, as rendered by the simple little Colt machine? Just send us your name and address on a postcard. Take this first step today—without obligation.

TALKS WITH THE BOYS

Building Houses for Our Bird Friends

ONE of the best ways to get well acquainted with birds is to build houses for them. Not all birds will use houses, nevertheless there are quite a number which will gladly accept them. If a bird-lover builds houses for birds and watches their home life all during the summer he will soon come to know Nature better and will be glad that he had the chance to do so. The best time to build bird houses is in winter for they may be put out in early spring and will have an opportunity to weather in which condition the birds like them much better than otherwise.

A common bird which takes very kindly to bird houses is the House Wren, a small brownish bird a little more than four inches long. His house may be made of 3 or 4-inch soft wood. The cavity should be 4 by 4 inches square and about 6 inches

Fig. I—Shape of roof piece for roofing paper birdhouse.

Fig. II—Type of Wren box (front).

Fig. III—Side of box for Downy Woodpecker.

Fig. IV—Another type of Wren box.

(Sketches by John E. Richardson.)

deep. The entrance, which should be the size of a quarter is placed about two inches down from the roof. The latter must be slanting to let the water drain off. After the house is made it should be painted to prevent warping, preferably with gray or brown paint. Several of these houses should be made, as one pair of wrens will raise two or three broods a season and they will use a house only once a year. These Wren boxes may be put up in nearly any fairly open place from six to ten feet above the ground. Each fall after the houses are empty they should all be cleaned out, therefore it is a good plan to have a way to take off one side of the box. It may be hinged or it may slide in grooves.

Another common bird which appropriates bird-houses is the Bluebird. His houses should be the same as for the Wren except for the dimensions. The cavity should be 5 by 5 inches square and 8 inches deep and the entrance should be 1 1/2 inches in diameter. The distance above the ground is the same as for the Wren boxes. Above all do not put the entrance on the floor in any bird-house you build.

Cleats nailed on the inside of the barn shed just below the roof will help the Barn Swallows greatly.

The Downy Woodpecker prefers a house with a cavity 4 by 4 inches square and 8 to 10 inches deep with the diameter of the entrance 1 1/2 inches. The boxes for these little woodpeckers should be placed from 6

to 20 feet above ground. The Flicker, another member of the Woodpecker tribe, uses a box with the cavity 7 by 7 inches square and 16 to 18 inches deep. His entrance should be about 2 1/2 inches. If you build your Flicker boxes 8 by 8 inches square and 16 inches deep with a 3-inch entrance they can be used by either Screech Owls or Flickers. In either case they should be placed from 10 to 30 feet above the ground.

Your Downy Woodpecker boxes will also suit Tufted Titmice, Chickadees and white-breasted Nuthatches if you can induce them to stay over the summer with you.

Another very satisfactory type of bird-box may be made out of heavy roofing paper. The paper should be left in a warm place for a day before it is used to soften it. A round piece of wood is used for the bottom of the house. The box itself is made by a round cylinder of the paper. The roof is a round piece of the roofing material two inches larger in diameter than the bottom of the box. This piece is then cut as in Fig. I. The straight edges are lapped over and fastened with split rivets which are also used in the construction of the cylinder for the body of the box. Perches for all your houses may be made by nailing forked twigs or small blocks of wood just below the entrance.

If you build several bird-houses, put them up and clean them out each fall after they have been used, in a few years you will have a bird colony of surprising size besides getting much enjoyment from studying our birds.—Russell Richardson, Jr.

LETTERS FROM THE BOYS

Dear Editor—I like to read the Boys' Page so well that I thought I would write and help it along.

I live on a farm of 60 acres. My father has ten cows and two horses. I have a cow and milk her every day. I also have some Flemish Giant hares. I don't have far to go to school and am in the sixth grade. I am ten years old and have three sisters and one brother. We have three pigs, one dog, two cats and forty chickens. We have a few maple trees to tap for maple syrup.

This is not a very big letter, but I think it will help to fill up the Boys' Page. I can't think of any more, so I will close.—D. M. Abrams, Bradford Co., Pa.

Dear Editor—I am glad to see a page in Pennsylvania Farmer for the boys. I have read the Boys' Page for several weeks and have decided to write a letter.

I am 15 years old and am in the seventh grade in school. I live on a farm and have two brothers and three sisters. My older brother and I own a calf which we intend to sell in a few days. I have \$17.50 in the bank and I am going to put more in as soon as I can. I am going to raise some rabbits this coming summer; also some hogs as soon as I can get them. We are going to move before long to a farm of about 540 acres which we recently bought.—Robert F. Purnell, Washington Co., Md.

The Voice of the Pack

by Edison Marshall

CHAPTER XII

"I'LL TELL YOU WHY! Because some one else—evidently a cop—was already searchin' it. Both of us know there's nothin' there anyway. We've gone over it too many times. After a while he went away—but I didn't turn back yet. That wouldn't be Jim Gibbs. I shadowed him, just as you'd want me to. And he went straight back to the body."

"Yes?" Cranston had hard work curbing his impatience. Again Gibbs' eyes were full of ominous speculations.

"He stopped at the body, and it was plain he'd been there before. He went crawling thru the thickets, lookin' for clues. He done what you and me never thought to do—lookin' all the way between the trail and the body. He'd already found the brass shell you told me to get. At least, it wasn't there when I looked, after he'd gone. You should've thought of it before. But he found somethin' else a whole lot more important—a roll of papers that Hil-dreth had chucked into an old pine stump when he was dyin'. It was your fault Cranston, for not gettin' them that night. You needn't've been afraid of any one hearin' the shot and catching you red-handed. This detective stood and read 'em on the trail. And you know—just as well as I do—what they were."

"Darn you, I went back the next morning, as soon as I could see. And the mountain lion had already been there. I went back lots of times since. And that shell ain't nothing—but all the time I supposed I put it in my pocket. You know how it is—a fellow throws his empty shell out by habit."

Gibbs' eyes grew more intent. What was this thing? Cranston's tone, instead of commanding, was almost pleading. But the leader caught himself at once.

"I don't see why I need to explain any of that to you. What I want to know is this: why you didn't shoot and get those papers away from him?"

For an instant their eyes baffled. But Gibbs had never the strength of his leader. If he had, it would have been asserted long since. He sucked in his breath, and his gaze fell away. It rested on Cranston's rifle, that in some manner had been pulled up across his knees. And at once he was cowed. He was never so fast with a gun as Cranston.

"Blood on my hands, eh—same as on yours?" he mumbled, looking down. "What do you think I want, a rope around my neck? These hills are big, but the arm of the law has reached up before, and it might again. You might as well know first as last I'm not goin' to do any killin's to cover up your murders."

"That comes of not going myself. You fool—if he gets that evidence down to the courts, you're broken

the same as me."

"But I wouldn't get more'n a year or so, at most—and that's a heap different from the gallows. I did aim at him—"

"But you just lacked the guts to pull the trigger!"

"I did, and I ain't ashamed of it. But besides—the snows are here now, and he won't be able to even get word down to the valleys in six months. If you want him killed so bad, do it yourself."

This was a thought indeed. On the other hand, another murder might not be necessary. Months would pass before the road would be opened, and in the meantime Cranston could have a thousand chances to steal back the accusing letters. Perhaps they would be guarded closely at first, but by the late winter months they would be an old story, and a single raid on the house might turn the trick. He didn't believe for an instant that the man Gibbs had seen a detective. He had kept too close watch over the roads for that.

"A tall chap, in outing clothes—dark-haired and clean-shaven?"

"Yes?"

"Wears a tan hat?"

"That's the man."

"I know him—and I wish you'd taken those papers away from him and slapped his face, and he would not even have put up his arms. And now he'll hide 'em somewhere—afraid to carry 'em for fear he meets me. That's failin'—the tenderfoot that's been staying at Lennox's. He's a lunger."

"He didn't look like no lunger to me."

"But no matter about that—it's just as I thought. And I'll get 'em back—mark my little words."

In the meantime the best thing to do was to move at once to his winter trapping grounds—a certain neglected region on the lower levels of the North Fork. If at any time within the next few weeks, Dan should attempt to carry word down to the settlements, he would be certain to pass within view of this camp.

But he knew that the chance of Dan starting upon any such journey before the snow had melted was not one in a thousand. To be caught in the Divide in the winter means to be snowed in as completely as the Innuits of upper Greenland. No word could pass except by a man on snowshoes. Really there was no urgency about this matter of the evidence.

Yet if the chance did come, if the house should be left unguarded, it might pay Cranston to make an immediate search. Dan would have no reason for supposing that Cranston suspected his possession of the letters; he would not be particularly watchful, and would probably pigeon-hole them until spring in Lennox's desk.

And the truth was that Cranston had reasoned out the situation almost perfectly. When Dan awakened in the morning, and the snow lay a foot deep over the wilderness world, he knew that he would have no

chance to act upon the Cranston case until the snows melted in the spring. So he pushed all thought of it out of his mind and turned his attention to more pleasant subjects. It was true that he read the documents over twice as he lay in bed. Then he tied them into a neat packet and put them away where they would be quickly available. Then he thrust his head out of the window and let the great snowflakes sift down upon his face. It was winter at last, the season that he loved.

He didn't stir from the house, that first day of the storm. Snowbird and he found plenty of pleasant things to do and talk about before the roaring fire that he built in the grate. He was glad of the great pile of wood that lay outside the door. It meant life itself, in this season. Then Snowbird led him to the windows, and they watched the white drifts pile up over the low underbrush.

When finally the snowstorm ceased, five days later, the whole face of the wilderness was changed. The buckbrush was mostly covered, the fences were out of sight; the forest seemed a clear, clean sweep of white, broken only by an occasional tall thicket and by the great, snow-covered trees.

When the clouds blew away, and the air grew clear, the temperature began to fall. Dan had no way of knowing how low it went. Thermometers were not considered essential at the Lennox home. But when his eyelids congealed with the frost, and his mittens froze to the logs of firewood that he carried thru the door, and the pine trees exploded and cracked in the darkness, he was correct in his belief that it was very, very cold.

But he loved the cold, and the silence and austerity that went with it. The wilderness claimed him as never before. The rugged breed that were his ancestors had struggled thru such seasons as this and passed a love of them down thru the years to him.

When the ice made a crust over the snow, he learned to walk on snowshoes. At first there were painful ankles and endless floundering in the drifts. But between the fall of fresh snow and the thraws that softened the crust, he slowly mastered the art. Snowbird—and Dan never realized the full significance of her name until he saw her flying with incredible grace over the snow—laughed at him at first and ran him races that would usually end in his falling head-first into a ten-foot snowbank. She taught him how to ski and more than once she would stop in the middle of an earnest bit of pedagogy to find that he was not listening at all. He would seem to be fairly devouring her with his eyes, delighting in the play of soft pinks and red in her cheeks, and drinking, as a man drinks wine, the amazing change of light and shadow in her eyes.

She seemed to blossom under his gaze. Not one of those short winter days went by without the discovery of some new trait or little vanity to astonish or delight him—sometimes an unlooked-for tenderness toward the weak, often a sweet, untainted philosophy of life, or perhaps just a lowering of her eyelids in which her eyes would show suspicious thru the lashes, or some sweeping, exuberant gesture startlingly graceful.

Lennox awakened one morning with the realization that this was one of the hardest winters of his experience. More snow had fallen in the night and had banked halfway up his win-

dows. The last of the shrubbery—except for the ends of a few tall bushes that would not hold the snow—was covered, and the roofs of some of the lower outbuildings had somewhat the impression of drowning things, striving desperately to keep their heads above water. He began to be very glad of the abundant stores of provisions that overcrowded his pantry—savory hams and bacon, dried venison, sacks of potatoes and evaporated vegetables, and, of course, canned goods past counting. With the high fire roaring in the grate, the season held no ill for them. But sometimes, when the bitter cold came down at twilight, and the moon looked like a thing of ice itself over the snow, he began to wonder how the wild creatures who wintered on the Divide were faring. Of course most of them were gone. Wolf, long since, had grunted and mumbled his way into a winter lair. But the wolves remained, strange gray shadows on the snow, and possibly a few of the harder smaller creatures.

More than once in those long winter nights their talk was chopped off short by the song of the pack on some distant ridge. Sometime, when the world is old, possibly a man will be born that can continue to talk and keep his mind on his words while the wolf pack sings. But he is certainly an unknown quantity today. The cry sets in vibration curious memory chords, and for a moment the listener sees in his mind's eye his ancient home in an ancient world—Darkness and Fear and Eyes shining about the cave. It carries him back, and he knows the wilderness as it really is; and to have such knowledge dries up all inclination to talk, as a sponge dries water. Of course the picture isn't entirely plain. It is more a thing guessed at, a photograph in some dark part of an under-consciousness that has constantly grown more dim as the centuries have passed. Possibly sometime it will fade out altogether; and then a man may continue to discuss the weather while the Song from the ridge shudders in at the windows. But the world will be quite cold by then, and no longer particularly interesting. And possibly even the wolves themselves will be tamed to play dead and speak pieces—which means the wilderness itself will be tamed. For as long as wild lasts, the pack will run thru it in the winter. They were here in the beginning, and in spite of constant war and constant hatred on the part of men, they will be here in the end. The reason is just that they are the symbol of the wilderness itself, and the idea of it continuing to exist without them is stranger than that of a nation without a flag.

It wasn't quite the same song that Dan had listened to in the first days of fall. It had been triumphant then, and proud with the wilderness pride. Of course it had been sad now, then, too, but it was more sad now. And it was stranger, too, and crept farther into the souls of its listeners. It was the song of strength that couldn't avail against the snow, possibly of cold and the despair and courage of starvation. These three that heard it were inured to the wilderness; but a moment was always needed after its last note had died to regain their gaiety.

"They're getting lean and they're getting savage," Lennox said one night, stretched on his divan before the fireplace. He was still unable to walk; but the fractures were knitting slowly and the doctor had promised that the summer would find him

well. "If we had a dog, I wouldn't offer much for his life. One of these days we'll find 'em in a big circle around the house—and then we'll have to open up with the rifles."

But this picture appalled neither of his two young listeners. No wolf pack can stand against three marksmen, armed with rifles and behind oaken walls.

Christmas came and passed, and January brought clear days and an ineffective sun shining on the snow. These were the best days of all. Every afternoon Dan and Snowbird would go out on their skis or on snowshoes, unarmed except for the pistol that Snowbird carried in the deep pocket of her mackinaw. "But why not?" Dan replied to Lennox's objection. "She could kill five wolves with five shots, or pretty near it, and you know well enough that that would hold 'em off till we got home. They'd stop to eat the five. I have had enough time keeping up with her as it is, without carrying a rifle." And Lennox was content. In the first place, the wolf pack has to be desperate indeed before it will even threaten human beings; and knowing the coward that the wolf is in the other three seasons, he couldn't bring himself to believe that this point was reached. In the second, Dan had told the truth when he said that five deaths, or even fewer, would repel the attack of any wolf pack he had ever seen. There was just one troubling thought. He had heard, long ago, and he had forgotten who had told him, that in the most severe winters the wolves gather in particularly large packs; and a quality in the song that they had heard at night seemed to bear it out. The chorus had been exceptionally loud and strong, and he had been unable to pick out individual voices.

The snow was perfect for skiing. Previously their sport had been many times interrupted either by the fall of fresh snow or a thaw that had softened the snow crust; but now every afternoon was too perfect to remain indoors. They shouted and romped in the silences, and they did not dream but that they had the wilderness all to themselves. The fact that one night Lennox's keen eyes had seen what looked like the glow of a camp fire in the distance didn't affect this belief of theirs at all. It was evidently just the phosphorus glowing in a rotten log from which the winds had blown the snow.

Once or twice they caught glimpses of wild life: once a grouse that had buried in the snow flushed from their path and blew the snow-dust from its wings; and once or twice they saw snowshoe rabbits bounding away on their feet over the drifts. But just once they caught sight of a wolf. They were on snowshoes on a particularly brilliant afternoon late in January.

He was a lone male, evidently a stranger from the pack, and he leaped from the top of a tall thicket that had remained above the snow. The man and the girl had entirely different reactions. Dan's first impression was amazement at the animal's condition. It seemed to be in the last stages of starvation: unbearably gaunt, with rib bones showing plainly even thru the furry hide. Ordinarily the heavy furred animals do not show signs of famine; but even an inexperienced eye could not make a mistake in this case. The eyes were red, and they carried Dan back to his first adventure in the Oregon forest—the day he had shot the mad coyote. Snowbird thought of the beast only as an

enemy. The wolves killed her father's stock; they were brigands of the worst order; and she shared the hatred of them that is a common trait of all primitive peoples. Her hand whipped back, seized her pistol, and she fired twice at the fleeing figure. The second shot was a hit: both of them saw the wolf go to its side, then spring up and race on. Shouting, both of them sped after him. In a few moments he was out of sight among the distant trees, but the track led them on clear down the next canyon. And now they cared not at all whether they found him: it was simply a tramp in the out-or-doors; and both of them were young with red blood in their veins.

But all at once Dan stopped in his tracks. The girl sped on for six paces before she missed the sound of his snowshoes; then she turned to find him standing, wholly motionless, with eyes fixed upon her.

It startled her, and she didn't know why. A companion abruptly freezing in his path, his muscles inert, and his eyes filling with speculations is always startling. When this occurs, it means simply that a thought so compelling and engrossing that even the half-unconscious physical functions, such as walking, cannot continue, has come into his mind. And it is part of the old creed of self-preservation to dislike greatly to be left out on any such thought as this. If danger is present, the sooner it is identified the better.

"What is it?" she demanded. He turned to her, curiously intent. "How many shells have you in that pistol?"

She took one breath and answered him. "It holds five, and I shot twice. I haven't any others."

"And I don't suppose it ever occurred to you to carry extra ones in your pocket?"

"Father is always telling me to—and several times I have. But I'd shoot them away at target practice and forget to take any more. There was never any danger—except that night with a cougar. I did intend to—but what does it matter now?"

"We're a couple of wise ones, going after that wolf with only three shots to our name. Of course by himself he's harmless—but he's likely enough to lead us straight toward the pack. And Snowbird—I didn't like his looks. He's too gaunt, and he's too hungry—and I haven't a bit of doubt he waited in that brush for us to come, intending to attack us—and lost his nerve the last thing. That shows he's desperate. I don't like him, and I wouldn't like his pack. And a whole pack might not lose its nerve."

"Then you think we'd better turn back?"

"Yes, I do, and not come out any more without a whole pocket of shells. I'm going to carry my rifle, too, just as Lennox has always advised. He's only got a flesh-wound. You saw what you did with two cartridges—got in one flesh-wound. Three of 'em against a pack wouldn't be a great deal of aid. I don't mean to say you can't shoot, but a jumping, lively wolf is worse than a bird in the air. We've gone over three miles; and he'd lead us ten miles farther—even if he didn't go to the pack. Let's go back."

"If you say so. But I don't think there's the least bit of danger. We can always climb a tree."

"And have 'em make a beautiful circle under it! They've got more pa-

A Story for Children

Marjorie's Playmate

MARJORIE JAMES was a little girl who lived in a great big city. The James home was one of a row, that is, houses were built right on to their own house on both sides. This little girl had no big yards and fields to play in such as boys and girls who live in the country have. On that account, Marjorie could have no pets and she wanted something for a playmate, very badly.

One day some people moved next door, who had some little baby chickens. One of the little peeps, escaped and squeezed thru the fence. Marjorie was playing and when she saw it, she squealed with joy and picked

Marjorie and Speckle

it up very gently. She played with the little chicken so happily that she did not see a man standing at the fence watching her.

"Would you like to have that little chick for your own?" he asked.

Marjorie jumped, "Oh, may I?" she breathed.

"Yes, if your mother will let you have it."

Marjorie's mother could not refuse when she saw how happy her little girl was. So they kept the chicken and every morning, noon and night it was fed, petted and cared for. It

ience than we have—and we'd have to come down sometime. Your father can't come to our help, you know. It's the sign of the tenderfoot not to think there's any danger—and I'm not going to think that way any more."

They turned back and munched in silence a long time.

"I suppose you'll think I'm a coward," Dan asked her humbly.

"Only prudent, Dan," she answered, smiling. Whether she meant it, he did not know. "I'm just beginning to understand that you—living here only a few months—really know and understand all this better than I do." She stretched her arms wide to the wilderness. "I guess it's your instincts."

"And I do understand," he told her earnestly. "I sensed danger back there just as sure as I can see your face. That pack—and it's a big one—is close; and it's terribly hungry. And you know—you can't help but know—that the wolves are not to be trusted in famine times."

"I know it only too well," she said. Then she paused and asked him about a strange grayness, like snow blown by the wind, on the sky over the ridge.

(Continued Next Week.)

Visitor: I hardly know what to do with my week-end.

Native: I suggest that you put a hat on it.

became very tame and seemed to understand how to play. When Marjorie chased it, it would run and flap its wings, enjoying the game as much as its playmate.

All went well until the chicken, now called Speckle, grew bigger. Then it began to take privileges and go into the house. Once inside Speckle ate anything she wanted or roosted any place that looked comfortable. Mrs. James grew tired of this and one day, after Speckle had jumped upon some clean clothes with her dirty feet, she threatened to kill her for dinner. Marjorie cried and Speckle's life was spared that time.

The minister came to dinner one evening and just as he finished asking the blessing, there was a flap of wings and Speckle landed on the table right in front of Mrs. James.

"Oh! oh!" was all Mrs. James could say, but she looked at her small daughter, who was laughing into her napkin, and whispered:

"This is Speckles last night. We simply can't have this happen again."

That night, after every one was asleep, Marjorie tip-toed downstairs and brought Speckle into the house.

"Dear old Speckle," she said, with tears choking her. "This is your last night and I'm going to let you sleep in the house. Good night, Speckle."

In the middle of the night, everyone was awakened by a loud cackling and a chair falling over. Mr. James ran down stairs just in time to see a man running thru the door. The safe was partly opened but nothing was gone.

"Well, well, Speckle, you're a pretty good scout after all," he said, smoothing Speckles ruffled feathers. I guess we'll keep you a while longer, as we seem to need you."—L. M. K.

WORK

Let me do my work from day to day, In field or forest, at the desk or loom. In roaring market place or tranquil room

Let me but find it in my heart to say When vagrant wishes beckon me astray,

"This is my work, my blessing, not my doom;

Of all who live I am the one by whom This work can best be done in the right way."

Then shall I see it not too great nor small

To suit my spirit and so prove my powers;

Then shall I cheerfully greet the laboring hours

And cheerfully turn when the long shadows fall

At eventide to play and love and rest, Because I know for me my work is best

Henry Van Dyke.

Understan'?

"Now boys," said the schoolmaster to the geography class. "I want you to bear in mind that the affix 'stan' means 'the place of.' Thus we have Afghanistan, the place of Afghans—also Hindustan, the place of Hindus. Can anyone give another example?"

Nobody appeared very anxious to do so until little Johnny Snaggs, the joy of his mother and the terror of cats, said proudly, "Yes, sir, I can. Umbrellastan, the place for Umbrellas."

Same Stock-but Better Results

There are two ways to get more from your live stock. One is to increase the NUMBER of animals. The other—the better way—is to make each animal **YOU NOW OWN** do better. The latter is the safer, the more profitable method. It is "intensive cultivation" applied to live stock.

Pratts Animal Regulator

is compounded for one purpose—to make poor stock good—to make good stock better. And for nearly fifty years "Pratts," America's original stock tonic and conditioner, has been doing this work—doing it WELL.

Pratts Animal Regulator is a real builder and preserver of health and strength. It helps to put live stock in such perfect physical condition that best results are SURE to follow.

FOR—Greater strength and endurance from your work animals—
Increased flow of milk from your cows—
Healthy, vigorous young from your breeding stock—
Rapid and healthy growth from your young stock—

USE PRATTS ANIMAL REGULATOR
Our Money-Back Guarantee protects you

Pratts Dip and Disinfectant

is a big help, too. By killing disease germs and skin parasites, and by keeping stables and pens in sanitary condition, it protects the health and promotes the comfort of live stock. That means but one thing—better results—bigger profits.

"Your Money Back If YOU Are Not Satisfied"

See the Pratt dealer near you—
once. Initiate upon getting "Pratts."

Care of Brood Sows

By W. H. TOMHAVE

MOST of the brood sows upon the farms are bred to farrow during these months may be three fold. In the first place, the farmer as a rule has more time to look after the brood sows before the rush of spring work comes on. The second reason is that the pigs can be developed and ready for an early fall market before it gets too cold and before the bulk of the hogs from the corn belt are sent to market and usually cause a depression in the price. The third reason is that the pigs are large enough to go on forage crops when they are ready and are well enough developed to make good use of the forage crops that are planted.

The success of the swine growing business depends in a large measure upon the number of pigs that are farrowed and the number raised. The general condition and strength of the litter at farrowing time is a factor in saving a large percentage of the pigs farrowed.

We have previously discussed the feeding of the brood sow during the

ance a little more bulky by adding a little bran. The day before she is to farrow the grain can be kept from her entirely with the possible exception of a handful or two of feed in water. The same treatment should be given her the day after farrowing. Give her all the lukewarm water that she will drink. The second day after farrowing allow her a light feed of shorts and gradually increase it daily so that she is back on her full allowance of feed at the end of a week.

The pen in which the sow is placed for farrowing should be clean and dry. It should be equipped with guard rails about 6 to 8 inches from the floor so that the sow will not lie on the small pigs by crowding them against the wall. The pen should be well bedded but do not use too much straw. If too much straw is used the small pigs may get covered with straw and the brood sow will step on them without noticing that they are under her feet. Sometimes small pigs are lost because the owner wants to be kind to them by giving

Acme Wagons

are equipped with National Tubular Self Oiling Axle.

A reputation of almost 50 years of wagon building stands back of each ACME. Ask your dealer to show you one or write us for booklet.

Acme Wagon Co., EMIGSVILLE, PENNA.

The Economical Way to Handle Manure

gestation period. It may be well, however, to again suggest the use of a ration that is rich in protein and also that the sows have an abundance of exercise. Daily exercise has a tendency to stimulate the appetite of the sow and it also helps to keep her in a healthy and thrifty condition. A good live stock man always keeps a record of the date of breeding of all on the farm as it is sometimes difficult to tell exactly when a sow is going to farrow unless there is a record of the breeding date. The gestation period of a brood sow is about 112 days.

About a week before the sow is to farrow remove her from the balance of the herd and place her in a separate lot or farrowing pen. Such treatment will get her accustomed to her new environment and she will not be so restless as when she is taken from the balance of the herd about a day before farrowing.

The brood sow that is about to farrow should not have an abundance of grain. If the sow has been getting a liberal supply of food a good rule to follow is to cut her grain ration in half about four or five days before farrowing and make her feed allow-

them an extra amount of straw. If the weather is cold at farrowing time it is often a wise practice to remove the pigs from the sow when they are first born and place them in a basket or barrel with some heated brick or stone and straw in the bottom to keep them warm. This same practice may be followed if the brood sow is nervous and restless. When this is practiced they should be put back with the sow every three hours for suckling. If the weather is mild and the sow is quiet it is usually best to leave the pigs with the sow and she will take care of them in good shape.

BERKSHIRE CONGRESS MEETS

The annual American Berkshire Congress and sale was held in the First Regiment Armory, Philadelphia, Feb. 16 to 18. Two days of the meeting were devoted to the discussion and demonstration of Berkshire problems and the sale of 55 purebred Berkshires was held Friday afternoon.

The business session and the report of committees took place at the Hotel Lorraine, Wednesday afternoon.

FREE Trial Pkge

CORONA WOOL FAT

I want every reader of this paper to know from experience what a splendid, dependable preparation Corona Wool Fat is, for the household or barn use. I want to send every one a FREE Trial Package. I don't ask for a cent of money—now or later—not even for postage. I just want you to have this Trial Package on hand when something happens, so that you can test it and see for yourself what a remarkable healing and soothing salve it is for caked udders, sore teats, barb wire cuts, rope burns, wounds, sores of any kind, hoof troubles, boils, scratches, sore shoulders, etc., on live stock.

I want you to also see how quickly it heals cuts, sores, burns, chapped hands and wounds of any kind on human beings, for I know if you once try it, you'll never be without Corona in the house and barn.

The Healing Ointment—for the Home and Barn
Hardly a day goes by in which you will not find some use for Corona. It is a household word in over a million homes. After you use this trial package you too will say, "That's great stuff." Corona Wool Fat is not a grease, but the fatty secretions extracted from the wool and skin of sheep. It's different from any salve or ointment you ever tried. It heals and soothes, but will not smart or blister the most sensitive wound. It has healed thousands of wounds without leaving a scar where other healing lotions have failed.

Fill out and mail coupon today. Get my FREE Trial Package, test it and see for yourself that Corona Wool Fat is the greatest healing ointment. I know that after a trial you will never want to be without Corona again. A can in the house or barn is a sure and safe first aid for any injury of man or beast. Corona Wool Fat is sold by leading Drug Stores, Hardware Dealers, and Blacksmiths. C. G. Phillips, Pres.

Grow Hogs and Poultry on Semi-Solid Buttermilk

Quick, Economical Growth Means Less Feed, Less Time, More Money. Experienced feeders know the value of pure, rich buttermilk. Semi-Solid Buttermilk is a fresh creamery buttermilk with water taken out. Averages 500 lbs. to a barrel and makes 1000 gallons of rich butter. Ideal for mixing with grain, mash and other feed. Also acts as a wonderful tonic and conditioner. Keeps stock healthy and full of milk. Write for FREE BROCHURE and further information on Semi-Solid Buttermilk and facts about feeding for profit.

COUNTY NOTES

Union Co., Pa.—Again the wheat fields are covered with snow which is needed protection. Wheat is being marketed slowly at \$1.60 to \$1.75 per bushel to local mills, as the biggest mill in the county, Buffalo Flour Mills, is not running or buying any wheat at present.

Small lots of corn have been sold at 70c to supply teams at the mines, but the bulk of the crop is in farmers' hands yet. With grain, stock and milk at lower levels, farmers have been slow about ordering fertilizers until prices dropped as they have some lately, and likely not as much will be used as last year.

Bologna cows shipped from the county lately sold for the price of 14 years ago, dealers say. Steer feeders are urged to hold their cattle until May or June with the idea of getting cost for feed. Several carloads of Western horses have been sold lately at \$350 to \$760 for mated teams to farmers, as very few farmers here raise their own horses.

Public sales of live stock have begun, and will continue daily until April second. At one sale good grade cows, 6 in number, averaged \$107, but were bought mostly by relatives of the man having the sale. Farmers' institutes of one day each were held at three places last week and were fairly well attended for this county. Hope the so-called "daylight saving bill" gets the defeat it deserves, as it should be the "daylight wasting law" for such it is to most people.—J. N. Glover.

Wyoming Co., Pa.—At this writing the weather has been unusually fine. In some places it was difficult to get ice off the river but was plentiful and of good quality on ponds. Farmers are cutting wood, hauling manure and getting ready for spring work. Farm help seems to be more plentiful than for several years, and at somewhat reduced wages. But still too high according to prices received by farmers. Milk is \$2.10 per 100 in the 200-mile zone; eggs, 30c doz.; butter, 45c lb.; chickens, 30¢ @ 32¢ lb.; dressed beef, 10c lb.; dressed pork, 12¢ @ 13c.

Feed prices are substantially lower, which helps the dairymen. Corn meal, \$2.00; oats, \$2.15; gluten, \$2.40; cottonseed, \$2.60; oil meal, \$2.65; bran, \$2.10. This is almost exclusively a dairy section and the recent slump in prices of livestock and milk is opening the dairymen's eyes to the necessity of keeping only high producers. Many are changing from grades to purebreds and are testing cows on the accredited herd plan. So perhaps the dark cloud is not without a silver lining. Sometimes it takes a hard fall to get us out of the rut.—P. A. Valentine.

Blair Co., Pa.—We are having some real winter here now. We have sixteen inches of snow and the thermometer registered as low as 8 below zero, while ten days ago it was up to 62 degrees above. There is quite a lot of colds and tonsillitis. The roads in some places are in a deplorable condition. The farmers around here are all against the daylight saving plan. If the city people want to go to work an hour earlier let them do so, no use to change the time.

The markets are as follows: Apples, \$1 bu.; potatoes, \$1.25; corn, \$1; wheat, \$1.80; oats, 75c; chickens, 30c lb.; eggs, 45c dozen. There are not many sales this spring, lots of people moving from town to the country.—H. M. McVey.

Western Electric Power & Light

Makes The Battery Last Longer

Running the milking machine—one of the many pieces of farm machinery you can operate from the pulley on the Western Electric Outfit.

Why you should buy Western Electric Power & Light

1. It is an extra powerful outfit.
2. It has a pulley that enables you to use your outfit as a powerful engine, either separately or at the same time you charge the battery.
3. All parts are easy to get at.
4. The engine runs on kerosene.
5. The "tapering charge" makes the battery last longer.

Studying the Potato Markets

By DANIEL DEAN

INCREASED production of potatoes as well as every other farm product has been what every farmer, every experiment station, every agricultural college and every department of agriculture has been working for for the last fifty years. The scientific agencies have worked to increase production because they were supported by taxes for that purpose. Every farmer had to keep up-to-date to increase his production, for if he did not, others would do so, and he would be ruined by the competition of those who adopted the most up-to-date methods, crops and tools. It was the old case of "The Devil take the hindmost."

Today, marketing has taken the place of increased production as the topic which most interests farmers, whether at an agricultural meeting, or when two neighbors talk across the fence. I have talked to the potato growers of four states this winter at their Farmer's Weeks in Pennsylvania, Michigan, Ohio and at Cornell, New York. At every one of these meetings I find that the one vital interest was well expressed by a veteran farmer when he said: "We all know how to produce a crop too big to sell. What we want to know now is how to sell what we have left of last year's crop for enough to stay in business next summer."

The problem of the farmer's marketing his crop has been attacked from every angle. A few years ago direct sale to the consumer was advocated. Just now, much emphasis is being placed on farmers' co-operative organizations for marketing potatoes, as in Virginia, Michigan and Minnesota. It is often forgotten that the percentage of the whole American crop so marketed is yet very small. The rest of us either sell direct to the consumer for thru a longer or shorter chain of dealers.

Need of Accurate Information

No matter what method the potato grower uses to sell his crop, the difference between profit and loss for his year's work, and often that of having any wages at all for his year's labor, will depend on his ability to know how, when and where to sell his crop. It costs just as much to produce a crop that is then marketed wisely as for one that is thrown on the market without any real effort to find what it should and would bring. Few farmers yet know how many different aids to marketing the grower has, and how to find and use them. These aids require but little time to study, but their use pays far larger dividends in cash than does the same amount of work expended in producing the crop.

Daily Market Report

Every day the branches of the National Bureau of Markets all over the United States pub-

lishes a bulletin giving potato markets. For example, that from my nearest station, Rochester, N. Y., gives the previous day's markets in the great consuming centers of the East and Middle West. Not only is the sale price of every important variety given, but also the receipts in number of car loads, stock on hand and the tendency of the market, weak, strong or otherwise. Next is given the markets at the principal shipping centers. Each tells whether farmers are hauling or not, the prices paid to farmers, the prices at which dealers are shipping and the market tendencies. Finally, these reports give the daily report of the number of car lots shipped. With a small amount of experience in studying these daily market reports it is easy to forecast price changes in any center.

Few potato growers are as well acquainted with the daily market report as they are with the monthly reports of the Bureau of Crop Estimates, which get so much greater newspaper publicity. Every month from July to December the Bureau of Crop Estimates gets out a most careful report estimating how many bushels of potatoes have been already produced, and how many will be produced for the whole season, finishing with the December estimate after the crop is all dug. This report is the foundation upon which the northern potato grower must sell his crop. It tells him just how many potatoes his competitors have in other states, and how production compares with other years.

The 400,000,000 Bushel Crop

Potato growers, dealers and consumers have thought of but little all the fall and winter so far excepting the expression "400 million bushel crop." It sounds big. But every one has at the same time forgotten another big figure reported by the Census Bureau, that of 105,683,108 consumers we have in the United States today to eat the crop. When we work out just how many bushels per consumer there were produced, we find that there have been a number of much larger crops, and that the per capita of 4.07 bushels is only ten pounds apiece more than we have been using up in the average of the three war years just past, and about fifteen pounds each more than the average before the war, 3.78 bushels.

All thru the fall and winter every one has been thinking that there must be enormous quantities of potatoes somewhere, sure to smash the price as soon as they began to move. Every grower was anxious to get his sold first, and the result has been that markets have been steadily forced down for months by the constant pressure of more potatoes than the market could quickly

use each day. Each day the Bureau of Markets reports that the car lot movement of potatoes breaks all records, and still the growers keep on selling, not only by car lots, but, now that freights are higher, by truck to an amount never dreamed of before.

What We Now Have Left

On every January first the Bureau of Crop Estimates gets out another report different from the kind we have been discussing. Its reporters all over the United States report how many potatoes were left on hand January first from the preceding year's crop, how many held by growers, and how many by dealers. This report does not get into city newspapers to any extent. It is what the northern potato grower needs far more than he needs the summer estimates of how many will be produced later. He needs it because it tells him in the plainest way how fast the potato crop is being eaten, and by that, whether to sell faster to get rid of a surplus, or to sell slower when the remaining stock is short. Out of the whole crop grown in 1920, 430,458,000 bushels, there was left on hand January first only 145,286,000 bushels. This shows that the nation has eaten more potatoes this year than ever before.

Consumption to Date

The movement of potatoes to date is the heaviest ever known, but what is equally important, it is more than ever a movement into consumption and not into storage. Eastern potato growers are very thoroly familiar with the fact that dealers of all kinds are storing less potatoes than usual this season, and this is further proved by the January first report which shows that dealers are only holding 14.7 per cent of the present crop against 23.1 per cent a year ago. All thru the East and the Middle West hundreds of thousands if not millions of families living in villages, small cities and the suburbs of large cities have in other years bought in the fall ten to twenty-five bushels apiece and stored for use in winter and spring. This year they have very largely not done so. Each family has bought a few at a time, only when needed at once. This fact has a most important bearing on the quantity of potatoes left and their price. It means that these many city families must keep right on buying the rest of the year instead of having a stock in the cellar enough to carry them thru. It means that the record-breaking car lot shipments went into consumption instead of into storage.

Rot in Storage

The other big factor in cutting down the stock left on hand January first was rot in storage. (Continued on Page 15).

This Farm Belongs to Ezra S. Kline, Lancaster County, Pa. It has been in the hands of the Kline Family for almost one hundred years, having first come into the possession of William Kline; subsequently belonging to Hirom Kline. It has been in the hands of the present owner for 36 years. The farm consists of seventy-two acres of rich gravel soil.

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

LIMESTONE AND ITS AGRICULTURAL USES

The last available figures for stone quarried in the United States are those for 1918. In that year the total output of limestone was 53,868,200 short tons, valued at approximately \$49,500,000. This represents about 79 per cent of the total quantity of stone and 60 per cent of the total value of the stone quarried in the United States. The quantity just given does not include some of the limestone used in the manufacture of Portland cement. With this included, the total consumption of limestone in 1918 was about 78,000,000 tons. In the preceding year the corresponding consumption was about 95,000,000 tons. Evidently, therefore, a considerable reduction took place between 1917 and 1918 in the output of limestone.

It is interesting to note that only a small portion of the total output of limestone is used for agricultural purposes. It appears that the largest quantity is used in the refining of metals; that is, it is used as a flux to the extent of nearly 27,000,000 tons a year. Nearly 20,000,000 tons were used in 1920 as crushed stone. Between 3,000,000 and 4,000,000 tons were used as building stone. As already noted, large quantities were used in the manufacture of Portland cement. Other uses included rubble, alkali works, sugar factories, glass works, paper mills, etc. The amount used in agriculture was only a little more than one million tons. It will be noted, therefore, that, in spite of the great importance of maintaining a proper supply of limestone in the soil, only a relatively slight proportion of the limestone produced in the United States is used for agricultural purposes. It is no less interesting to see how the use of limestone in agriculture is followed in the different states. The figures for 1918 show that Illinois was the largest user of limestone with nearly 210,000 tons. Pennsylvania with 131,000 tons and Michigan with 100,000 tons are next in order. However, much of the lime produced for agricultural purposes in Pennsylvania and Michigan is distributed in other states, notably New York and New Jersey. The production of limestone for agricultural purposes in New Jersey was somewhat less than 58,000 tons, and in New York somewhat more than 58,000 tons. Ohio, Tennessee and Indiana also produced large quantities for agricultural uses.

Much stimulus to the use of lime for soil improvement has been given both in Illinois and in Tennessee thru the efforts of the State Legislature to create a cheap source of supply. At one time farmers in Illinois could buy ground limestone at the state penitentiary at about 60c a ton. In Tennessee prison labor was similarly used to produce ground limestone for farmers at about 75c per ton. While the prices are now somewhat higher, they are, nevertheless, low enough to encourage the extensive purchase and use of lime for soil improvement. Another factor which tends to encourage the use of lime by farmers is the low freight rates which formerly prevailed in Illinois on agricultural lime. Conditions are at present less favorable for increasing the consumption of lime where it is most needed. In fact, the time has come for a propaganda on a national scale in behalf of the more consistent and systematic use of lime on the farm lands of the Atlantic Coast states and in the Middle West. Concerted action is needed for creating a sentiment toward a national policy dealing with the

lime problem. The following points are worthy of consideration:

1. A careful survey of the lime resources of the United States.
2. A careful survey of the lime requirements of the soils in the different regions of the United States.
3. The encouraging of the use of lime thru establishing practically nominal freight rates on agricultural lime.
4. The providing of storage facilities at freight stations whereby large quantities of agricultural lime may be accumulated to be taken away by farmers when it may seem most convenient to them. Farmers who have occasion to bring produce to town would then be given an opportunity to return with a load of agricultural lime.
5. Wherever practicable, limestone crushers should be installed and used by groups of farmers.
6. Encouragement should be given to the using of by-products containing lime, such as residues from acetylene gas plants, tanneries, soap works, crushed limestone for road purposes, the extraction of zinc and magnesia from their ores, etc.
7. Extensive deposits of lime marl and lime sand are available in many places. Plans should be devised for utilizing these to the benefit of agricultural production.

It is unfortunate that at present the manufacturers of lime products regard the agricultural uses of lime as incidental to more important uses. Many of the lime manufacturers are making lime

worms from lawns would be the use of sodium cyanide. One ounce of this material should be dissolved in eight gallons of water and applied to 25 square feet of surface. If 100 square feet of surface are to be treated, it would be necessary to use four ounces of sodium cyanide in 32 gallons of water. Still larger areas would require proportionately larger amounts. This treatment will destroy angle worms and white grubs, but will not injure the grass. It is to be remembered that sodium cyanide is very poisonous and should be handled with care.—J. G. L.

VALUE OF GREEN MANURE

Can you state approximately how much or how many pounds of nitrogen, phosphate and potash is turned under for every ton of some green manure crop such as alfalfa, clover, cow peas, soy beans, winter vetch, etc. I feel if the above were known it would save fertilizers. For instance, a man turns under a field of winter vetch or some other green manure crop for corn, wheat, potatoes, or a varied field of truck, he would not have to buy a fertilizer containing as much nitrogen. If a man knows how many pounds of the three elements the different crops require to produce a maximum yield he could turn under a certain green manure crop and apply enough commercial fertilizer to make up the deficiency in the three elements and also to overcome leaching.—Subscriber, New Jersey.

Subscriber—The crops to which you refer contain the amounts of plant-food per ton of green material given in the following table. The superiority of the legumes in adding nitrogen to the soil will be readily seen.

	Phos.		Pot-
	Nitrogen	Lbs.	Lbs.
Alfalfa	11.6	2.4	10.0
Red clover	10.8	2.4	13.3
Cowpeas	9.4	2.6	9.2
Soybeans	12.6	2.8	11.2
Winter vetch	7.2	2.0	9.0
Canada field peas	8.8	2.8	8.4
Crimson clover	9.4	2.4	7.8
Sweet clover	8.6	2.4	8.0
Velvet beans	11.0	2.8	11.4
Rape	7.0	2.4	12.4
Rye	6.4	3.4	12.0
Wheat	7.6	3.2	12.0

You will note that for the legumes a ton of green material will add to the soil approximately 10 pounds of nitrogen, 2 1/2 pounds of phosphoric acid and 10 pounds of potash.

In the case of non-legumes the analyses represent material plowed under early in the spring before much growth had been made. Naturally, young plants will contain a relatively higher proportion of nitrogen, phosphoric acid and

potash than is found in older plants. It should also be remembered that some of these crops have exceptionally well-developed root systems. This is particularly true of crimson clover and red clover. When the plants are young the material above ground may weigh less than the portion of the plant underground. Considering roots and tops together, these green crops when plowed under may add to the soil an equivalent of as much as eight tons of green matter. Ordinarily, the amount added under average conditions would be about four or five tons per acre. This would represent an addition to the soil of about 40 pounds of nitrogen and potash and 10 pounds of phosphoric acid. Under favorable conditions, leguminous green crops may add to the soil as much as 150 or even 200 lbs. of nitrogen per acre. Experiments carried on in New Jersey and Delaware show that crimson clover, when plowed under in April, frequently adds about 100 pounds of nitrogen per acre. Where green manure crops of this type are grown the need for purchased nitrogen in commercial fertilizer is reduced, particularly in view of the fact that nitrogen in green clover, cowpeas, soybeans, etc., becomes available rather quickly. Comparative tests made at the New Jersey Experiment Station thru a series of years show that the nitrogen in green clover or in other legume crops is as readily available as nitrate in tankage and fish.—J. G. L.

GETTING RID OF ANGLE WORMS

Can you give me some remedy to rid my lawn of angle worms (commonly called fishing worms) in the spring they kill the grass, no grass growing until about harvest. Any information you can give will be much appreciated.—F. C. C., Pennsylvania.

F. C. C., Pennsylvania—The best treatment thus far proposed for the elimination of angle

It is always easier to discuss the duties of others than to do our own.

Farm Loan Act Upheld

THE SUPREME COURT has settled the question of the constitutionality of the farm loan act and the provision which makes the bonds of the Farm Loan Banks tax-free by handing down a decision to that effect. The suit was brought by certain interests desiring to cripple or put out of business the Farm Loan Banks and was based upon the technicality of the tax-free provision. The Farm Loan Banks may now resume operations and consider the thousands of applications which have been accumulating but held in abeyance pending the decision of the Supreme Court.

The opposition to the F. L. Banks has mostly come from other banking and farm mortgage interests because of the lower rate of interest at which loans are made by Farm Loan Banks. It is altogether possible that an attempt will be made to have Congress amend the law so that the desirable features from the farmer's standpoint will be eliminated. Many city papers, laboring under a misapprehension of agricultural conditions, or from a desire to favor city interests have helped to create more or less popular opposition to the Farm Loan Act by making it appear that it is favoritism or class legislation. Farmers should keep a watchful eye upon the actions of Congress in relation to this matter and bring united pressure, if needful, to prevent the weakening of this popular and much needed loan system. The banking needs of farmers differ from those of every other class because the turn-over of capital is much slower and it is impossible to pay popular interest rates from one profit in one to three years, especially when the profit is so small on the average as it is in farming. When the consuming public comes to realize that favorable financial conditions for the maintenance and development of agriculture inure to the benefit of consumers as well as to farmers this foolish and harmful opposition to many of the farmers' measures will cease.

Farm Bureau Opposition

THE OPPOSITION of certain business interests to the development of the farm bureaus of the nation is becoming so pronounced as to merit the attention of all farmers interested in this movement. A perusal of our Washington Letter this week will show what is being attempted in Congress. The March 1 issue of "Industry," a publication devoted to spreading propaganda of certain kinds, mostly in the interest of "Big Business," altho this is not its professed object, contains a special feature intended to inspire fear

Pennsylvania Farmer

March 19, 1921.

concerning the work of the farm bureaus. The following is quoted from an editorial in the paper named and precedes the leader on the subject:

"The American Farm Bureau Federation, it will be seen, has some potentialities for good and undoubtedly some for evil. It has grown like a noxious weed which may in time choke the legitimate garden of agriculture. It was conceived under un-American policies, and has had the most amazing and rapid growth known in history. It is, moreover, or may become, a two-edged sword of which one edge will injure the general public and the other its creators and followers.

"The American Farm Bureau Federation was built up, primarily at least, on the money of the taxpayers of the country, yet it may become an autocracy entirely foreign to the Constitution of the United States. It actually has reached that point in its development where its remarkable growth, its undoubted influence, and its equally undoubted power may enable it to secure a strangle-hold on the bread and butter and the other necessities of our national life.

"The Federation was born less than one year ago. Today it claims a membership exceeding 1,500,000 farmers. The total annual income of the Federation and its locals is said to be more than \$15,000,000. It is represented in practically every State in the Union. Farmers everywhere, for reasons already set forth, are eagerly enrolling in its ranks. And within the past month this new force in American economics has launched a movement which may well prove of direct menace to the whole people.

"The menace in the situation is obvious. The country may view with tolerance the doubtful genesis of the American Farm Bureau Federation. It may show only a passive interest in this class grouping of a large part of the population. It may not, in view of the unfair burden resting upon the farmer, object to the Federation's growing political power, but if the Federation's Committee of Seventeen and its national sales agency attempt to carry out any plan to control thru a so-called holding company the grain of the nation, the issue must be met in behalf of ALL the people and not a class."

Farmers Victorious

BY A VOTE of 142 to 56 the House defeated the Edmonds Daylight Saving bill this week. This is another evidence of what can be done when public sentiment is crystallized and given expression. We doubt if ever there was a question upon which people were so united in opposition as was the case with the daylight-saving bill. This was very apparent at the hearing held last week in Harrisburg and in the thousands of protests and personal appeals sent to legislators. The overwhelming defeat of the measure was a surprise to city people because city papers did not know public sentiment, or if they did they purposely misinterpreted it by claiming that everybody except a few old-fashioned farmers favored the measure. Ridicule and misrepresentation will win out sometimes but it did not in this instance. Altho all the proponents of the bill argued against a local option bill allowing cities and communities to adopt daylight-saving if they so desire, it is altogether likely that the bill to this effect now in the House will be brought up for passage. Those who favor this bill will find no opposition from farmers. City people may set their own time for getting up, going to work and going to bed but country people will always object to making their long summer days longer.

Our Washington Letter

Simplicity and a lack of official pomp, military demonstration and extravagant ceremonies characterized the inauguration of President Harding, on March 4. An innovation in inauguration ceremonies was the use of the amplifier, a device by which the President's voice during the delivery of his inaugural address was amplified so that every person in the vast crowd assembled could hear distinctly every word of the address. It was a sympathetic crowd that greeted the incoming President. Every man and woman in it, it is safe to say, voiced the prevailing sentiment thruout the nation, that the new administration may be a successful one; that it may guide the nation thru these critical times to the higher ground of general prosperity.

Regarding President Harding's address Dr. T. C. Atkeson, Washington representative of the National Grange, says: "There was little in it that any one can object to. I do not believe that any man has gone to the President's chair that has had a closer view of the agricultural situation or a better understanding of the actual needs of the country people than President Harding. I believe he means to do everything that can be done for the best interests of the people and the nation."

Henry C. Wallace, of Iowa, the new Secretary

of Agriculture, is on trial, but it is Dr. Atkeson's opinion that there is little to risk in his appointment so far as making good. Mr. Wallace is farmer-minded, a graduate of an agricultural college, and has the right viewpoint. "Considering his judicial temperament, his thorough knowledge of agricultural problems and his special training in agricultural economics, I see no reason," says Dr. Atkeson, "why he will not make an ideal Secretary of Agriculture. I expect him to do so."

It is expected that the Sixty-seventh Congress will be called in extra session on or before April 4, when the immigration bill, packer control bill, emergency tariff bill, truth in fabric and other bills will be introduced. Congressman Burton L. French of Idaho, will introduce his honest fabric bill at the beginning of the coming session and will make active effort to secure its enactment.

A resolution aimed to put a curb on the American Farm Bureau Federation's grain marketing program was introduced in the last session of Congress on March 3, by Congressman Norman J. Gould, of New York. The resolution resolves that, whereas, the production and distribution of the nation's food supply is a matter of primary importance to every citizen of the United States; that any combination, contract or agreement to restrict the production of foodstuffs or to unduly enhance their price by combination, collusion, or other unlawful act would work a cruel hardship upon our people, and whereas declines in agricultural products have excited the fear and anxiety of our farming population and may cause them to be misled into the hasty adoption of plans or the formation of associations purported to provide a means of protection against loss, but actually discouraging production and arbitrarily establishing and sustaining the price thru means ultimately injurious to both producer and consumer, be it resolved that the committee on Agriculture of the House be instructed to make inquiry into the nature of actual and proposed agricultural organizations which are in whole or in part receiving appropriations, directly or indirectly, from the treasury of the United States, and whether or not such organizations, or their officers or agents, have proposed or are undertaking to establish, maintain, or control the price of food products thru associations, combinations, contracts, agreements, or otherwise. It is further resolved, that the committee on agriculture shall report its findings to the House, together with such recommendations as may be necessary to protect the public interest and provide unhampered food production, and further to recommend such congressional action or executive action as may remedy any existing condition if such be found requiring legislation, or the prosecution of any individual, organization, or corporation appearing to be engaged in the establishment or operation of unlawful combinations or conspiracies to restrict the production of foodstuffs or artificially enhance the price of the same.

In explanation of his resolution Congressman Gould has issued a statement in which he says: "Certain facts tending to show that an effort is being made by certain farm organizations to restrict the production of foodstuffs which were developed before the recent hearings of the Banking and Currency Committee of the House lead me to investigate the situation more fully. I find in a magazine published in this city a very comprehensive article concerning the activities of the American Farm Bureau Federation in this particular direction. Nothing could be more dangerous to the country than the arbitrary restriction by any organization of farmers of food production for the purpose of increasing prices. It is not merely economically unsound, but it is absolutely dangerous to the health, well being and prosperity of the country.

"There appears to be no doubt that the American Farm Bureau Federation is committed to such a policy. It appears that what is known as the Farmers' Grain Marketing Committee of Seventeen of the American Farm Bureau Federation, in session in Kansas City in February, recommended the adoption of a grain marketing plan and this committee of Seventeen actually intends that the members of the American Farm Bureau Federation shall control not merely the marketing of grain, live stock and dairy products, but shall control the amount of production. No committee and no organization should be in a position to control the grain crop of the United States.

"Such action by the American Farm Bureau Federation is particularly antagonistic, when it is known that the county agents of the Department of Agriculture are—and I quote the president of the American Farm Bureau Federation—the keystone of the federation. Mr. Howard insists that the county agent is the strong right arm of the American Farm Bureau Federation. This county agent receives one-half of his salary from the Department of Agriculture and the other half from the state agricultural college, being a combination state and federal officer, paid from the taxes received by the Federal government and state governments. If this county agent is to use his influence and power for the purpose of restricting the production of foodstuffs, I believe that these county agents should immediately be detached from the Federal payroll."

March 19, 1921.

Pennsylvania Farmer

5-325

Congressman Gould objects to the "attempted dictation to Congress by the American Farm Bureau Federation in the matter of legislation," "Heretofore," he says, "such dictation has invariably been attempted by the American Federation of Labor, but now we find this American Farm Bureau Federation attempting the same tactics, and this American Farm Bureau Federation, it must be remembered, has as its nucleus county agents paid out of Federal funds and out of Federal taxes. Nothing will produce discontent, unrest, and even Bolshevism quicker than an attempt to limit the food production of the United States, boost the prices and compel the people to pay double what they ought to pay for their food. I shall insist upon this investigation in the next Congress, and I shall continue to act until this conspiracy against the people is ended. We can at least divorce those who inspired this conspiracy from the public payroll."

Commenting upon Congressman Gould's resolution and statement, Gray Silver, Washington representative of the American Farm Bureau Federation, says:

"All congressional investigation of farm organizations conducted in a fair-minded way and with a view to securing all the facts, will be welcomed by the American Farm Bureau Federation, and every effort made to assist in any way possible. The American Farm Bureau Federation has no secrets and operates entirely in the open. It is built upon the voluntary membership support of a million and a half forward-looking farmers who are endeavoring to improve agricultural conditions and increase production thru co-operation and co-ordination of efforts along lines consistent with permanent production. This is a privilege and a right open to every citizen of the United States and further investigation of the federation can only serve to convince larger numbers of its solid basis and its sincerity and integrity of purpose. Neither the federation nor the committee of seventeen has adopted any policy of limiting production or fixing prices.

"All who are well informed and intimately acquainted with the organization and functions of the local county farm bureau units, fully understand the relationship of the county agricultural agent to the farm bureau. They know that the farm bureau is the only organization which universally supports and makes effective the work of the county agent in his endeavors to increase production. They know that the duties of the county agent are entirely separate and distinct from those of the farm bureau officers. And finally they know that instead of using government funds to support the farm bureau the farm bureau contributes heavily to the county agent's financial support, and uses its own funds in carrying out educational demonstrations. Any attempt on the part of Congress to interfere with the legitimate functioning of the county agricultural agent would react to the detriment of both the consumers and the producers."

—E. E. Reynolds.

HARRISBURG LETTER

The Constitutional Convention.—While one can get almost any kind of a prediction about legislation on Capitol Hill these days there appears to be a growing impression that the bill for a constitutional convention vote will be passed. Opposition to the partisan proposition has not moved the state administration and as men inclined to criticize its financial policy are disposed to go along on the constitutional bill it may become a law before long.

Educational Bills In.—The state's educational bills are in hand. The last came in today and it is now up to the Legislature to provide the money, it being taken for granted the Finnegan schedule will pass. However, there is some stir over the length of term bills and various others which have been much discussed. The latest estimate is that the educational end of the government would like to add \$10,000,000 to what it got last year. It may get \$6,000,000.

New Dog License Plan.—A new scheme for dog licenses which would take issuance of licenses off the shoulders of county authorities and make licensure of canines a state affair, just like the hunters' license system, has been evolved. County treasurers would issue the licenses and get a dime for each sold, the rest of the money going to the state. Commissioners in many counties are not opposed to this plan as it would rid them of the trouble of enforcement and pass it on to the state which could finance the prosecution of people refusing to license dogs out of the proceeds.

Agricultural Bills In.—The bulk of the agricultural bills are in hand. The State Fair bill came in Monday and owners of small fairs and large ones are preparing to fight it; the bill for assessors to make reports on acreage and crops is in hand as well as bills stiffening penalties for the violation of quarantines or horticultural or potato wart violations are under way. The bill to permit payment of men and teams for tearing out weeds at the prevailing market rates has been favorably reported.

Pure Seed Bill.—The pure seed bill, which

makes a new standard for seeds in the state and is designed to increase the penalties for the sale of seeds not reasonably clean is to be pushed by the state administration. Considerable time has been spent on this measure and it is believed it can be made to pay the farmers of the state within a year or so. The present seed law has been taken as a base and experience of the last few years has furnished ideas for changes.

The Milk Hearing.—Probably one of the most important hearings held in a long time was that on the Cook milk bill, designed to prevent adulteration. People engaged in the condensed milk and similar lines brought experts here and the whole subject of milk was discussed for hours.

Bee Bill Reported.—The bill regulating the shipment and other matters connected with bee culture has been favorably reported to the House and is expected to pass. The bill is declared by state experts to be essential if the growing industry is to be properly protected from diseases.

Bids Asked on Roads.—Bids on 100 miles of road will be asked by the State Highway Department immediately. Most of the contracts are work on which the state rejected bids last month, offering a very interesting study whether contractors who have criticised the department action in demanding lower bids will go after the work or not.

Helping Wool Growers.—Plans are being made for the state to give some expert aid in handling the wool crop. A considerable quantity of the wool is being held in storage, but the state has been listing local buyers and means to get the crop moving are being studied.

NEW YORK LETTER

Voice of Communities.—The New York State College publishes a bulletin on the country week-

Effects of a State Fair

THE OPPONENTS of a State Fair for Pennsylvania, the officials of certain county fairs, have contended that a State Fair would tend to detract from the value and success of county fairs. While all who have any knowledge of the matter know this to be a groundless fear, yet the publication of the following extract from a letter written by the secretary of a big county fair in Ohio where they also have a magnificent state fair may help to reassure the minds of the fearful:

"Our fair grounds are 30 miles from the Ohio State Fair grounds, and I consider the State Fair more of a help than a detriment to our fair, as I think it gives fair-life to the people and thereby helps all county fairs."

(Signed) W. T. MCLENNAGHAN,
Secretary Fairfield County
Agricultural Association.

lies, saying they cannot well be dispensed with. There are 439 newspapers published in 375 villages not having a daily paper. This is a four per cent decrease from the number in 1915. These papers speak for the communities in an increasingly efficient way, since the college began its service to the weeklies. The need of more farm news is stressed by the college, which also teaches the best make ups for the various pages.

Farm Bureau's Tenth Birthday.—On March 20 President John Howard of the American Farm Bureau Federation will assist in celebrating the tenth birthday anniversary of the Farm Bureau. The first one was established in Binghamton 10 years ago, with J. F. Barron, now of the State College in charge. Over six counties were served by the first Bureau.

Care of Herds.—Dr. U. A. Moore, of the State Veterinary College, urges herd owners who have just given the tuberculosis test to secure the bulletin just issued by the college advising as to after care of such herds. Testing for TB is being pushed very rapidly in a number of counties. Milk Dealers Convicted.—Eleven milk dealers of Brooklyn have been convicted of selling milk and cream adulterated with coconut oil. They paid \$4850 in fines.

Teasel Contracts.—Onondaga county teasel growers have contracted to sell 30 acres of teasels in 1921 and 67 acres in 1922. Teasels produce about 1000 pounds to the acre, and bring about 35 cents a pound.

Must Carry Over Hay.—The state led in hay production this year. Recent estimates show that 60 per cent of the commercial crop must be carried over into next year for lack of demand. Freight rates are now so high as to discourage shipping amounting to about one-half the selling price. Freight, baling costs and commission are

said to total about \$14 a ton if sold in leading markets. Rapid deflation in the West filled eastern markets with cheap hay before the eastern crop was sold and New York growers see no hope for next year's prices unless it proves a very short crop.

Ash Timber Valuable.—Several counties of New York are furnishing ash that weighs more in proportion to bulk than any other ash in the world. Twenty-five carloads are leaving Cortland County \$60 a thousand feet in the log. It is cut into 38-inch bolts, and used for making baseball bats. A shipload of bats was recently sent to Australia, made of this heavy timber. The growing of ash trees should be encouraged and all young trees cherished.

Basket Willow Crop.—Farmers of Gates and Chili are cutting their season's green willow crop at \$38 to \$45 a ton. Three tons to the acre is a good yield, and the crop is grown on swamp land.

Prize Garden.—Kenneth Cook of Dunkirk has been awarded first prize of \$25 for the best garden project in New York state. He produced \$932.50 worth of garden products on 1½ acres of land at a cost of \$639.

Profit in Purebreds.—Ormsby Sensation, a purebred Holstein bull has been sold for \$20,000, to Beaver Dam Farms. Eighteen months ago he sold for \$4000.

NEW JERSEY NEWS

There is a strong belief here that sine die adjournment of the 1921 session of the New Jersey Legislature will take place about Thursday of the week beginning March 23. No action has been taken by the Senate in the way of voting on the Eldridge Daylight Saving bill, and the fact that in New York, Governor Miller has signed the repealer to the daylight saving proposition, may have quite some bearing on what the members of the Upper House may do on the bill. Indications point to Governor Edwards vetoing the Case State Constabulary measure, which has passed both the House and Senate, but it will most likely be passed over his signature of disapproval much to the satisfaction of the farmers of the state. While there has been much opposition to this measure on the part of residents of the populous centers on the ground that the cities would have to bear as much of a tax burden as the people in the rural sections in supporting this police force, the strength that was thrown to the proposition by the agriculturists had the effect to a large extent to it being acted upon in a favorable manner by the lawmakers.

In the long list of bills that was passed within the last week in the House were the following: authorizing the establishment by the Fish and Game Commission of a game reserve in Warren and Sussex counties, both of which are rich in farmlands; permitting boards of freeholders to offer a reward of \$5000 for the arrest of a person guilty of murder, burglary, robbery, etc.; controlling interest rate on property sold for taxes; prohibiting state or county officials from serving on juries; providing a uniform method of procedure for the making of applications for state aid in the construction of township roads; providing for temporary financing by fourth class counties; providing that lists of jurors and copies of indictments be furnished defendants in certain cases; authorizing the State Commissioner of Education to name a county medical examiner; fixing the season for the killing of deer from December 15 to 20 which reduces the period five days; authorizing recorders and mayors try cases for violation of the fish and game laws; requiring that a detour road be placed in proper condition when another road is closed temporarily; regulating killing of foxes; forbidding aviators from flying over spectators at county fairs and similar outdoor exhibitions at a less altitude than 2,000 feet. Among the bills recently passed by the Senate were: providing for women on grand and petit juries; providing for women on juries in small cause courts; providing for women on district court juries. Governor Edwards has sent to the Senate for confirmation as full term members of the New Jersey State Highway Commission the names of Colonel A. S. L. Doughty, who is very well known among the farmers in Burlington County from which section he hails, and that of George L. Burton, of Middlesex County. No action has been taken on the appointments so far. Burton has been the chairman of the commission for some time. He is a Democrat while Doughty is a Republican.

Farm Stocks Greater.—Despite the fact that the farmers in this state have shipped more grain than usual during the past year the stocks on hand on March 1 with the exception of wheat were greater than the average for the past ten years. This is said to be due to the unusually large crops of last year.

Cash Rents Reported.—The following are the average cash rents paid by farmers in New Jersey, as reported from several hundred correspondents from thruout the state: average cash rent paid for typical rented farm, \$570; average value of such farm, \$8,800; average size of farm, 88 acres; average cash rent paid for plow fields per acre, \$8; average value per acre of such fields, \$93. It is said that comparatively few farms are rented for cash in New Jersey, the general plan being a share basis.

James Carriers Make Cleaning Easy

HOW do you do your chores—the old way or the James Way? The old way—cleaning out the barn is the dirtiest and hardest work on the place, a chore that is shirked by every one who has a chance to get away from it.

But this task, like many other tasks in the dairy barn, has been changed by James to a chore that even the boys like, and which they can do as well as the strongest man.

A 320-page book tells all about the James carriers and other work-saving James devices such as James cow stalls and stanchions, steel pens, ventilators, drinking cups, bull staffs, and it also tells about the James Barn Plan Service.

James Mfg. Co.

Elmira, New York

The book is sent free, if you ask for James Way book No. 26

Ventilation of the Dairy Barn

By A. L. BEAM

USUALLY during the winter season some trouble is experienced in properly ventilating the dairy barn. That is, supplying sufficient pure fresh air and allowing the moist foul air to escape without making the barn too cold or causing drafts on any of the animals. Certain indications definitely point to a good or poor system of ventilation which are noticeable as soon as one enters a barn. In some cases the walls and ceilings of a barn are covered with moisture and the air has a penetrating chilliness which is not found in other barns in which the warm moisture laden air is systematically disposed of thru outlet flues.
